PREFACE

This volume represents the second to appear in the series of Tables of Data prepared by the present author. It presents in organized and conveniently usable form a summary of data on a selected list of organic compounds containing carbon and chlorine, or carbon, oxygen, and chlorine, or carbon, hydrogen, and chlorine, or carbon, hydrogen, oxygen, and chlorine. Such compounds may more briefly be described as comprising Order 3.

Although users of its predecessor will immediately recognize many aspects of similarity in this book, they will also note in this volume certain differences. These distinctions are more fully discussed in Chapter I, but certain general aspects may be noted here.

Whereas the treatment of Order 1 compounds was directed mainly toward the aspect of identification, and though this point of view is vigorously continued, the present treatment of compounds of Order 3 has been expanded to include also the preparation, properties, and general chemical behavior of the individuals selected for treatment.

A second major difference from the earlier volume is in the extent of reference to the original literature or the corresponding abstracts thereof. This documentation is carried to a degree which may suggest to organic chemists that this volume comprises a Beilstein. The author hastens to disclaim any such degree of completeness for this work but does admit that for each compound selected a meticulous search of the literature through 1945 has furnished the basis for appropriate selection and systematic grouping of the aspects to be treated.

A third important difference from the earlier volume is the inclusion of references to patents as well as scientific articles. Though such patent references are treated with reserve, it is believed that they will be of interest to all users and of special value to industrial chemists. Throughout the book emphasis is given to industrial aspects since the rapid growth of this field during the last two decades, particularly in the United States, has resulted in the production and large-scale utilization of many individual compounds of this order (3).

A fourth type of difference in the present treatment as compared with that of Order 1 is seen in the tabulation of physical constants. In the earlier volume an attempt was made to select the "best" values. This process tended to conceal the magnitude and nature of the available constants from

CONTENTS

ABBREVIATIONS

	A
$[\alpha]_D^{20}$	specific rotation at 20° for D line
Ā	represents acid residue in whose description it occurs
abs.	absolute; absolutely
abt.	about
abund.	abundant
abv.	above
Ac	acetyl radical, i.e., $CH_3.CO$—
AcOEt	ethyl acetate
AcOH	acetic acid (glacial acetic acid when unmodified)
Ac_2O	acetic anhydride
ac.	acid
acc.	according
acid.	acidify, acidified, acidification
act.	active
addn.(l)	addition (additional)
adj.	adjacent (e.g., 1,2,3)
alc.	alcohol (95% unless otherwise stated); alcoholic
ald.	aldehyde
alk.(y)	alkali; alkaline; (alkalinity)
alm.	almost
Am	amyl
ammon.	ammoniacal
amorph.	amorphous
amt.(s)	amount(s)
anal.	analysis; analyses
anhyd.	anhydrous
anti-	anti (stereomeric opposite of *syn-*)
apprec.	appreciable; appreciably
approx.	approximate; approximately
aq.	water or aqueous
arom.	aromatic
assoc.(d) (n)	associate(s) (associated) (association)
	B
B̄	represents a molecule of the "basic" salt-forming compound in whose *description* it occurs
B.B.No.	bromide-bromate number
bibl.	bibliography
bkn.	"broken" (cf. color terminology)
boilg.	boiling
b.p.	boiling point (at atm. pressure unless specified)
Bu	*n*-butyl
bril.	brilliant
brn.	brown
Bz	benzoyl, i.e., $C_6H_5.CO$—
BzOH	benzoic acid
	C
C	Centigrade degrees
C̄	used to designate the compound in whose description it occurs
calc.(d) (n)	calculate(d) (calculation)
cap.	capillary
cat.	catalyst; catalytic; catalyzed
cc.	cubic centimeter(s)
cf.	compare
cg.	centigram(s)
charac.	characteristic
chem.	chemical
cis-	stereochemical opposite of *trans-*
cm.	centimeter(s)

coeff.	coefficient
col.(n)	*color (coloration)*
comb.(d) (n) (g)	combine(d) (combination) (combining)
comml.	commercial
compd.	*compound*
compn.	composition
conc.(d) (n)	concentrate(d) (concentration)
condens.	condensation
cond.	condition(s)
confrm.(n)	confirm; confirmatory (confirmation)
const.	constant
cont.(s) (g)	contain(s) (containing)
conv.(n)	convert (conversion)
cor.	corrected
corresp.	corresponding
C.P.	chemically pure
cpd.	compound
crit.	critical
cryst.(n) (d)	crystal(s); crystallize(s) *(d); crystalline* (crystallization)
C.S.T.	critical solubility temperature

D

Ⓓ	derivative (used to introduce important derivatives for specific characterizations)
(D)	dark (following name of a broken color)
D_4^{20}	density at 20° referred to water at 4°
d-	dextrorotatory
dec.(d) (n)	decompose(s) (decomposed) (decomposition)
deliq.	deliquesce(s), deliquescent
depolym.(d) (n)	depolymerize(s) (depolymerized) (depolymerization)
deriv.(s) (d) (n)	derivative(s) (derived) (derivation)
desic.	desiccator; desiccated
detectn.	detection
detn.(d)	determine; determination (determined)
diam.	diameter
dif.	*different; difference; difficultly*
dil.(td) (tg) (n)	dilute (diluted) (diluting) (dilution)
dimin.	*diminish; diminishing; diminished; diminutive*
dis.(lvd)	dissolve (dissolved)
dissoc.(d) (g) (n)	dissociate(d) (dissociating) (dissociation)
dist.(d) (g) (n)	distil(led) *(distilling)* (distillation)
distrib.(n)	distribute *(distribution)*
div.(n)	divide (division)
dk.	dark
d,l-	racemic (by external compensation as contrasted with *meso*)
D.V.	Duclaux Value

E

eas.	easily
efferv.	effervesce(s); effervescent
equiv.	equivalent
espec.	especially
est.(d) (g) (n)	estimate(s) (estimated) (estimating) (estimation)
Et	ethyl, i.e., $CH_3.CH_2$—
EtOH	ethyl alcohol (generally refers to 95% if unmodified)
eth.	ether (generally means ordinary diethyl ether)
evap.(d) (g) (n)	evaporate(d) (evaporating) (evaporation)
evol.(n)	evolve(s) (evolution)
exam.(d) (n)	examine(d) (examination)
expt.(l)	experiment(al)
ext.(d) (g) (n)	extract(s) (extracted) *(extracting) (extraction)*

F

filt.(n)	filter(s); filtrate (filtration)
floc.	flocculate; flocculent
fluores.	fluoresce(s); fluorescent

f.p.	freezing point
freq.	frequently
fract.(n) (nl)	fraction; fractionate (fractionation) (fractional)
fum.	fumaroid (stereochemical opposite of *maleinoid*)
fumg.	fuming
fus.(n)	fuse(s), melt(s); fusible; fusing (fusion)

G

g.	gram(s)
gem.	geminate (said of two like groups attached to same atom)
geom.	geometrical
glac.	glacial
gr.	green
grad.	graduate; graduated; gradually
gran.	granular; granulated

H

H.E.	hydrolysis equivalent
hexag.	hexagon, hexagonal
hr.(s)	hour(s)
ht.(d) (g)	heat(ed) (heating)
hydrol.(g) (zd)	hydrolyze; hydrolysis; (hydrolyzing) (hydrolyzed)
hygros.	hygroscopic

I

ibid.	in the same place
ident.	identical; identity
identif.(d) (n)	identify (identified) (identification)
i.e.	that is
immed.	immediate; immediately
impt.	important
inact.	inactive; inactivated
indef.	indefinite
indic.	indicate; indicator; indicated
inf.	infinite
inorg.	inorganic
insol.(y)	insoluble (insolubility)
irreg.	irregular
irrit.(n)	irritating (irritation)
isom.(d) (n)	isomer; isomerize (isomerized) (isomerization)

K

k	ionization constant

L

(L)	Light (modifying name of a broken color)
l-	laevorotatory
l.	liter(s)
lft(s).	leaflet(s)
lgr.	ligroin
liq.	liquid; liquefy
lt.	light (of a color)

M

(M)	medium (modifying name of a broken color)
m.	melt(s)
m-	meta
mal.	maleinoid (stereochemical opposite of *fumaroid*)
max.	maximum
Me	methyl, i.e., CH_3—
MeOH	methanol, i.e., CH_3OH
m.e.	milliequivalent
mg.	milligram(s)
mic.	micro
microcryst.	microcrystalline
min.	minute(s); minimum
minl.	mineral
misc.	miscellaneous; miscible
mixt.	mixture(s)
mod.	moderate
modifn.	modification
mol.	molecular
monoclin.	monoclinic
ml.	milliliter
mm.	millimeter
m p.	melting point
ms	meso-

N

N	normal (equivalents per liter)
n	normal
n_D^{20}	refractive index at 20° for D line of sodium
ndl.(s)	needle(s)
neg.	negative
Neut. Eq.	neutralization equivalent
neut.(zd)	neutral (neutralized)
no.	number
non-fus.	non-fusible
non-vol.	non-volatile

O

o-	ortho
obs.(d) (n)	observe(d) (observation)
obt.(d)	obtain(ed)
opt.	optical
optim.	optimum
or.	orange
ord.	ordinary
orig.	original; originally
org.	organic
oxid.(g) (n)	oxidize(s) (oxidizing) (oxidation)

P

Ⓟ	preliminary test
p-	para
perm.	permanent
pet.	petroleum
Ph	phenyl, i.e., C_6H_5—
phys.	physical
physiol.	physiological
Pk	picryl, i.e., 2,4,6-trinitrophenyl-
PkOH	picric acid
pl.	plate(s)
polym.(n)	polymer; polymerize; polymerized (polymerization)
pos.	positive
powd.	powder; powdered
ppt.(d) (g) (n)	precipitate(d) (precipitating) (precipitation)
Pr	propyl
pr.	prism(s)
pract.	practically
prep.(d) (g) (n)	prepare(d) (preparing) (preparation)
pres.	presence
press.	pressure
prim.	primary
prin.	principal
prismat.	prismatic
prob.	probably
proc.	procedure
prod.	product; produce; produced
prop.	property; properties
pt.(s)	part(s)
pulv.(d)	pulverize(d)
pung.	pungent
purif.(d) (g) (n)	purify (purified) (purifying) (purification)

Q

quad.	quadratic
qual.	qualitative; qualitatively
quant.	quantity; quantitative; quantitatively
quat.	quaternary
q.v.	quod vide (which see)

R

rac.	racemic
rap.	rapid; rapidly
reactn.	reaction(s)
reagt.(s)	reagent(s)
rearr.	rearrange(s); rearrangement
recommd.	recommend; recommended
recryst.(d) (g) (n)	recrystallize(d) (recrystallizing) (recrystallization)
rect.	rectangular
redis.	redissolve
reduc.(d) (g) (n)	reduce(d) (reducing) (reduction)
ref.	reference
reminis.	reminiscent
reppt.(d) (g) (tn)	reprecipitate(d) (reprecipitating) (reprecipitation)

resid.	residue; residual
resin.	resinify; resinification
resp.	respectively
rhomb.	rhombic

S

Sap. Eq.	saponification equivalent
sapon.(d) (g) (n)	saponify (saponified) (saponifying) (saponification)
sat.(d) (g) (n)	saturate(d) (saturating) (saturation)
sec.	second(s)
sec.	secondary
sect.	section
sep.(d) (g) (n)	separate(d) (separating) (separation)
sft.(n)(s)	soft; soften(s)
shak.(g) (n)	shake (shaking) (shaken)
sint.(d)	sinter(s) (sintered)
sl.	slightly
sld. cap.	sealed capillary
S.N.	system number (Beilstein)
spar.	sparing; sparingly
sol.(n) (y)	soluble (solution) (solubility)
solv.	solvent(s)
sp gr.	specific gravity
sq.	square
subl.(g)	sublimes; sublimate; subliming; sublimation
subl. w.m.	sublimes without melting
subseq.	subsequent
subst.	substance; substantially; substituted
suff.	suffices; sufficient
supersat.(d)(g)(n)	supersaturate(d)(supersaturating) (supersaturation)
st.	steam
s t.	sealed tube
stdg.	standing
sym.	symmetrical
syn-	stereochemical opposite of *anti-*
syst.	system; systematic; systematically

T

T	Numbered Test
tbl.(s)	tablet(s); tabular
tech.	technical
temp.	temperature
theor.	theoretical
therm.	thermometer
T.N.B.	1,3,5-trinitrobenzene
T.N.T.	2,4,6-trinitrotoluene
ter-	tertiary
trans-	stereochemical opposite of *cis-*
transf.	transfer; transform
tt.	test tube

U

u.c.	uncorrected
undec.	undecomposed
undislvd.	undissolved
unoxid.	unoxidized
unsat.	unsaturated
unsym.	unsymmetrical
U.S.P.	United States Pharmacopœia
u.v.	ultra violet

V

vac.	vacuum
vap.	vapor; vaporize
var.	variable
vic.	vicinal (adjacent)
vig.	vigorous; vigorously
viol.	violent; violently; violet
visc.	viscous
volat.(g) (n)	volatile (volatilizing) (volatilization)
volumin.	voluminous

W

warm.	warming
wh.	white
wt.	weight

Y

yel.	yellow

MEMORANDUM OF CERTAIN 1946–1947 REFERENCES NOT INCORPORATED IN REGULAR TEXT

The regular text of this book is made up of references selected from the chemical literature through the year 1945. Owing to the disturbed postwar conditions of the publishing and printing trades, and also to the exceptional difficulty and magnitude of this work, almost three years have elapsed since the termination of the period of writing of the organized text. Inevitably, there have appeared during this period many scientific papers whose content would gladly have been incorporated appropriately in the regular text. For practical reasons, however, such continuous adjustment was obviously impossible.

In an effort to avoid so far as possible complete loss of such material, however, certain of the more important papers which have come to the attention of the author during the 1946–1947 period have been listed in the following supplementary bibliography. Articles relevant to more than a single numbered compound are cited under the first in such a numerical series, cross-references being given under subsequent compounds to avoid excess duplication of references. In the interests of brevity, clarity, and consistency of nomenclature, slight modifications of the actual titles of the original papers have sometimes been made for purposes of this listing.

General

(1) Table of azeotropes and nonazeotropes
Horsley, *Ind. Eng. Chem., Anal. Ed.* **19**, 508–600 (1947)
[illegible] its accompanying formula index and [illegible] valuable and includes so many of the [illegible] that it is placed at the head of this supplementary reference list without further cross-reference to it from subsequent entries below.

3:0075 **δ-Chloro-*n*-valeric acid**

(2) Isomeric chlorinated long-chain esters
Guest, *J. Am. Chem. Soc.* **69**, 300–302 (1947)
—**Methyl δ-chloro-*n*-valerate:** b.p. 89–92° at 18 mm. [From δ-chloro-*n*-valeronitrile 80% H_2SO_4 refluxed 50 hr.]

3:0235 **α-Chloroisobutyric acid**

(3) The chloro- and bromoisobutyronitriles
Stevens, *J. Am. Chem. Soc.* **70**, 166 (1948)
Ⓓ **α-Chloroisobutyramide:** cryst. from EtOAc, m.p. 115–118°; from aq., m.p. 117–119°. [From α-chloroisobutyryl chloride (3:5385) with conc. NH_4OH at 10° in 70% yield]

3:0280 **Chloromaleic anhydride**

(4) Use of Ĉ in determination of conjugated diolefins
Putnam, Moss, Hall, *Ind. Eng. Chem., Anal. Ed.* **18**, 628–630 (1946)

3:0460 *β*-**Chloropropionic acid**
(5) Convenient synthesis of *β*-chloropropionitrile (from acrylonitrile with hydrogen chloride)
Stewart, Clark, *J. Am. Chem. Soc.* **69**, 713–714 (1947)

3:0885 *α*-**Chloro-diphenylacetyl chloride**
(6) $\overline{C}$ as reagent for preparation of benzilic acid esters of tertiary amino alcohols
King, Holmes, *J. Chem. Soc.* **1947**, 164–168; *C.A.* **41**, 5121 (1947)

3:1150 Trichloroacetic acid
(7) Kinetics of the decomposition of certain salts of $\overline{C}$ in ethanol-water mixtures
Hall, Verhoek, *J. Am. Chem. Soc.* **69**, 613–616 (1947)
(8) Kinetics of the decomposition of $\overline{C}$ in formamide-water mixtures
Cochran, Verhoek, *J. Am. Chem. Soc.* **69**, 2987–2988 (1947)

3:1212 Phenacyl chloride
(9) The reaction of $\overline{C}$ with phenylhydrazine
van Alphen, *Rec. trav. chim.* **65**, 112–116 (1946); *C.A.* **41**, 409 (1947)

3:1370 Chloroacetic acid
(10) New method for the detection and determination of $\overline{C}$ (using pyridine)
Ramsey, Patterson, *J. Assoc. Offic. Agr. Chemists* **29**, 100–111 (1946); *C.A.* **40**, 3369 (1946)
(11) Effect of *p*H on rate of hydrolysis of $\overline{C}$
Berhenke, Britton, *Ind. Eng. Chem.* **38**, 544–546 (1946)

3:1420 1,1,1-Trichloro-2,2-diphenylethane
(12) Derivatives of $\overline{C}$
[illegible] –2268 (1947)
(13) [illegible] 343; *C.A.* **40**, 5040 (1946)

3:3298 1,1,1-Trichloro-2,2-*bis*-(*p*-chlorophenyl)ethane ("DDT")
(14) Methods of preparation of $\overline{C}$
Bailes, *J. Chem. Education* **22**, 122 (1945); *C.A.* **41**, 3085 (1947)
(15) Preparation of technical $\overline{C}$
Mosher, Cannon, Conroy, Van Strien, Spalding, *Ind. Eng. Chem.* **38**, 916–923 (1946)
(16) Preparation of $\overline{C}$ using HF as condensing agent
Simons, Bacon, Bradley, Cassaday, Heegberg, Tarrant, *J. Am. Chem. Soc.* **68**, 1613–1615 (1946)
(17) [illegible] (1946); *C.A.* **41**, 2409 (1947)
(18) [illegible] *ng. Chem.* **39**, 868–870, 1683 (1947)
(19) [illegible]
(20) [illegible] 5); *C.A.* **39**, 4695 (1945)
(21) [illegible] to the determination of $\overline{C}$ in water [illegible] 45); *C.A.* **40**, 2561 (1946)
(22) Field test for surface $\overline{C}$
Stiff, Castillo, *Ind. Eng. Chem., Anal. Ed.* **18**, 316–317 (1946)
(23) [illegible] **40**, 4842 (1946)
(24) [illegible] 6)
(25) Determination of *p,p′*-isomer in technical $\overline{C}$
Cristol, Hayes, Haller, *Ind. Eng. Chem., Anal. Ed.* **18**, 339 (1946)
(26) Determination of *p,p′*-isomer in technical $\overline{C}$
[illegible] *Anal. Ed.* **18**, 339 (1946)
(27) [illegible] a microscopical method
[illegible] *Anal. Ed.* **18**, 578–582 (1946)
(28) [illegible]
La Clair, *Ind. Eng. Chem., Anal. Ed.* **18**, 763–766 (1946)

(29) Determination of $\bar{C}$ as spray residue on fresh fruit by three independent methods
Wichmann, Patterson, Clifford, Klein, Claborn, *J. Assoc. Offic. Agr. Chemists* **29**, 188–190 (1946), *C.A.* **40**, 6705 (1946)
Method 1. Organic chlorine determinations
Klein, Wichmann, *ibid.* **29**, 191–195 (1946); *C.A.* **40**, 6705 (1946)
Method 2. The Shechter-Haller colorimetric procedure
Clifford, *ibid.* **29**, 195–206 (1946); *C.A.* **40**, 6705 (1946)
Method 3. 2,4-Dinitrophenylhydrazine method
Claborn, Patterson, *ibid.* **29**, 206–218 (1946), *C.A.* **40**, 6705 (1946)

(30) Decomposition and volatility of $\bar{C}$ and some of its derivatives
Wichmann, Patterson, Clifford, Klein, Claborn, *J. Assoc. Offic. Agr. Chemists* **29**, 218–222 (1946); *C.A.* **40**, 6740 (1946)

(31) –53 (1947)

(32)

(33) Determination of $\bar{C}$ by Shechter procedure, particularly in milk and fats
Clifford, *J. Assoc. Offic. Agr. Chemists* **30**, 337–349 (1947); *C.A.* **41**, 6839 (1947)

(34) Nature of the by-products in technical $\bar{C}$
Gätzi, Stammbach, *Helv. Chim. Acta* **29**, 563–572 (1946), *Experientia* **1**, 276 (1945), *C.A.* **40**, 5040–5041 (1946)

(35) Simple purification procedure for $\bar{C}$
K. H. Cook, W. A. Cook, *J. Am. Chem. Soc.* **68**, 1663–1664 (1946)

(36) Applications of infrared spectroscopy to $\bar{C}$
Downing, Freed, Walker, Patterson, *Ind. Eng. Chem., Anal. Ed.* **18**, 461–467 (1946)

(37) Some derivatives of $\bar{C}$
Backeberg, Marais, *J. Chem. Soc.* **1945**, 803–805; *C.A.* **40**, 1156, 5717 (1946)

(38) Bromine analogs of $\bar{C}$
Cristol, Haller, *J. Am. Chem. Soc.* **68**, 140–141 (1946)

(39) Crystal structure of $\bar{C}$ and relatives
Wild, Brandenberger, *Helv. Chim. Acta* **29**, 1024–1040 (1946), *C.A.* **41**, 428 (1947)

(40) Synthesis of some analogs of $\bar{C}$
Kirkwood, Dacey, *Can. J. Research* **24-B**, 69–72 (1946); *C.A.* **40**, 5717 (1946)

(41) Catalytic decomposition of $\bar{C}$
Fleaner, *J. Am. Chem. Soc* **68**, 2399 (1946)

(42) Inhibition of catalyzed thermal decomposition of $\bar{C}$
Gunther, Tow, *J. Soc. Chem. Ind.* **66**, 57–59 (1947), *C.A.* **41**, 5675 (1947)

(43) Dehydrohalogenation of $\bar{C}$
Wain, Martin, *Nature* **159**, 68–69 (1947); *C.A.* **41**, 2715 (1947)

(44) Estimation of $\bar{C}$ by methods depending upon dehydrohalogenation
Wain, Martin, *Analyst* **72**, 1–6 (1947); *C.A.* **41**, 2198 (1947)

(45) Preparation of di-(p-chlorophenyl)acetic acid from $\bar{C}$
Grummitt, Buck, Egan, *Org. Syntheses* **26**, 21–23 (1946)

(46) Reactions of $\bar{C}$ and associated compounds
Forrest, Stephenson, Waters, *J. Chem. Soc.* **1946**, 333–339; *C.A.* **40**, 5039–5040 (1946)

(47) Crystallization of $\bar{C}$ from binary melts
Gilpin, McCrone, Smedal, Grant, *J. Am. Chem. Soc.* **70**, 208–211 (1947)

3:3320 1,1-Dichloro-2,2-*bis*-(*p*-chlorophenyl)ethane ("DDD")

(48) Anhydrous $FeCl_3$ as rearrangement catalyst for some chlorinated diphenylethanes
Fleck, *J. Org. Chem.* **12**, 708–712 (1947)

3:3350 4,6-Dichlororesorcinol

(49) For preparation of isomeric 2,4-dichlororesorcinol see
Postovsky, Kuchina, *J. Gen. Chem. (U.S.S.R.)* **17**, 276–282 (1947); *C.A.* **42**, 534–535 (1948)

3:3331 *p*-Phenylphenacyl chloride

(50) Conversion of $\bar{C}$ to p-phenylphenacyl iodide
Rheinboldt, Perrier, *J. Am. Chem. Soc.* **69**, 3148–3149 (1947)

3:4093 2,4-Dichlorophenoxyacetic acid

(51) Preparation of $\bar{C}$ from phenol and chloroacetic acid
Ebel, Bell, Fries, Kasey, Berkebile, *J. Chem. Education* **24**, 449 (1947)

(52)

(53)

(54)
Freed, *J. Am. Chem. Soc.* 68, 2112 (1946)

3:4375 *p*-Chlorophenoxyacetic acid
(—) See reference (53) under 3:4095 (above).

3:4410 *cis*-1,2,3,4,5,6-Hexachlorocyclohexane
(55) Preparation of the benzene hexachlorides

are also present, a compound is said to belong to a higher order: e.g., compounds of carbon with both hydrogen and nitrogen, with oxygen and nitrogen, or with hydrogen, oxygen, and nitrogen comprise Order 2. A systematic arrangement of still higher orders has been developed but need not be fully amplified here.

The substance of the present volume is concerned primarily with compounds of Order 3, i.e., with compounds containing carbon and chlorine; carbon, oxygen, and chlorine; carbon, hydrogen, and chlorine; or carbon, hydrogen, oxygen, and chlorine. To all such compounds deemed of sufficiently general interest to warrant detailed treatment in this book, serial numbers have been assigned as later explained. Although such serial numbers are thus restricted to species of Order 3, a vast number of compounds belonging to other orders inevitably occurs in the course of the individual texts so that this volume has far wider utility than might at first glance be supposed. At the same time not all substances belonging to Order 3 are given numbers since many are not of sufficient value to warrant such extensive treatment.

2. The matter of suborders

In the general plan of ordinal classification, it is sometimes (but not always) useful to effect subdivision of orders into two suborders according to whether or not the pure compounds are colored. For both Orders 1 and 2, such subordering has special merit. For the present Order 3 compounds, however, the proportion of colored individuals is almost negligible, and employment of suborders has been avoided.

3. The arrangement of compounds of Order 3 into *divisons*

Just as the individual compounds of Order 1 were ultimately further subclassified into various *genera*, each characterized by a common behavior in certain prescribed and carefully defined *generic tests*, so it would of course be perfectly possible to set up an analogous series of genera for any or all of the higher orders. After considerable reflection and experimentation, however, such extension of the method of generic subclassification has seemed an extravagant formality whose added value for the higher orders does not warrant its establishment. Consequently, the individuals comprising the present Order 3 are not arranged by genera, and there are no standardized generic tests to be systematically applied.

Instead of arrangement by genera, therefore, the compounds assigned serial numbers in this book are arranged in three *divisions*. The first of these divisions comprises members of Order 3 which, when pure, are normally solids with at least reasonably definite melting points. The second comprises members of Order 3 which, when pure, are liquids with boiling points attainable and recorded at ordinary pressure. The third division comprises

members of Order 3 which, even when pure, are liquids which either cannot be distilled at atmospheric pressure without serious decomposition or for which such data are available only under reduced pressure. Ample cross-references connecting the solid and liquid divisions facilitate recognition of appropriate cases.

4. The sequence of compounds within the three *divisions*

DIVISION A. *The individual solids constituting Division A are arranged* in the order of increasing magnitude of their respective melting points. For compounds on which there is poor agreement regarding the true melting point, the value determining the position of the compound relative to its neighbors is not necessarily the highest listed. Values printed within square brackets have been regarded by the author on the collateral evidence as possibly doubtful, and such constants have been discounted in assigning positional sequence to the compound.

DIVISION B. This division, comprising liquids of Order 3 with boiling points at ordinary pressure, is (unlike either its predecessor or successor) further subdivided into two sections according to the specific gravity at 20°C. referred to water at 4°C. Section 1 contains such liquids with values of D_4^{20} greater than 1.15; Section 2 contains correspondingly those liquids for which the value of D_4^{20} is less than 1.15. Within each of the sections of Division B the individual species are arranged in the order of increasing magnitude of their respective boiling points, preferably at 760 mm. pressure. For compounds whose boiling points at this standard pressure are unreported, no attempt has been made to calculate over since to do so seems likely to introduce serious uncertainties.

DIVISION C. This division contains all serially numbered compounds of Order 3 *which have not been allocated to either of the preceding divisions,* such cases usually comprising liquids for which boiling points are reported *only* at reduced pressures. Within this division an entirely different method of establishing the listing sequence is employed; viz., the compounds are listed in ascending sequence according to the composition of their empirical formulas. For any given number of carbon atoms, compounds containing *carbon and chlorine, or carbon, oxygen, and chlorine, or carbon, hydrogen,* and chlorine, or carbon, hydrogen, oxygen, and chlorine fall in that sequence. Within any one of these four subgroups the sequence is determined by increasing magnitude of the number of component atoms in the sequence (as above) of carbon, hydrogen, oxygen, and chlorine. Although expressed in words this sounds formidable, even casual inspection of the Tables or of the Empirical Formula Index quickly supplies convincing evidence of its complete simplicity in actual practice.

5. The arrangement of data on individual compounds

Whether the amount of data for the compounds comprising this volume is large or small, and irrespective of numerous variations of details, a certain standard form may be recognized as common to all. This form may be construed as made up of the following five elements:

A. The heading.
B. Fundamental physical constants.
C. General data on other constants, preparation and properties.
D. Designation of special or preliminary tests.
E. Derivatives.
F. References to the original literature.

The relative amount of space devoted to these five aspects varies according to circumstances. Each is discussed below in much further detail.

A. *The heading*

The heading of each numbered compound comprises (in its most general form) five components which always occur in the following sequence from left to right, viz.,

1. Location number of compound in this book (Order 3)	2. Name (or names)	3. Structural formula	4. Empirical formula	5. Beilstein reference

(1) *The location number.* Each compound on which detailed treatment is given in this book has been assigned an arbitrary number to facilitate frequent cross reference in indexes and other parts of the text. This number consists of a digit representing the order of the compound (thus all species of this volume have location numbers beginning with 3), followed by a colon and then a four-digit arbitrary number. The system is, therefore, entirely comparable to a telephone number, the initial digit preceding the colon corresponding to an exchange, the four following digits corresponding to an individual line.

In assigning serial location numbers to the various individuals treated in this book, a principle has been maintained whose recognition greatly facilitates recognition of the physical nature of the corresponding substances. All members of Division 1 (solids) carry numbers between 1 and 4999; all members of Division 2, Section 1, are between 5000 and 6999; all members of Division 2, Section 2, are between 7000 and 8999; all members of Division 3 are between 9000 and 9999.

For a given compound, the full descriptive data are recorded only in one place, i.e., in that corresponding to the location number. When occasion

arises to be reminded in some other portion of the book of certain properties of a given compound, the *heading only* is repeated followed by a cross reference to the place of detailed description, the section usually occupied by the location number being indicated merely by a dash. The most frequent occasion for this type of cross reference is to indicate the boiling point of a compound normally met with as a solid, or alternatively the melting point of a substance normally met as a liquid.

(2) *The name (or names) of the compound.* The second element of the heading is devoted to the name (or names) of the compound. Out of all possible names, one (regarded for the purposes of this book as the "principal name") has been printed in bold-face capitals.

In many instances, however, this principal name is followed in ordinary type by one or more other names which are in common use and which might occur alternatively to users of this volume. All these names are appropriately entered in the alphabetical name index so that the location number is readily obtained irrespective of which name may be sought by the user.

(3) *The structural formula of the compound.* Since it is frequently easier to interpret the chemical reactions of a compound by contemplation of its structural formula rather than its name, such structural pictures are given for all compounds in this volume.

If a particular compound reacts as if it had two different structures, both are pictured.

Although such structural formulations are construed as the third element of the heading of each compound, it may happen that, owing to practical space considerations, the picture is not actually printed as part of the top line but depressed somewhat below it.

(4) *The empirical formula.* The fourth element of the heading is the empirical formula. This will be found useful in many ways, particularly in suggesting (especially with the amplification afforded by the empirical formula index) isomeric compounds from which distinction must be made, and in searching the abstract periodicals for data reported after the publication of this volume.

(5) *The Beilstein reference.* Each compound listed in these *Tables* carries in the upper right-hand corner as the fifth element of the heading reference to Beilstein's *Handbuch der organischen Chemie.* All such references designate the fourth edition of this important tool.

At the time of preparation of these *Tables*, all twenty-seven volumes of the primary series (covering the literature up to 1910) together with the corresponding twenty-seven volumes of the first supplementary series (1910-1919, inclusive) of Beilstein's *Handbuch* were available. For every numbered compound of these *Tables* which appears in either the main or first supple-

mentary series, the Beilstein reference will comprise two parts, the first giving the volume and page in the main series, the second giving corresponding reference to the first supplementary series. To distinguish the latter, the volume reference carries the subscript 1, and the page reference is placed between parentheses to indicate that the regular pagination of such supplementary volume is designated.

In addition to the main and first supplementary series of Beilstein mentioned above, there were also available during the preparation of these *Tables* the first five volumes of the second supplementary series (1920–1929) of Beilstein's *Handbuch*. For such of the present numbered compounds as were treated in this available fragment, the Beilstein reference will, therefore, contain a third element representing the volume and page involved. For this kind of case the volume reference bears the subscript 2 (to indicate second supplementary series) together with the page reference in parentheses as before.

In accordance with the above explanation, a given compound will have either two or three Beilstein references. It is, of course, possible for a compound to have citation to only one or two out of the three maximum possibilities; absence of any data for a particular Beilstein unit is indicated by short dashes after the volume number.

The remaining possible case is that in which the compound in question is of such recent origin that Beilstein contains no reference to it either in the main section or either supplementary series. Many such compounds occur in this Order 3. Under these circumstances the usual Beilstein citation is replaced by the Beilstein System Number of the compound, e.g., Beil. S.N. 644. Such type of reference immediately indicates that no reference to the substance is contained in any Beilstein issues through Vol. V of the second supplementary series. Whenever third, fourth, or later supplementary series become available, however, this system number will indicate the position of the compound within narrow limits, even though volume and page cannot now be predicted.

The practice of giving all three Beilstein citations wherever possible serves as a continual reminder that to look merely in the main series volume of Beilstein yields material only up to 1910; for the next two decades the corresponding first and second supplements must also be examined. In this respect these *Tables of Order* 3 extend the practice of those of Order 1, where only the main series citation was made, extension to the first supplement being left to the user.

That these references to Beilstein's *Handbuch* are here included only as an additional convenience to users of these *Tables* should be clearly understood. This book is wholly independent of Beilstein, and those users to whom Beilstein may be inaccessible are reassured that the value of these *Tables* to them is in no way impaired.

B. Fundamental physical constants

The five components of the standard heading having been discussed, some comment upon the next element of each description is required. This next element comprises what are here designated as "fundamental physical constants" and which in the most general cases consist of data on (1) the melting point, (2) boiling point, (3) density, and (4) refractive index. In the sequence named, these are arranged in four vertical columns from left to right of a given page. For substances which are solids under ordinary conditions, the melting-point column is the first at the left of the page with the boiling-point column next following in the left central section. For such solids only rarely will density or refractive index data appear. For liquids, however, the first left-hand column is devoted to boiling-point data, the melting points being displaced to the next right-hand column because of their subordinate value in such instances.

(1) *The melting point.* Whereas in the earlier *Tables of Order* 1 the general practice was to express only a single figure for this constant, the individual descriptions of this book include substantially all values that have been reported. However, values which in the light of collective subsequent results are certainly too low, or those which because of their wide range make no claim to accuracy, are omitted. The survey of values thus set forth, together with the fact that the source of each value is also given, permits the user to form his own opinion concerning the magnitude, degree of concordance, and precision of the available data.

For each individual compound the several values are arranged in the order of diminishing numerical magnitude. In general the value of highest magnitude is employed to determine the place of the individual solid relative to its fellows (i.e., to determine its serial location number). However, values enclosed by square brackets are regarded by the author on collateral evidence as being abnormally high, and such constants are ignored in establishing the serial number of the individual.

The several melting points are recorded here just as they are reported in the original literature; whenever the designations *corrected* or *uncorrected* were included in the original source, they are repeated here; most of the values, however, fail to specify whether they are corrected or not. This careless usage of much journal literature is to be deplored.

No attempt has been made in this book generally to maintain a distinction between melting point and freezing point. Undoubtedly, most of the values reported represent conventional capillary-tube melting points; frequently, however, the values are expressed to a degree of precision suggesting that a cooling-curve method was employed. Whenever the distinction is of importance, the user can readily ascertain full details from the cited references.

(2) *The boiling point.* In complete analogy with its treatment of melting points, the individual descriptions of this book include substantially all recorded values of the boiling point. These are tabulated in the order of diminishing numerical magnitude of the prevailing pressures. Wherever the data can be found, the value at 760 mm. pressure is cited; however, if this is not directly reported, no attempt has been made to convert the available figures over to that pressure, as to do so would introduce unwarranted assumptions. Values of the boiling point at various pressures are meticulously included in the *Tables*. However, when a careful physicochemical study has been made of the vapor pressure of an individual, selected values are printed and reference made to the original for further detail.

Even a casual examination of the boiling point data reported in this book leads at once to the conviction that there has been a great variation in the precision of measurement of the prevailing pressure over the boiling liquid. In fact an incredible proportion of workers has not reported any pressure figures at all or complacently referred to the "prevailing atmospheric pressure." Even when pressure measurements are reported, the evident general lack of concordance becomes distressing evidence of the inadequacy and inaccuracy of many of the data in the literature.

(3) *Densities.* Unlike the extensive treatment accorded for melting points and boiling points, this book does not attempt to tabulate all possible published values for the densities of liquid compounds. However, all available data for density at 20°C. referred to water at 4°C. are given; and, whenever possible, the same procedure is extended to values for D_4^{25} and D_4^{15}. Note that, when values are given for various temperatures, those for the highest temperature are printed at the top of the density column, followed in diminishing magnitude of temperature by the other values. This simple and obvious device is intended to assist users of these *Tables*, but they should be reminded that this plan was not (unfortunately) employed with the *Tables of Order* 1.

Density data are given for all liquids for which they can be found; for compounds normally solid, the density is occasionally given for some temperature above the melting point, especially if refractive index values at the same temperature are also available.

Whenever in an original paper there exists any uncertainty as to the temperature of the water with which comparison is made, the lower subscript is replaced by a short dash to indicate that the omission of this figure is not accidental but is because of inadequate expression in the original. In many or even most such cases it is possible that the author intended to convey that the density was expressed with respect to water at the same temperature. This author, however, declines to make any such assumption and ventures to express the view that research workers and journal editors should insist upon unambiguous expression of such data.

(4) *Refractive indices.* These are usually given in the form n_D^{20}, i.e., the refractive index determined at 20°C. with the D line of sodium light. In some instances data for other lines of the spectrum have been reported here when no data on the D line were available. As with the densities above, refractive index data are frequently printed for other temperatures, and the same typographical convention of placing the higher-temperature values above the lower-temperature ones is continued.

C. General data on other constants, preparation, and properties

The preceding details of the five components of the heading and the four so-called fundamental constants having been discussed, it is now desirable to comment upon the third element of the text of each compound. The material comprising this third section actually comprises most of the space of this book. Although sometimes consisting of only a few paragraphs, there are many members of Order 3 for which the general exposition of behavior requires many pages. Such extended treatments are frequently (although not invariably) subdivided by major and minor headings intended to facilitate quick recognition of the probable location of particular types of desired information. Careful examination of the text of any typical individual compound will quickly disclose that it has in general been dealt with in generous fashion. At the same time it is obvious that a line must be drawn somewhere. For example, in connection with the discussion of an alkyl halide such as *n*-butyl chloride, it is certainly of highest relevance to indicate the mode and extent of its ability to form *n*-butyl magnesium chloride. Furthermore, the value of the simpler reactions of the RMgCl compounds, particularly with reference to their utility in the identification of the initial halide itself, is evident, but on the other hand no attempt has been made to cover all the known reactions of butyl magnesium chloride since that would involve an undertaking of disproportionate magnitude.

Although details of the texts of individual compounds naturally differ in nature and magnitude and are influenced by the literature content corresponding to the direction of published research, certain aspects occur with sufficient frequency to warrant comment.

The text of each compound invariably comprises its methods of preparation and its chemical behavior. For many of the more common or especially important species, these two aspects are often preceded by an introductory section containing certain physical data (in addition to that of the heading) likely to be of particular interest or utility to organic chemists. Examples of such entries include binary and ternary systems with other compounds, especially with reference to freezing-point composition data, azeotropes, densities and/or refractive indices, etc. In this introductory section also attention is frequently directed to methods of quantitative determination

of the compound, examples of industrial or other utilization, biochemical behavior especially with regard to studies on toxicity, antiseptic character, etc. The selection of entries for this introductory section is admittedly arbitrary, and users are reminded that this book makes no claim to include all known data even on the compounds to which serial numbers are assigned. Indeed, in an effort to keep the volume within reasonable bounds, certain types of data of value to organic chemists have been deliberately (though regretfully) excluded, such as references to absorption or Raman spectra, dipole moments, and viscosities, although many instances of the four fundamental physical constants of the heading are drawn from original publications primarily concerned with these aspects.

Within the text of each individual numbered compound (immediately following the above-mentioned introductory section, if any), there occurs a section on its methods of preparation. This treatment has purposely been made as complete as possible. To a limited degree distinction has been made between preparation and formation; but, because even in contemporary publications many authors fail to report yields, adequate recognition of the appropriate category is not always possible. Original results reported only in terms of weight have been calculated over to percentage yields. Variations in yields by a single method of preparation are contrasted by massing them in the text, the uniform practice of following each statement with its corresponding citation serving conveniently to associate each yield with a particular modification. With compounds for which there are many modes of preparation, the most generally practicable methods are often singled out for particular mention at the beginning of the preparative section, followed by a systematic presentation of all the recorded methods under various subheadings appropriate to the circumstances.

Users of this book will find these sections on preparation not only extremely useful from the viewpoint of comparison of various alternatives but also very stimulating and suggestive in the formulation of unconventional approaches to their particular problems.

Within the text of each numbered compound of this book, following the introductory section (if any) and the preparative section, is next set forth the significant aspects of its chemical behavior. The length of this part of the treatment varies widely from a few phrases to many pages. Very long treatments are appropriately subdivided for practical convenience, the particular sequence of arrangement being dictated by various circumstances. For example, the earlier subdivisions often deal with pyrolysis, reduction, oxidation, and substitution reactions, followed by the behavior with inorganic and organic reactants. With bifunctional compounds the initial group is frequently followed by the behavior of each function with inorganic and organic reactants in that order. Users will experience no difficulty in recognizing

the systematic organization of each compound. Emphasis has been placed upon a systematic and logical presentation of each case, and the above general outline has served the construction of this book only as a general guide rather than a rigid frame.

Two matters continually arising within the descriptive text deserve a further word of comment. The first relates to the fact that, in the course of reporting the chemical behavior of each numbered compound, there is necessarily involved reference to many other substances. Such of these as appear in either this volume (Order 3) or its predecessor (Order 1) are immediately followed by their serial numbers. A great many other compounds belonging to orders not yet written up in this series are inevitably involved; for such compounds reference to Beilstein is usually made for the convenience of the user who may have occasion to follow the matter further.

The second matter involves the practice of this book with respect to citations. Many instances appear which at first glance might appear to involve unnecessary repetition of the citation number, but which really comprise signals to the reader. As a simple illustration, consider the following extract from the text of *p*-chlorophenol, referring to the method of preparation of its *N*-(*m*-nitrophenyl)carbamate, viz.: "From $\bar{C}$ with *m*-nitrobenzazide (283) or *m*-nitrophenyl isocyanate (283) in lgr. (283)." This usage designates the fact that the preparation of both the *m*-nitrobenzazide and the *m*-nitrophenyl isocyanate is given in reference (283) together with their utilization as reagents in the conversion of *p*-chlorophenol to the corresponding *N*-(*m*-nitrophenyl)carbamate. Of course, with commonly available reagents such extra citations need not be included.

In view of the nature and magnitude of the text of this book, there may be a tendency to regard it as a specialized *Beilstein* within its field. Such a characterization would carry the implication that the text comprises all known chemical information with respect to each component compound, whereas only the more important representatives of such data are offered. In this connection one common misunderstanding with respect to Beilstein's *Handbuch* has significance. The Beilstein classification employs the principle of "latest position in the system." This means that, when a given fact could logically be placed in several different places, it is in general associated with the last of such places in the systematic plan. For example, as the methyl ether of phenol, anisole could conceivably be discussed either under methyl alcohol or under phenol. Following the above principle, however, Beilstein discusses it under phenol with no mention whatever under methyl alcohol. For Beilstein's purpose this principle is extremely well founded, results in an orderly, systematic, and uniform procedure, and, if properly understood, causes no trouble to the user. Its employment does have the unfortunate result, however, that for compounds occurring early in the

systematic sequence the impression is often given to the uninitiated that nothing is known about reactions involving components themselves listed later in the classification scheme. In contrast to the above Beilstein usage, the present *Tables* are unrestricted by any such arbitrary rule. Inasmuch as a large proportion of the compounds with which it deals are those which in the Beilstein classification appear to be inadequately described because of their earlier position in the sequence, users will quickly appreciate the added convenience of a generous treatment of the chemistry involved.

D. Preliminary tests

For certain of the more common compounds included in these *Tables*, there exist specific or semi-specific color tests. These are generally simple to execute, may often be applied satisfactorily to minute amounts of material, and, when positive, are so significant that their trial, if indicated, should invariably precede the derivatization of the sample. Such tests are indicated by the symbol Ⓟ but should be regarded as merely preliminary in character and not always carrying the same conviction as the derivatives.

E. Derivatives

The text section of each numbered compound is usually concluded by a group of derivatives. Those which for one reason or another have special importance are designated by the symbol Ⓓ placed at the left-hand side of the page. Interspersed with such cases will frequently be found others not bearing this symbol but instead merely designated by a dash. Relatives of the original parent compound so designated comprise materials, knowledge of whose existence (or less commonly nonexistence) or properties may be needed for comparison with related cases for the particular parent or other isomers thereof. Wherever possible, specific data on each relative included in this derivative section are given; in many cases, however, where careful systematic search has failed to uncover any published record of the compound, it is characterized in these tables as "unreported." All chemists recognize that reliable information that a particular compound has not yet been reported is more to be desired than its complete omission; and this feature of this volume will effect substantial economies of time for its users. Naturally, as time goes by the constant publication of new data will enable some of these informational gaps to be filled.

More than one value for the melting point of a particular product derived from a numbered parent or, conversely, several citations for the same value will often be noted through all parts of this book. These practices serve, respectively, to suggest caution because of lack of agreement and to attract attention to the concordance of results of several different workers.

The sequence in which these derivatives are listed has no relation to their

respective merits as means of identification of the particular parent. For each class of compounds, the particular sequence is arbitrary but standard in form and sequence in order to facilitate intercomparison and easy reference. For any particular class, however, the sequence is similar to that employed in Order 1 for the corresponding nonchlorinated parent.

F. Literature references

The fifth and final section of the descriptive material comprising each serially numbered compound comprises the corresponding references to the chemical literature. These are associated with the corresponding portions of the descriptive text by arbitrary numbers set in bold-face carets, e.g. **(5)**, the journal names being uniformly represented by the standard abbreviations employed by *Chemical Abstracts*. The single exception to the use of *Chemical Abstracts* abbreviations for literature references is that the German journal recently known as *Chemisches Zentralblatt* (but formerly as *Chemisches Centralblatt*) is here designated as *Cent.* This convention adequately suggests the name of the periodical in less space and improves the corresponding Beilstein abbreviation (C.) by avoiding confusion with Centigrade temperature.

The total number of such literature references in this book is very large, owing in part to the greatly increased scope of this Order 3 as compared with the restricted treatment of compounds of Order 1. It will be observed that, in addition to a much fuller record of the four fundamental physical constants, and a more generous regard for a diversified array of derivatives, this book (unlike its predecessor) deals extensively with the preparation and chemical behavior of its component species. Furthermore, whereas the earlier book arbitrarily excluded references to the patent literature, the present volume not only permits their inclusion but draws rather heavily upon it. The rapid growth of industrial organic chemistry, the fact that numerous chloro compounds of Order 3 represent individuals of great industrial significance, and the circumstances that for many such cases a large proportion of the available information is of such recent origin that little of it can be found in conventional monographs or other compendia have combined to necessitate considerable emphasis on the technical literature.

For a given individual numbered compound, a particular published article or patent is listed *only once*. The citation number representing the reference may be given many times in the descriptive text, but in the literature reference section the reference itself is not repeated. On the other hand, a given original article covering several individual compounds included in this book will be cited under each of the materials to which the article is relevant.

The order in which the literature references are arranged is determined by the sequence in which necessity for their mention arises in the text. This

results, of course, in what may appear to be a random sequence. The author is well aware that rearrangement of these references into a sequence comprising an alphabetical author index is possible. Such an operation, however, has been regarded as impracticable since it would multiply severalfold the opportunity for error and would be unlikely to confer advantages commensurate with the labor involved.

Literature references to journals considered to be generally accessible are given directly; but those to articles in journals with limited circulation or to articles in languages other than English, German, French, or Italian are usually accompanied by the location of the corresponding abstract in both the *Chemisches Centralblatt* and the *Chemical Abstracts*. This leads to the suggestion that users of this book, to whom a particular primary publication may be inaccessible, may themselves locate the corresponding abstracts by means of the usual Author Indexes to these works. Consultation of the abstract must never be regarded as equivalent to examination of the original publication but is generally better than no information at all.

Citations to original articles in scientific journals often refer to individual pages but sometimes also to a spread of pages, depending upon the nature of the article. The practice so frequently employed by others of citing an article merely by giving its initial page and leaving to the reader the often laborious job of locating the individual page germane to the aspect in question is deplored by the present author and has been avoided in this book. When a page spread (occasionally extending to the whole of a particular article) is cited, the reason is usually that the construction of the original paper is such that relevant material is scattered throughout the paper and individual page citation might be not only inadequate but even misleading. Since a given article appears (in general) but once in the group of literature references associated with each numbered compound, however, and since therefore the single number representing it may be used many times during the various aspects of the corresponding text, users finding that one of several individual pages so cited is inapplicable will recognize it is to be associated with some other aspect elsewhere in the text.

Attention is called to certain advantageous and unique practices followed by this book in connection with its citations of patents. The first element of patent citation is the name of the inventor (or of all, if more than one) if this information is known. The second element comprises the name of the company to which the patent has been assigned. All American patents are required by law to be issued to the inventors but are commonly assigned to the sponsor of the work. Foreign patents, however, do not always carry the names of individual inventors; in that event the company name has to serve both purposes. The third element is the nationality and number of the patent accompanied by its date of *issue* (not application). The fourth

element comprises reference to abstracts of the patent both in the *Chemisches Centralblatt* and in *Chemical Abstracts.* There are three reasons for this multiple form of abstract reference.

The first is that few chemists have immediate access to the corresponding original patents themselves and appreciate the convenience of the abstract. The second is the plain fact that the patent abstracts published by the *Chemisches Centralblatt* are usually so much more descriptive and more nearly complete than those of *Chemical Abstracts* that many chemists prefer to use the former. Doubters of this difference of quality between the two abstract journals are invited to convince themselves by direct comparison. Finally, the *Chemical Abstracts* reference is also included, however, because there may be some users of this book to whom the *Centralblatt* may not be available or who are timid about their ability to read even technical German. If in a particular case the patent has not been abstracted at all, this fact is also noted. Furthermore, because of the present inaccessibility of more recent issues of the *Centralblatt*, it has been necessary in some of the more recent references to cite only *Chemical Abstracts.*

In connection with the citation of patents, many instances will be noted in which the reference includes also the equivalent patents of other countries, each of these being accompanied by its dates, abstract references, etc., as for an individual patent.

The reader's attention is directed to the obvious fact that many patents are expressed in general terms so that, even though the protection sought may frequently cover one or more of the component compounds of this book, the specific individuals are not mentioned by name. No attempt has been made to interpret such general patents. For this reason systematic searchers will often consult higher or lower homologs of the compound comprising their initial interest.

6. Abbreviations

Necessity for economy of space has required in this book a continuation of the extensive set of abbreviations used with the earlier *Tables of Order* 1 together with certain additions required by new circumstances. All these abbreviations have been selected so as to suggest the full word, particularly when assisted by the context. No attempt has been made to enslave the text to the abbreviations, however, and the full word is sometimes employed even though a mnemonic for it is given in the *Table of Abbreviations.*

7. Indexes

This book contains five different types of indexes; three of these are distinctly novel and two are conventional, as explained below.

A. The empirical formula index

The index of empirical formulas lists each of the compounds in this book in the conventional familiar form under one or another of four parts according to whether the particular compound contains (1) only carbon and chlorine; (2) carbon, oxygen, and chlorine; (3) carbon, hydrogen, and chlorine; (4) carbon, hydrogen, oxygen, and chlorine. Within each of these parts the individual empirical formulas are arranged in groups according to increasing numbers of carbon atoms, and for a given number of carbon atoms according to increasing numbers of the other component atoms. Within each group of isomeric compounds the order of listing follows the sequence of the eight units comprising the Chemical Type Index (see below).

This empirical formula index contains also for each group of isomers both the molecular weight and the percentage chlorine content, each computed to one place of decimal units. This index not only serves as a convenient record of these constants but also suggests to the user isomers of the particular individual. The formula index may also be employed occasionally as a final verification of the presence or absence of a particular compound from the *Tables*, in possible instances where the names which occur to the worker do not appear in the alphabetical index.

A brief statistical analysis of this index may be of interest. The 1320 individual compounds comprising this book are distributed among 366 groups of isomers as follows:

		Groups of Isomers	Individuals
Part A	C/Cl compounds	11	11
Part B	C/O/Cl compounds	18	21
Part C	C/H/Cl compounds	135	566
Part D	C/H/O/Cl compounds	202	722
	Total	366	1320

The minimum number of isomers for a given empirical formula is obviously one; 28 of the above 366 groups represent such minimum cases. The maximum possible number of individual compounds within a particular empirical formula is, of course, indeterminately large; however, it is of interest to note that, of the 366 groups of isomers in this book, the largest number of individual compounds (21) occurs for the empirical formula $C_8H_7O_2Cl$. Other formulas with substantial numbers of individuals comprise $C_5H_9O_2Cl$ with 20, $C_7H_{15}Cl$ and $C_8H_{17}Cl$ each with 18, $C_5H_{10}Cl_2$ with 17, and $C_6H_{11}Cl$, $C_6H_{13}Cl$, and C_8H_9OCl each with 16, corresponding to a particular molecular weight.

B. Index of empirical formulas by percentage chlorine content

This index lists the 366 empirical formulas of the numbered compounds contained in this book in order of diminishing percentage of chlorine. This

type of index is unique; nothing of this sort exists in any other publication so far as is known. Many uses of such an index will suggest themselves, the most obvious example being to suggest various empirical formulas corresponding to a particular chlorine content.

Within this index will be observed many examples of identical chlorine contents for several different formulas; e.g., a percentage chlorine of 37.5 is common to the four different formulas $C_2H_3O_2Cl$, C_3H_7OCl, $C_8H_6OCl_2$, and $C_{14}H_9Cl_3$, despite the fact (as seen from the Empirical Formula Index) that the molecular weights of the last two are quite different from the others.

C. Index of empirical formulas by molecular weights

This index lists the 366 empirical formulas of the numbered compounds contained in this book in order of increasing magnitude of molecular weight. This index (like the preceding one) is unique, and nothing of the sort exists in any other publication so far as is known. Many uses of this index will suggest themselves, the most obvious example being to suggest various empirical formulas having the same molecular magnitude.

Within this index will also be observed many examples of identical molecular weights for several different formulas; e.g., the molecular weight of 136.6 is common to the three different formulas $C_5H_9O_2Cl$, $C_6H_{13}OCl$, and C_8H_5Cl.

D. Index of compounds according to chemical types

Since, as more fully explained earlier in this chapter, the component individuals of this book are not arranged in arbitrary genera and no standardized generic tests comparable to those of Order 1 have as yet been developed, the inclusion in this volume of an index in which the compounds are arranged according to the chemical classes to which they belong is of special value and utility.

In this chemical-type index, each compound is listed in at least one of eight chemical classes (units) as follows:

Unit 1. Chloro substitution products of saturated acyclic hydrocarbons.
Unit 2. Chloro substitution products of unsaturated acyclic hydrocarbons.
Unit 3. Chloro substitution products of cyclic hydrocarbons.
Unit 4. Chloro substitution products of hydroxy compounds (alcohols or phenols).
Unit 5. Chloro substitution products (and their relatives) of carbonyl compounds (aldehydes, ketones, quinones, aldehyde polymers, acetals, alcoholates, etc.).
Unit 6. Chloro substitution products of carboxylic acids and anhydrides.
Unit 7. Acyl chlorides.
Unit 8. Chlorine substitution products of ethers and of esters.

Compounds of the last five units containing more than one functional group are also listed under such of the others as may be appropriate. For example, 2,5-dichloro-3,6-dihydroxybenzoquinone-1,4 is listed both as a

carbonyl compound (Unit 6) and as a phenol (Unit 4); diethylene glycol mono(chloroacetate) is listed not only as an ester (Unit 8) but also as an alcohol (Unit 4) and an ether (Unit 8).

It may be of interest to summarize briefly the distribution of the compounds in this book among the several classes as shown in the following summary:

Unit 1	221	Unit 5	146
Unit 2	182	Unit 6	137
Unit 3	174	Unit 7	142
Unit 4	211	Unit 8	182

The total number of such unit listings (1395) thus exceeds the number of individual compounds (1320) by an amount representing the cases of multiple functions.

E. Alphabetical Index

This conventional type of index includes not only the " principal " name, but also all the subsidiary names given in the *Tables* for every numbered compound in this book. It cannot, of course, guarantee to contain every name which might conceivably be applied since, for the field of chemistry, such names are legion. However, with every name that is listed is associated the corresponding location (or serial) number, so that use of this index is perfectly straightforward and the index requires no cross referencing within itself. The first letter of the first syllable of the name proper establishes its position in the alphabetical sequence irrespective of any literal or numerical prefixes such as *o*-, *m*-, *p*-, *sec*-, *ter*-, *cis*-, *trans*-, α-, β-, γ-, δ-, *d*-, *l*-, *meso*-. Within a particular group of isomers with the same name, however, the sequence is *o*-, *m*-, *p*-; *sec*-, *ter*-; or α-, β, γ-, δ, etc. Iso is not construed as a prefix but as part of the main root. Further details of this sort are given in the introduction to the index itself.

CHAPTER II

DIVISION A. SOLIDS

(3:0000–3:0499)

— PENTACHLOROACETONE $Cl_2CH—\underset{\underset{O}{\|}}{C}—CCl_3$ C_3HOCl_5 Beil. I - 656 / I_1— / I_2—

M.P. $+2.1°$ **B.P.** 192°

See 3:6205. *Division B: Liquids, Section* 1, $D_4^{20} > 1.15$.

— 2,5-DICHLOROTOLUENE

$C_7H_6Cl_2$ Beil. V - 296 / V_1— / V_2-(231)

M.P. 5° **B.P.** 199° at 761 mm. $D_{20}^{20} = 1.2535$

See 3:6245 *Division B: Liquids, Section* 1, $D_4^{20} > 1.15$.

— *p*-CHLOROTOLUENE

C_7H_7Cl Beil. V - 292 / V_1-(150) / V_2-(226)

M.P. $+7.8°$ **B.P.** 162°

See 3:8287. *Division B: Liquids, Section* 2, $D_4^{20} < 1.15$.

— 1,1-DICHLORO-2-METHYLPROPANOL-2 (*unsym.*-Dichloro-*ter*-butyl alcohol; dichloromethyl-methyl-carbinol) $CH_3—\overset{\overset{CH_3}{|}}{\underset{\underset{OH}{|}}{C}}—CHCl_2$ $C_4H_8OCl_2$ Beil. I - 382 / I_1— / I_2—

M.P. $+8°$ **B.P.** 151° $D_4^{19} = 1.2363$ $n_D^{19} = 1.4598$

See 3:5772 *Division B: Liquids, Section* 1, $D_4^{20} > 1.15$.

— *o*-CHLOROPHENOL

C_6H_5OCl Beil. VI - 183 / VI_1-(98) / VI_2-(170)

M.P. 8.0° **B.P.** 175–176° $D_4^{25} = 1.2456$ $n_D^{25} = 1.5573$

See 3:5980. *Division B: Liquids, Section* 1, $D_4^{20} > 1.15$.

— DI-(β-CHLOROETHYL) CARBONATE $C_5H_8O_3Cl_2$ Beil. III — / III_1— / III_2-(5)

$(ClCH_2CH_2O)_2C=O$

M.P. 8.5° **B.P.** 240–241° $D_4^{20} = 1.3506$ $n_D^{20} = 1.4610$

See 3:6790. *Division B: Liquids, Section* 1, $D_4^{20} > 1.15$.

3:0010 CINNAMYL CHLORIDE (3-Chloro-1-phenylpropene-1)

C_9H_9Cl Beil. V - 482, V_1-(232), V_2-(372)

M.P.	B.P.				
8–9° (1)	140°	at 37 mm., sl. dec. (5)		$D^{25}_{-} = 1.08815$ (9)	$n^{25}_{D} = 1.58065$ (9)
8° (2)	125–126°	at 22 mm.	(6)	$D^{15}_{4} = 1.101$ (6)	$n^{12}_{D} = 1.587$ (8)
7–8° (3)	120°	at 18 mm.	(6)	$D^{12}_{4} = 1.090$ (8)	
4–9° (4)	117–119°	at 17 mm.	(7)		
	118°	at 15 mm.	(8)		
	115°	at 13 mm., sl. dec.	(5)		
	119.5–120.5°	at 12 mm.	(9)		
	116–117°	at 12 mm.	(1)		
	108°	at 12 mm.	(10)		
	106°	at 10 mm.	(11)		
	109–110°	at 6 mm.	(3)		
	102–103°	at 5 mm.	(3)		
	101.5–103.4°	at 5 mm.	(12)		
	94°	at 5 mm.	(13)		
	86–87°	at 2 mm.	(3)		

Care should be taken to avoid confusion of C̄ with the acid chloride of cinnamic acid; the acid chloride is properly designated as cinnamoyl chloride (3:0330); furthermore note that some of the older publications designate C̄ as "styryl chloride," which is now incorrect since in current usage the name *styryl* is reserved for the radical $C_6H_5.CH{=}CH$— derived from styrene (14).

Attention is also drawn to the fact (not fully recognized in the older work) that in some (but not all) reactions of C̄ the prods. obtained may in part be derived from the synionic mesomer of C̄, viz., phenyl-vinyl-carbinyl chloride (3-chloro-3-phenylpropene-1); for examples see below.

C̄ when pure is colorless oil with no odor of HCl; if HCl is present C̄ soon darkens on stdg. — C̄ should leave no residue on distillation, and best yields of RMgCl (see below) are obtainable only with freshly distilled C̄ (3).

[For prepn. of C̄ from cinnamyl alc. (1:5920) with HCl gas at 0° (yields: 92–93% (1), 78% (7), 60% (12)) (5) (6) (15), with HCl gas in CCl_4 soln. at room temp. (85% yield (7)), with 6–7 wt. pts. 6 *N* HCl on distn. (79% yield (4)), or with conc. HCl + $ZnCl_2$ in C_6H_6 (54% yield (16) see indic. refs.; from cinnamyl alc. (1:5920) with PCl_3 in C_6H_6 (62.5% yield (1)), or PCl_3 + $ZnCl_2$ in C_6H_6 (65% (16)) (note that PCl_5 + $ZnCl_2$ in C_6H_6 gave only tar (16)); from cinnamyl alc. (1:5920) with $SOCl_2$ + pyridine in $CHCl_3$ (yields: 83% (3), 69–75% (12)), with $SOCl_2$ + diethylaniline (18) or other tertiary bases (18), or with excess $SOCl_2$ in C_6H_6 (72% yield (16)) see indic. refs.; from cinnamyl ethers by cleavage with HCl (22° Bé) on htg. under press. see (8); from cinnamyl acetate (see below) by passing in dry HCl see (18).]

[For prepn. of C̄ from phenyl-vinyl-carbinol [Beil. VI-572, VI_1-(283)] (7) with HCl gas (7) (10) or with *p*-nitrobenzoyl chloride in ether on htg. in s.t. (10); from phenyl-vinyl-carbinyl acetate with HCl gas see (19).]

C̄ with Br_2 (1 mole) adds 2 atoms halogen yielding (20) (6) (10) α,β-dibromo-γ-chloro-*n*-propylbenzene, tbls. from ether, m.p. 104–105° (6) (10).

C̄ with conc. HI ($D = 1.7$) (3 wt. pts.) in AcOH (7) or C̄ with KI in dry acetone (11) gives in good yield (7) cinnamyl iodide, pale yel. lfts., which after very careful recrystn. from AcOH have m.p. 57° (7); note, however, that the substance is very unstable, cf. (7) (11).

[$\bar{C}$ on htg. with salts of acids yields a mixt. of the corresp. esters of cinnamyl alcohol (1:5920) and phenyl-vinyl-carbinol, the proportions of which vary with the nature of the acid radical, the metal, solvent, etc.; for extensive study of the reaction see (19) (7).] — [For behavior of $\bar{C}$ with ethyl sodioacetoacetate (21), Ag salt of 3-hydroxynaphthoquinone-1,4 (2), or with 1,5-dichloroanthrone + aq. KOH (22) see indic. refs.]

$\bar{C}$ readily hydrolyzes to the corresp. alc. (1:5920): e.g., $\bar{C}$ with aq. on boilg. for 1 hr. is 75% saponified (7); $\bar{C}$ with boilg aq. 1 *N* NaOH is 95% hydrolyzed in 1 hr. (7); note, however, that $\bar{C}$ is remarkably stable toward strong aq. alk. in cold (e g., with 3.5 vols. 53% aq. NaOH only trace of hydrolysis even after 8 hrs. shaking (7)); note also that the cinnamyl alc. (1:5920) obtd. by hydrol. is contaminated with di-cinnamyl ether, b.p. 231–232°, and probably also by the ether from phenyl-vinyl-carbinol. — $\bar{C}$ (10 g.) with excess cold dil. aq. Na_2CO_3 on shaking 85 hrs. gives phenyl-vinyl-carbinol (1.3 g.) + cinnamyl alc. (1:5920) (0.7 g.), di-cinnamyl ether (2 6 g.) + unhydrolyzed chlorides (4.1 g.) (7).

[$\bar{C}$ with *abs.* alc. KOH yields only (7) cinnamyl ethyl ether; note, however, that the course of the reaction is modified by pres. of aq. and that $\bar{C}$ with NaOH in 70% aq. alc. the cinnamyl ethyl ether is accompanied by 25–30% of ethyl phenyl-vinyl-carbinyl ether (7); furthermore $\bar{C}$ with silver oxide in *abs.* alc. (thus even in absence of aq.) gives *both* ethers (7) (for numerous details see (7)).]

[The behavior of $\bar{C}$ with NH_3 (or amines) is doubtless similarly influenced by the environment but has been less thoroughly studied. — $\bar{C}$ in ether with large excess conc. aq. NH_4OK on stdg. gives (77% yield (23)) tetracinnamylammonium chloride, ndls. from alc., m.p. 199° (23); $\bar{C}$ with abs. alc. NH_3 gives (24) (25) (5) mono-, di- and tri-cinnamylamines.]

$\bar{C}$ with tertiary amines forms quaternary salts. e g., $\bar{C}$ with Me_3N in abs. EtOH 24 hrs. at room temp. gives (26) (25) cinnamyl-trimethyl-ammonium chloride, very hygroscopic solid (for derivatives see (25) (26)); for quaternary salt formn. of $\bar{C}$ with dimethylaniline (15) or pyridine (6) (5) see indic. refs.

[$\bar{C}$ (1 mole) with aniline (4 moles) in ether as directed gives (50% yield (27)) *N*-(cinnamyl)-aniline, m.p. 21°, b.p. 200–202° at 12 mm., 178° at 3 mm. (27); $\bar{C}$ (1 mole) with hexamethylenetetramine (1 mole) in aq. alc. as directed gives (20–30% yield (8)) cinnamaldehyde (1:0245).]

$\bar{C}$ (freshly distilled) with Mg in dry ether under special conditions gives (83% yield (3)) (12) RMgCl: note carefully, however, that this Grignard is (or behaves as) a mixture consisting of 27% cinnamyl MgCl, C_6H_5—CH=CH.CH_2MgCl, accompanied by 73% phenyl-vinyl-carbinyl MgCl, C_6H_5—C(MgCl).CH=CH_2 (12).

[The reactns. of the Grignard mixture thus obtd. from $\bar{C}$ therefore generally yield prods. corresponding to both the components sometimes accompanied by material originating from coupling reactns. of RMgCl (either or both types) with itself: e.g., RMgCl (designating the above mixture) on acid hydrolysis with 3 *N* H_2SO_4 gives not only both propenylbenzene [Beil. V-481, V_1-(231), V_2-(371)], b.p. 176°, and allylbenzene [Beil. V-484, V_1-(233), V_2-(373)], b.p. 156° (from the two RMgCl types) (combined yield 47% (12)), but also a high-boilg. residue (81% yield (12)) (from coupling of RMgCl, see below).]

[$\bar{C}$ (2 moles) with Mg (1 atom wt.) in dry ether subsequently hydrolyzed gives a high-boilg. fractn. consisting of a solid and a liquid hydrocarbon: the solid hydrocarbon (8–9% yield (28)) (1) is 1,6-diphenylhexadiene-1,5 (dicinnamyl) [Beil. V_1-(338), V_2-(597)], lfts. from alc. or AcOH, m.p. 82° (1), 81–82° (29), b.p. 211° at 11 mm. (1), 180° at 5 mm. (29); the liquid hydrocarbon (42.9% yield (28)) has now been recognized (28) (contrary to earlier views (1)) as 1,4-diphenylhexadiene-1,5, b.p. 157–160° at 2 mm., $D_{20}^{20} = 0.9919$, $n_D^{20} =$ 1.5890 (28). — For mode of formation of these prods. see (28).]

[$\bar{C}$ converted to RMgCl (see above) and reacted with NH_2Cl at −20° gives (14% yield (33)) cinnamylamine.]

Ⓓ Phenyl-vinyl-acetic acid: cryst. from pet. ether at −10°, m.p. 23–24° (30). [From RMgCl with CO_2 (note that ord. method gives low yields (38% (3) cf. (17)) but simple modification of carbonation technique raises yield to 62–66% (3)).] — This acid on htg. or on warming with either alk. or acid isomerizes (by change in position of double bond) to α-phenylcrotonic acid (methylatropic acid) [Beil. IX-615)] (see also next paragraph).

—— α-Phenylcrotonic acid (methylatropic acid): pr. from alc., ndls. or lfts. from aq., m.p. *135–136° (17) (p-nitrobenzyl ester, m.p. 80–81° (31))* (see also preceding paragraph). [From RMgCl (above) with ethyl chloroformate (3:7295) followed by hydrolysis of the intermediate ethyl phenyl-vinyl-acetate by htg. with 20% HCl or by shaking for 2 days with alkali (the hydrolysis being accompanied by simultaneous rearr. of the unsatd. linkage) (30).]

Ⓓ *Phenyl-vinyl-acetic anilide: cryst. from C_6H_6, alc., or $CHCl_3$, m.p. 97–98° (30).* [From RMgCl (above) with phenyl isocyanate in dry ether (30); this prod. may be accompanied by a small amt. of α-phenylcrotonanilide, m.p. 192°, from partial isomerization during the reactn. (30).]

Ⓓ *N*-(Cinnamyl)phthalimide: cryst. from 90% alc. or 90% AcOH (24) or from *n*-PrOH *(32), m.p. 156° (32), 153° (24). [From C̄ with K phthalimide by htg. at 160° for* several hrs. (24); note that the structure of this prod. has been confirmed as the cinnamyl (and not the phenyl-vinyl-carbinyl) type (32).]

3:0014 10-CHLORODECANOL-1 (ω-Chloro-*n*-decyl alcohol) $CH_2.(CH_2)_8.CH_2OH$ (with Cl on the first CH_2) $C_{10}H_{21}OCl$ Beil. I - 426, I_1-(213), I_2—

M.P.	B.P.		
10–11° (1)	161–165° at 20 mm. (2) 147.5–149° at 9 mm. (3)	$D_4^{25} = 0.9630$ (1)	$n_D^{23} = 1.45796$ (1)

Cryst. from pet. eth. (1). — Almost insol. aq.; eas. sol. alc., ether, C_6H_6, pet. ether.

[For prepn. of C̄ from α,ω-decamethylene glycol [Beil. I-491, I_1-(250), I_2-(560)] (m.p. 74.5° (1)) with conc. HCl (10 vols.) on boilg. 4 hrs. (2) (3) (for improvements of this method see (1)) (yields: 65% (4), 50% (2)) see indic. refs.]

[C̄ on distn. with fused NaOH loses HCl giving two products regarded (2) as decamethylene oxide and decen-1-ol, but their structures have been questioned (3).]

C̄ with thiophenol in aq. NaOH, heated 3 hrs., yields (1) 10-hydroxy-*n*-decyl phenyl sulfide, ndls. from lt. pet., m.p. 66.5° (1); this prod. with $SOCl_2$ gives 10-chloro-*n*-decyl phenyl sulfide, cryst. from alc., m.p. 27.5° (1).

C̄ with morpholine gives (5) alm. quant. 10-(4-morpholinyl)decanol-1, m.p. 39.5–40.5°, b.p. 164.0–165.0° at 2 mm. (corresp. *N*-(α-naphthyl)carbamate, m.p. 66.5–67.5° cor. (5)). — C̄ (1 mole) with *N*-phenylpiperazine (2 moles) at 100° for 5 hrs. gives (5) in alm. 100%

formn. of $\bar{C}$ *from cetyl alc.* + PCl_5 *(in pres. of mesityl oxide* + Ac_2O*) (61.5% yield)* see (10). — For formn. of $\bar{C}$ from cetyl alc. with PCl_3 see (5), but note that prod. always conts. unchanged cetyl alc. (1:5945) and cetene-1 (1:7000) (12) cf. (2).]

[For prepn. of $\bar{C}$ from cetyl stearate (1:2193) with dry HCl gas (97% yield (11)), from cetyl acetate (1:2038) with dry HCl gas + $ZnCl_2$ at 180° (13) see indic. refs.]

[For formn. of $\bar{C}$ from a mixt. of K palmitate + K chloroacetate by electrolysis see (8).]

PHYSICAL BEHAVIOR OF $\bar{C}$

[For study of electrophoretic mobility of emulsions of $\bar{C}$ see (14).]

CHEMICAL BEHAVIOR OF $\bar{C}$

With Inorganic Reactants

With metals. [$\bar{C}$ with Li in dry ether under N_2 gives (100% yield (15)) $C_{16}H_{33}Li$; on carbonation of mixt. with CO_2 this is converted (51% yield (15)) to *n*-heptadecanoic acid (margaric acid) (1:0635): note, however, that $\bar{C}$ with Li in pet. eth. (b.p. 30–35°) gives (15) only 63% yield $C_{16}H_{33}Li$ and this on carbonation only 27% overall yield of margaric acid accompanied by other prods. — For analogous reacts. of $\bar{C}$ with Na see (15) (16); for react. of $\bar{C}$ with Ca in dry ether under N_2 see (15).]

$\bar{C}$ with Mg in dry ether + trace I_2 gives in 6 hrs. (96% yield (1)) $C_{16}H_{33}MgCl$.

With NH_3. [$\bar{C}$ with liq. NH_3 in alc. in s.t. at 170° for 24 hrs. gives (70% yield (17)) di-*n*-hexadecylamine, cryst. from alc., m.p. 65°, b.p. 220° at 3 mm. (17), accompanied by (24% yield (17)) *n*-hexadecylamine, m.p. 45°, b.p. 146–148° at 3 mm. ($\bar{B}$.HCl, lfts. from abs. alc., m.p. 178° (17)).]

With misc. inorg. reactants. [$\bar{C}$ over spec. prepd. Al_2O_3 at 250° loses HCl giving (94% yield (18)) of a mixt. of hexadecenes together with other prods.]

[$\bar{C}$ with KOH at 200–300° gives (19) palmitic acid (1:0650); $\bar{C}$ with alc. KSH gives (21) *n*-hexadecyl mercaptan; $\bar{C}$ with alc. K_2S gives (21) di-*n*-hexadecyl sulfide.]

[$\bar{C}$ with $Na_2SO_3.7H_2O$ (6 moles) at 190–200° for 8 hrs. under press. gives (98% yield (20)) sodium cetanesulfonate-1.]

[For study of rate of reactn. of $\bar{C}$ with KI in acetone at 50° and 60° see (3).]

With Organic Reactants

[$\bar{C}$ with alc. KOH gives (5) ethyl *n*-hexadecyl ether, f.p. 19.9° (5); $\bar{C}$ with sodium allyl oxide refluxed 30 hrs. gives (70% yield (22)) allyl *n*-hexadecyl ether, pl. from aq. alc., m.p. 25° (22).]

[$\bar{C}$ (1 mole) with 33% alc. $MeNH_2$ (1 mole) in s.t. at 140–150° for 18 hrs. gives (68% yield (17)) *N*-methyl-di-*n*-hexadecylamine, ndls. from alc., m.p. 36–37°, b.p. 269–271° at 1 mm. (17) accompanied by (15% yield (17)) *N*-methyl-*n*-hexadecylamine, b.p. 147–150° at 1 mm. ($\bar{B}$.HCl, m.p. 169–170° (17)). — $\bar{C}$ (1 mole) with Me_2NH (2 moles) in alc. in s.t. at 140° for 14 hrs. gives (82.5% yield (17)) *N*,*N*-dimethyl-*n*-hexadecylamine, b.p. 158° at 3 mm. ($\bar{B}$.HCl, lfts. from AcOEt/dioxane 5/1, m.p. 198° (17)).]

$\bar{C}$ with tertiary amines gives by addn. the corresp. quaternary ammonium salts [e.g., $\bar{C}$ with Me_3N (2 moles) in alc. in s.t. at 100–105° for 12–16 hrs. (17), or $\bar{C}$ with Me_3N (1 mole) in closed bottle at 110° for 5 hrs. (7), gives (100% yield (17)) trimethyl-*n*-hexadecyl-ammonium chloride, hygroscopic lfts. from AcOEt/alc., m.p. abt. 70° (17); for study of surface tension of aq. solns. of this salt see (7)].

$\bar{C}$ with pyridine (1 mole) in s.t. at 110° for 15 hrs. (23) or at 120° for 8 hrs. (7) gives *n*-hexadecyl-pyridinium chloride, cryst. with 1 H_2O from alc./ether or C_6H_6, m.p. 83° (23), 82° (24) [for study of surface tension (7), conductivity (24), and elec. potential (24) of aq.

solns. of this salt see indic. refs.; for cat. hydrogenation of this salt to *N*-(*n*-hexadecyl) piperidine.HCl, m.p. 180° see (23); for study of favorable effect of press. on reactn. of $\bar{C}$ with pyridine see (12)].

[For analogous reactn. of $\bar{C}$ with *N,N*-dimethyl-benzylamine (17) or with isoquinoline (23) see indic. refs.]

[For reactn. of $\bar{C}$ with α-picoline + $NaNH_2$ yielding α-(*n*-heptadecyl)pyridine, m.p 23.5°, b.p. 206° at 2.5 mm., $\bar{B}$.PkOH, m.p. 87°, or of $\bar{C}$ with γ-picoline + $NaNH_2$ yielding γ-(*n*-heptadecyl)pyridine, m.p. 33°, b.p. 207–210° at 2.5 mm., $\bar{B}$.PkOH, m.p. 115°, see (9)]

—— *n*-**Hexadecyl *p*-nitrobenzoate**: m.p 58 4° cor. (25). [Prepd. indirectly.]

—— *n*-**Hexadecyl 3,5-dinitrobenzoate**: m.p 66°. [Prepd. indirectly.]

—— *N*-(*n*-**Hexadecyl)phthalimide**: unreported.

—— *S*-(*n*-**Hexadecyl)isothiourea hydrochloride**: m p. 126–128° (26). [From $\bar{C}$ with thiourea in alc. on refluxing 3–4 days (26)]

—— *n*-**Hexadecyl mercuric chloride**: cryst. from pet. eth. or AcOEt, m.p. 114–115° (15). [Prepd. indirectly; note that m p. of mixts. of this prod. with either n-$C_{12}H_{25}HgCl$ (m p. 114–114.5°) or $C_{18}H_{37}HgCl$ (m.p 115–116°) is depressed (15).]

formn. of C̄ from cetyl alc. + PCl_5 (in pres. of mesityl oxide + Ac_2O) (61.5% yield) see (10). — For formn. of C̄ from cetyl alc. with PCl_3 see (5), but note that prod. always conts. unchanged cetyl alc. (1:5945) and cetene-1 (1:7000) (12) cf. (2).]

[For prepn. of C̄ from cetyl stearate (1:2193) with dry HCl gas (97% yield (11)), from cetyl acetate (1:2038) with dry HCl gas + $ZnCl_2$ at 180° (13) see indic. refs.]

[For formn. of C̄ from a mixt. of K palmitate + K chloroacetate by electrolysis see (8).]

PHYSICAL BEHAVIOR OF C̄

[For study of electrophoretic mobility of emulsions of C̄ see (14).]

CHEMICAL BEHAVIOR OF C̄

With Inorganic Reactants

With metals. [C̄ with Li in dry ether under N_2 gives (100% yield (15)) $C_{16}H_{33}Li$; on carbonation of mixt. with CO_2 this is converted (51% yield (15)) to *n*-heptadecanoic acid (margaric acid) (1:0635): note, however, that C̄ with Li in pet. eth. (b.p. 30–35°) gives (15) only 63% yield $C_{16}H_{33}Li$ and this on carbonation only 27% overall yield of margaric acid accompanied by other prods. — For analogous reacts. of C̄ with Na see (15) (16); for react. of C̄ with Ca in dry ether under N_2 see (15).]

C̄ with Mg in dry ether + trace I_2 gives in 6 hrs. (96% yield (1)) $C_{16}H_{33}MgCl$.

With NH_3. [C̄ with liq. NH_3 in alc. in s.t. at 170° for 24 hrs. gives (70% yield (17)) di-*n*-hexadecylamine, cryst. from alc., m.p. 65°, b.p. 220° at 3 mm. (17), accompanied by (24% yield (17))*n*-hexadecylamine, m.p. 45°, b.p. 146–148° at 3 mm. (B̄.HCl, lfts. from abs. alc., m.p. 178° (17)).]

With misc. inorg. reactants. [C̄ over spec. prepd. Al_2O_3 at 250° loses HCl giving (94% yield (18)) of a mixt. of hexadecenes together with other prods.]

KSH gives (21)

(98% yield (20))

sodium cetanesulfonate-1.]

[For study of rate of reactn. of C̄ with KI in acetone at 50° and 60° see (3).]

With Organic Reactants

[C̄ with alc. KOH gives (5) ethyl *n*-hexadecyl ether, f.p. 19.9° (5); C̄ with sodium allyl oxide refluxed 30 hrs. gives (70% yield (22)) allyl *n*-hexadecyl ether, pl. from aq. alc., m.p. 25° (22).]

[C̄ (1 mole) with 33% alc. $MeNH_2$ (1 mole) in s.t. at 140–150° for 18 hrs. gives (68% yield (17)) *N*-methyl-di-*n*-hexadecylamine, ndls. from alc., m.p. 36–37°, b.p. 269–271° at 1 mm. (17) accompanied by (15% yield (17)) *N*-methyl-*n*-hexadecylamine, b.p. 147–150° at 1 mm. (B̄.HCl, m.p. 169–170° (17)). — C̄ (1 mole) with Me_2NH (2 moles) in alc. in s.t. at 140° for 14 hrs. gives (82.5% yield (17)) *N*,*N*-dimethyl-*n*-hexadecylamine, b.p. 158° at 3 mm. (B̄.HCl, lfts. from AcOEt/dioxane 5/1, m.p. 198° (17)).]

C̄ with tertiary amines gives by addn. the corresp. quaternary ammonium salts [e.g., C̄ with Me_3N (2 moles) in alc. in s.t. at 100–105° for 12–16 hrs. (17), or C̄ with Me_3N (1 mole) in closed bottle at 110° for 5 hrs. (7), gives (100% yield (17)) trimethyl-*n*-hexadecyl-ammonium chloride, hygroscopic lfts. from AcOEt/alc., m.p. abt. 70° (17); for study of surface tension of aq. solns. of this salt see (7)].

C̄ with pyridine (1 mole) in s.t. at 110° for 15 hrs. (23) or at 120° for 8 hrs. (7) gives *n*-hexadecyl-pyridinium chloride, cryst. with 1 H_2O from alc./ether or C_6H_6, m.p. 83° (23), 82° (24) [for study of surface tension (7), conductivity (24), and elec. potential (24) of aq.

solns. of this salt see indic. refs.; for cat. hydrogenation of this salt to N-(n-hexadecyl) piperidine.HCl, m.p. 180° see (23); for study of favorable effect of press. on reactn. of $\bar{C}$ with pyridine see (12)].

[For analogous reactn of $\bar{C}$ with N,N-dimethyl-benzylamine (17) or with isoquinoline (23) see indic. refs.]

[For reactn. of $\bar{C}$ with α-picoline + $NaNH_2$ yielding α-(n-heptadecyl)pyridine, m.p 23.5°, b.p. 206° at 2.5 mm , $\bar{B}$.PkOH, m.p. 87°, or of $\bar{C}$ with γ-picoline + $NaNH_2$ yielding γ-(n-heptadecyl)pyridine, m.p. 33°, b.p. 207–210° at 2.5 mm., $\bar{B}$.PkOH, m.p. 115°, see (9).]

—— *n*-**Hexadecyl *p*-nitrobenzoate:** m p. 58.4° cor. (25) [Prepd. indirectly.]

C̄ rapidly becomes turbid in contact with atmosphere and should be kept in sealed tubes (1). — C̄ on attempted distn. at ord. press. loses HCl and gives 1,1,2,2-tetraphenylethane [Beil. V-739, V_1-(371)] (20), m.p. 211°, and 1,1,2,2-tetraphenylethylene [Beil V-743, V_1-(376)] (9), m.p. 227°.

[For prepn. of C̄ from diphenylcarbinol (1:5960) with dry HCl gas alone (9) (21), or in C_6H_6 (92% yield (14)), or in C_6H_6 + $CaCl_2$ (yield: 90% (1), 85% (3)) (11) (17), with $SOCl_2$ in toluene (93.3% yield (2)), with PCl_5 in $POCl_3$ (92% yield (14)), or with $BeCl_2$ (77% yield (8)) see indic. refs.; from diphenylmethane (1:7120) with PCl_5 at 170° (together with other products) (22) or with NOCl (together with other products) (23) see indic. refs.: for formn. of C̄ from diphenylcarbinyl MgBr with ClCN (42% yield + 8% diphenylacetonitrile + 5% 1,1,2,2-tetraphenylethane) see (10); from *bis*-(diphenylcarbinyl) ether in C_6H_6 with HCl gas (77% yield) see (1); from diphenylcarbinylhydrazine with boilg. dil. HCl see (24); from diphenyldiazomethane with HCl gas in ether at −80° see (25).]

[C̄ with molecular Ag in C_6H_6 *in absence of* O_2 gives 100% yield (19) of 1,1,2,2-tetraphenylethane (see first paragraph); in pres. of pure O_2 yield drops to 2–8% and other products are formed (19); C̄ in C_6H_6 refluxed some hours with Na gives (80–90% yield (14)) (9) (21) 1,1,2,2-tetraphenylethane (see first paragraph); C̄ with Na in liq. NH_3 gives (26) 1,1,2,2-tetraphenylethane (65% yield) + diphenylmethane (1:7120) (27% yield).]

C̄ in dry ether treated with Mg + trace of I_2 immediately ppts. 1,1,2,2-tetraphenylethane whose yield may reach 95.5% (2); however, under special conditions (6) C̄ in ether with Mg + trace of I_2 gives (51–71%) corresp. RMgCl cpd.; this prod. upon treatment with CO_2 gives (yield: 84% (6), 32.5% (2)) diphenylacetic acid (1:0765), m.p. 148°; the RMgCl cpd. does *not* react (2), however, with phenyl isocyanate.

[C̄ with pure $AlCl_3$ immediately resinifies (11); however, C̄ in C_6H_6 with $AlCl_3$ gives (11) triphenyl-chloromethane (3:3410) + diphenylmethane (1:7120) with a very little triphenylmethane (1:7220).]

[C̄ htd. with 20% aq. Na_2SO_3 soln. for 3 hrs. at 120° gives (100% yield (28)) (27) *bis*-(diphenylmethyl) ether [Beil. VI-679, VI_1-(326)], cryst. from alc., m.p. 109° (27), 110° (17); note that this reaction probably results from intermediate diphenylcarbinol and that none of the expected sulfonate can be isolated.]

[For reactn. of C̄ with phenols + $ZnCl_2$ yielding mono-, di- or tri-alkylated phenols according to conditions see (13) (29) cf. (30); for reactn. of C̄ with thiophenols see (31); for reactn. of C̄ with excess Br.Mg.C≡C.MgBr giving (40–50% yield) 1,1,4,4-tetraphenylbutine see (32); for reactn. of C̄ with anthrone + KOH see (33).]

C̄ with aq. hydrolyzes yielding diphenylcarbinol (1:5960) or its reactn. products according to particular conditions; for extensive studies see (34) (12) (35) (18) (40) (35). — C̄ with EtOH undergoes alcoholysis yielding ethyl diphenylcarbinyl ether + HCl (for very extensive studies of this and related reactions see (1) (36) (4) (17) (37) (7) (35). — C̄ after warming with alc. may then be titrated quant. with stand. alkali using phenolphthalein (1).

—— Diphenylcarbinyl acetate [Beil. VI-680, VI_1-(326)]: cryst. from AcOH, m.p. 40–41°. [From C̄ with KOAc in AcOH (22).]

[*See also cis-2-chlorocyclohexanol*-1 (3:9374).]

Both the two theoretically possible geometrical stereoisomers of 2-chlorocyclohexanol-1 are known. The single form obtained from cyclohexene (tetrahydrobenzene) by addn. of HOCl or from cyclohexene oxide by addn. of HCl is now regarded (3) as the *trans* isomer C̄. The *cis* form (3:9374) is obtd. by other methods.

Colorless pr. from mixt. of C_6H_6 + lgr. at low temp.; C̄ has characteristic odor, is vol. with steam.

[For prepn. of C̄ from cyclohexene (tetrahydrobenzene) (1·8070) with HOCl (yields: 70–73% (4), 70% (5)) (6) (7) (8) or with *N*-chlorourea (yield: 74% (26), 54% (9)) see indic. refs.; from cyclohexene oxide (see below) with conc. HCl or with $ZnCl_2$ in dry ether see (3); for probable formn. of C̄ from cyclohexene (1:8070) with EtOCl (3:7022) see (10); for formn. of a mixt. of both stereoisomeric 2-chlorocyclohexanols contg. 27–28% C̄ + 72–73% *cis*-isomer from 2-chlorocyclohexanone (3:0120) by reductn. with isopropyl MgCl, *ter*-butyl MgX, or cyclohexyl MgX see (3); for formn. of a mixt. (b.p. 78–80° at 12 mm.) of both isomers by hydrolysis of 2-chlorocyclohexanyl acetate see (11).]

C̄ with aq. NaOH at room temp. gives (yields. 70–73% (12), 70–75% (5), 80% (9), 55% (13)) cyclohexene oxide (1,2-epoxycyclohexane) [Beil. XVII-21], b.p. 131.5° at 760 mm. [Note that reactn. of C̄ with alk. is 300 times as fast as that of the *cis* isomer (3:9374) (use in detn. of proportion of C̄ in mixts. of isomers), that the latter with alk. gives no epoxy cpd. but instead cyclohexanone, and finally that C̄ can be separated from its isomer by conversion to cyclohexene oxide from which the remaining *cis* isomer can be sepd. by distn. (3).]

C̄ with alk. or with alc. KCl is *not* converted to *cis* isomer (3) but C̄ on protracted htg. with HCl rearr. to a small extent to the *cis* isomer.

[For use of C̄ as seed disinfectant see (15).]

The halogen atom of C̄ is fairly reactive, but its replacement often involves rearr. of the cyclohexyl ring to a cyclopentyl ring.

[C̄ on boilg. with dil. alc. slowly gives (1) *trans*-cyclohexanediol-1,2 [Beil. VI-740] with cyclopentylformaldehyde (formylcyclopentane), the latter increasing in pres. of dil. H_2SO_4 or of $CaCl_2$ (1).]

[C̄ with NaOMe in MeOH yields (14) *cis*-2-methoxycyclohexanol-1 [Beil. VI-740], b.p. 181.5° at 760 mm., $D^{20}_{-} = 1.015$, $n^{20}_D = 1.4605$ (14); C̄ with NaOEt in EtOH (14) (or C̄ in EtOH treated with Na in attempted reductn. (16) gives (87% yield (16)) *cis*-2-ethoxycyclohexanol-1 [Beil. VI-740], b.p. 187° at 760 mm., $D^{20}_{-} = 0.982$, $n^{20}_D = 1.4563$ (14); C̄ with sodium *n*-propylate yields (14) 2-*n*-propoxycyclohexanol, b.p. 205° at 760 mm., $D^{20}_{-} = 0.970$, $n^{20}_D = 1.4580$ (14); C̄ with sodium cyclohexanolate yields (14) 2-cyclohexanoxycyclohexanol, m.p. 50° (14).]

[C̄ with $C_6H_5.CH_2MgCl$ gives (54% yield (17)) benzyl-cyclopentyl-carbinol, b.p. 166–169° at 20 mm., m.p. 30° (3,5-dinitrobenzoate, m.p. 100.5–101.5° (17)). — C̄ with excess MeMgI gives (50% yield (13)) mixt. of both *cis* and *trans* 2-methylcyclohexanols (1:6420). — C̄ with cyclohexyl MgCl (cf. 3:8040) yields (18) cyclohexyl-cyclopentyl-carbinol, m.p.

34° (*p*-nitrobenzoate, m.p. 49–50°, 3,5-dinitrobenzoate, m.p. 102°, acid phthalate, m.p. 92–93°, *N*-phenylcarbamate, m.p. 122° (18)).]

[$\bar{C}$ with conc. aq. NH_4OH shaken for 24 hrs. (19) or $\bar{C}$ with NH_3 in alc. htd. in s.t. for 1 hr. (6) gives (yields: 71% (19), 61% (6)) *cis*-2-aminocyclohexanol [Beil. XIII-348], m.p. 65° (19) (6), b.p. 110° at 24 mm. (19). — $\bar{C}$ with diethylamine (2 moles) htd. in s.t. at 150° for several hrs. (20) (or similarly with BuOH as solvent (21)) yields 2-(diethylamino)-cyclohexanol, b.p. 225° at 740 mm. (21), 224° at 730 mm. (20), D^{25}_{25} = 0.9280 (21), n^{24}_{D} = 1.4659 (21) (hydrochloride, m.p. 170.5–171.5° (21)). — $\bar{C}$ with 5 pts. piperazine hydrate htd. 3 hrs. at 140° gives (22) both *N,N'-bis*-(2-hydroxycyclohexyl)piperazine, m.p. 205–206° (22), and *N*-(2-hydroxycyclohexyl)piperazine, m.p. 67–68° (22) (the latter separable by treatment of mixt. with CS_2 pptg. its dithiocarbamate).]

[$\bar{C}$ also reacts as a secondary alcohol: e.g., $\bar{C}$ with PCl_5 yields (14) 1,2-dichlorocyclohexane [Beil. V-22, V_1-(8)], b.p. 187–189°, $\bar{C}$ with PBr_5 yields (14) 1-bromo-2-chlorocyclohexane, b.p. 94° at 17 mm., D^{20}_{-} = 1.514, n^{20}_{D} = 1.5481 (14).]

$\bar{C}$ on oxidn. with $K_2Cr_2O_7/H_2SO_4$/AcOH gives (57% yield (9)) 2-chlorocyclohexanone (3:0120).

(Note: the following derivatives are listed as *cis* on the assumption of inversion during formation.)

—— *cis*(?) **2-Chlorocyclohexanyl acetate:** oil with odor like EtOAc, b.p. 95–96° at 11 mm. (23), 99–101° at 13 mm. (24), D^{25}_{25} = 1.1182 (23), n^{25}_{D} = 1.46195 (23). [From $\bar{C}$ with AcCl at 10–20° (23) or in C_6H_6 (espec. in pres. of K_2CO_3 or $BaCO_3$) (70% yield (24)), or from cyclohexene (1:8070) with Ac_2O or with Ac_2O + SO_2Cl_2 in $CHCl_3$ (11).] [This ester with MeOH + dry HCl gas yields $\bar{C}$ (11). Cf. (25).]

—— *cis*(?) **2-Chlorocyclohexanyl benzoate:** lfts. from dil. alc., m.p. 120–121° (24). [From $\bar{C}$ with BzCl htd. 10 hrs. (70% yield) (24).]

—— *cis*(?) **2-Chlorocyclohexanyl *p*-nitrobenzoate:** cryst. from dil. alc., m.p. 240° dec. (24). [From $\bar{C}$ with *p*-nitrobenzoyl chloride in dry ether or C_6H_6 + Na_2CO_3 refluxed 5 hrs. (70% yield) (24).]

—— *cis*(?) **2-Chlorocyclohexanyl *N*-phenylcarbamate:** m.p. 97–98° (2), 94–96° (17). [From $\bar{C}$ with phenyl isocyanate in lt. pet. (17).]

—— *cis*(?) **2-Chlorocyclohexanyl *N*-(α-naphthyl)carbamate:** m.p. 165° (3). [From $\bar{C}$ with α-naphthyl isocyanate at 100° for 4 hrs. (3).]

[For prepn. of $\bar{C}$ from benzyl chloride (3:8535) with Cl_2 in pres. of I_2 (11) (8) (15) or $SbCl_5$ (16) see indic. refs.; from *p*-chlorotoluene (3:8287) with SO_2Cl_2 + Bz_2O_2 in dark (70% yield) (35), with Cl_2 in light (2) (17) (11) (5) (4) (18) (19) or with $PbCl_4.2NH_4Cl$ (9) see indic. refs.; from toluene with Cl_2 see (20); for prepn of $\bar{C}$ from chlorobenzene (3:7903) with CH_2O + HCl (36), with *bis*-(chloromethyl) ether (3.5245) or chloromethyl methyl ether (3:7085) (formed by use of formaldehyde or paraformaldehyde + chlorosulfonic acid + conc. H_2SO_4 or hexamethylenetetramine + conc. HCl (3)) as directed (50% yield (3)) (1) see indic. refs]

[$\bar{C}$ with phenol in toluene yields (21) 2-(*p*-chlorobenzyl)phenol, m.p. 60–61°, and *p*-chlorobenzyl phenyl ether, m.p. 85 5–86.5°; $\bar{C}$ with 2,4-dichlorophenol in toluene yields (21) 2-(*p*-chlorobenzyl)-4,6-dichlorophenol, m.p. 69.5–70.5°, and *p*-chlorobenzyl 2,4-dichlorophenyl ether, m.p. 64.5–65 5°.]

[$\bar{C}$ with phenol + $AlCl_3$ yields (21) 4-(*p*-chlorobenzyl)phenol, m p. 87–87 5° (benzoate, m p. 115–116°); $\bar{C}$ with 2,6-dichlorophenol + $AlCl_3$ yields (21) 4-(*p*-chlorobenzyl)-2,6-dichlorophenol, m.p. 61.5–62 5° (benzoate, m p. 116–117°).]

[For condens. of $\bar{C}$ with *p*-chlorophenol (3:0475) and use of prod. as anti-moth prepn. see (22); for condens. of $\bar{C}$ with *o*-cresol (1:1400) or its Na salt or with 3,5-dimethylphenol (*sym-m*-xylenol)(1:1455) and use of products as bactericides see (23); for condens. of $\bar{C}$ with sulfonated phenol and use as tanning agent see (24); for condens. of $\bar{C}$ with resorcinol (1:1530) + $AlCl_3$ in nitrobenzene yielding 55% 4-(*p*-chlorobenzyl)resorcinol see (25).]

$\bar{C}$ with Mg in dry ether yields (10) p-$Cl.C_6H_4.CH_2$ MgCl which with phenyl isocyanate as directed (10) gives *p*-chlorophenylacetanilide [Beil. XII-275], lfts. from alc., m p. 168° cor. (26), 165–166° u.c. (10), 164.5° (27)

$\bar{C}$ on boilg. with aq. (2) (3) hydrolyzes to *p*-chlorobenzyl alc. [Beil. VI-444], m.p 70–71° (3) (for rate see (7)); $\bar{C}$ on boilg. with $Pb(NO_3)_2$ for 2 days (28) or on boilg in 60% alc. with hexamethylenetetramine (29) yields *p*-chlorobenzaldehyde (3:0765), m.p. 46–47° (3).

$\bar{C}$ with alc. KOH yields (30) *p*-chlorobenzyl ethyl ether [Beil. VI-444, VI_1-(222)], oil, b.p. 225° (for study of rate of reactn. see (31)); $\bar{C}$ with KOAc in abs. alc. yields (28) *p*-chlorobenzyl acetate [Beil. VI-445], b.p. 240° (28); $\bar{C}$ with boilg. alc. KCN yields (11) (28) (20) *p*-chlorobenzyl cyanide [Beil. IX-448], m p. 30° (20), b.p. 265–267° (20), which on hydrolysis yields *p*-chlorophenylacetic acid (3:3135), m p. 105° (20).

$\bar{C}$ with KI in alc. gives alm. quant. yield (17) *p*-chlorobenzyl iodide, m.p. 64° (17) (for study of rate of reactn. of $\bar{C}$ with NaI (34) or KI (14) (6) in acetone see indic. refs.); $\bar{C}$ with Na_2SO_3 yields (18) (13) sodium *p*-chlorotoluene-ω-sulfonate (corresp. sulfonamide, m.p. 157° (18), corresp. sulfonanilide, m p. 235° (18)).

[$\bar{C}$ with thiourea (1 mole) in alc refluxed 30 min. gives (37) *S*-(*p*-chlorobenzyl)isothiourea hydrochloride (*p*-chlorobenzyl isothiuronium chloride), cryst. from 1:1 conc. HCl + aq., m p. 197°; this prod. is useful in identification of organic acids (37)]

$\bar{C}$ on oxidn. with CrO_3 (11) (3) or with $KMnO_4$ (1) (12) yields *p*-chlorobenzoic acid (3:4940), m p. 236°.

3:0255 *m*-CHLOROPHENOL

C_6H_5OCl

Beil. VI - 185
VI_1-(99)
VI_2-(172)

M.P. 32.8°	(1)	B.P. 215.5–217.1°	(7)	$D^{50}_{-} = 1.237$ (9)		$n^{40}_{D} = 1.5565$ (1)
32°	(2)	216°	(17)	$D^{25}_{-} = 1.268$ (9)		
31–32°	(3)	213–216°	(8)			
31°	(4)	214° (6) cor.	(16)			
28.5°	(5)	211–212° u.c.	(5)			
28°	(6)	98° at 12 mm.	(2)			

C̄ has odor like phenol (for study of strength of odor in aq soln. see (10)). — C̄ in pres. of aq. has unusual tendency to form supersatd. solns (11) (for temp./compn. data on soly. of C̄ in aq. or in C_6H_6 see (11)). — C̄ cas. discolors in air.

[For prepn. of C̄ from *m*-chloroaniline [Beil XII-602, XII_1-(300)] via diazotization and subsequent reaction with aq (yields: alm. quant. (12) (13), 67% (1), 64% (8), 55% (4), 50% (14)) (15) (5) (16) see indic. refs. (note that the process is sensitive to conditions and refs. indic. give valuable information on its control); for formn. of C̄ from *m*-dichlorobenzene (3:5960) with NaOMe in MeOH in s.t. at 180° for 30 hrs. see (17).]

C̄ like its isomers is sol. in conc. Na_2CO_3 soln at room temp and is repptd. by CO_2 (18). [For studies of value of ionization const. of C̄ in aq. or dil. MeOH or dil. EtOH see (19) (20) (6) (21) (22).]

C̄ on fusion with KOH yields (23) resorcinol (1:1530). — [For condens. of C̄ with phthalic anhydride to yield 3,6-dichlorofluorane ("fluorescein chloride") [Beil. XIX-147] (impt. intermed. in prepn of rhodamine dyes) see (12) (68).]

[C̄ conv. to dry Na salt and treated with CO_2 under press. yields after acidifn. (14) 6-carboxy-3-chlorophenol (4-chloro-2-hydroxybenzoic acid) (4-chlorosalicylic acid) (3.4908), ndls. from aq., m.p. 207° (14).]

[C̄ in the Reimer-Tiemann reactn. with alk. (or better $Ca(OH)_2 + Na_2CO_3$ (24)) and chloroform (24) or bromoform (25) yields both 6-aldehydo-3-chlorophenol (4-chlorosalicylaldehyde) (3.0960) and 4-aldehydo-3-chlorophenol (3 4280) in *o*/*p* ratio of 0.71 with $CHCl_3$ (26) (25) and 0.84 with $CHBr_3$ (25).] — [The 4-aldehydo-3-chlorophenol has also been obtd. (50% yield) from C̄ in C_6H_6 with HCl + HCN + ACl_3 (29).]

[C̄ in aq. Na_2CO_3 soln. couples with 1 equiv. of benzenediazonium chloride yielding (27) (18) 3-chloro-4-phenylazophenol, or.-yel. ndls. from 25% AcOH, m p. 95° (27), or, on expos. to HCl, or.-red, m p 114° (27) (18); C̄ in aq NaOH with 2 equivs. of benzenediazonium chloride yields (27) 3-chloro-2,4-*bis*(phenylazo)phenol, dark red-brn, m p. 181°; no *tris*-azo cpds. appear to be formed (27) — For study of coupling of C̄ with *p*-nitrobenzenediazonium bisulfate see (28).

[C̄ is *not* reduced by HI in AcOH (30); for study of replacement of Cl by H with H_2 + Ni cat. at room temp. see (31).]

[C̄ with *p*-aminophenol oxidized in alk. soln. with NaOCl yields (32) indochlorophenol; C̄ with *p*-aminodimethylaniline on oxidn with NaOCl as directed (8) yields 3-chloro-*N*,*N*-dimethylindoaniline.]

[For condensation of C̄ with formaldehyde (33) or with benzaldehyde-*o*-sulfonic acid (34) and use of product as mothproofing agents see indic refs.; for reactn. of C̄ with unsatd. halides in pres of alk. yielding *m*-chlorophenyl alkenyl ethers which by rearr. yield corresp. substituted phenols used as bactericides see (35) (36).]

[For condens. of C̄ with malic acid (1.0450) + conc. H_2SO_4 giving small yield of 7-chlorocoumarin [Beil. XVII-331] see (37); with ethyl acetoacetate (1:1710) + H_2SO_4

giving small yield of 7-chloro-4-methylcoumarin [Beil. XVII-336] see (37); with ethyl methylacetoacetate (1:1712) + P_2O_5 yielding 7-chloro-2,3-dimethylchromone [Beil. $XVII_1$-(177)] see (38).]

$\bar{C}$ with 3 moles Br_2 (in aq. KBr) gives 100% yield (39) 2,4,6-tribromo-3-chlorophenol, ndls. from dil. alc., m.p. 105–106° cor. (39) (methyl ether, m.p. 96° (39)); $\bar{C}$ in 10% aq. KOH with 4 moles I_2 (in aq. KI) gives 2,4,6-triiodo-3-chlorophenol, ndls. from boilg. AcOH, m.p. 139–140° (39).

[$\bar{C}$ in dil. NaOH mixed with aq. $NaNO_2$ and acidified as directed (40) gives (40% yield (40)) (43) 3-chloro-4-nitrosophenol, m.p. 133° (40), 129.6° (41); on soln. in Na_2CO_3 and subsequent acidification this cpd. yields (40) (43) the isomeric 3-chlorobenzoquinone-4-monoxime, m.p. 184° dec. (40), cf. (42).]

[$\bar{C}$ on mononitration with H_2SO_4 + $NaNO_3$ as directed (44) or $\bar{C}$ in AcOH with fumg. HNO_3 at 0° (45) gives (yield: 32% (45), 22% (44)) 3-chloro-6-nitrophenol [Beil. VI-238], volatile with steam, m.p. 41° (44), together with (60% yield (44)) 3-chloro-4-nitrophenol [Beil. VI-240], not volatile with steam, white ndls. from dil. HCl or aq., m.p. 121–122° (44). — Note that the two other position isomers although known have been obtd. indirectly: 3-chloro-2-nitrophenol, anhydrous form, yel. cryst., m.p. 45–47° (46) (47); monohydrate, colorless cryst. from pet. ether, m.p. 37.5–38° (46) (47) (44); 3-chloro-5-nitrophenol [Beil. VI-239] (48), m.p. 147°.]

[$\bar{C}$ on dinitration as directed (44) (49) gives 3-chloro-4,6-dinitrophenol [Beil. VI-259, VI_1-(128)], colorless cryst. from aq. or lt. pet., m.p. 92–93° (44). — Note that two other position isomers are known but prepd. indirectly: 3-chloro-2,6-dinitrophenol, white cryst. from dil. HCl, m.p. 114.5° (44) (49); 3-chloro-2,4-dinitrophenol, cryst. from aq., m.p. 138–140° (44) (49).]

$\bar{C}$ on trinitration by soln. in 1½ pts. fumg. H_2SO_4 (27% SO_3) and treated in cold for 1 hr. with 10 pts. 70% HNO_3 (44) cf. (4) (50) yields 3-chloro-2,4,6-trinitrophenol [Beil. VI-292], cryst. from aq. or dil. H_2SO_4, m.p. 114° (44), 116° (4), 119° (50). — [Note that if $\bar{C}$ is sulfonated prior to trinitration the isomeric 3-chloro-2,5,6-trinitrophenol, m.p. 112.5–113.5° (44), is obtd. (44).]

[For studies on the sulfonation of $\bar{C}$ see (44) (51) (52) (53).]

[$\bar{C}$ in MeOH/KOH with MeI yields (29) m-chlorophenyl methyl ether (m-chloroanisole) (8:6195).] [$\bar{C}$ in EtOH/KOH with EtI gives (18) 3-chlorophenyl ethyl ether (m-chlorophenetole) (3:6323), b.p. 204–205° at 717 mm., D_4^{20} = 1.1712 (18) (for rate of formn. from sodium salt of $\bar{C}$ with EtI in alc. soln. see (55)).]

—— **m-Chlorophenyl acetate** [Beil. VI-185]: oil, b.p. 116.5° at 21 mm. (18), 108° at 12 mm. (57), 84–86° at 2 mm. (57), m.p. −1.5° to −0.5° (18), D_4^{20} = 1.2209 (18). [From $\bar{C}$ with Ac_2O + NaOAc (18) or indirectly from m-chloroaniline via diazotization, etc. (57).] [For rate of reactn. of $\bar{C}$ with AcBr see (58).]

Ⓓ **m-Chlorophenyl benzoate** [Beil. IX-117]: pr. from dil. alc. or dil. acetone, m.p. 71–72° (18). [From $\bar{C}$ in 10% aq. Na_2CO_3 with BzCl (18); for study of rate of benzoylation of $\bar{C}$ see (59).]

Ⓓ **m-Chlorophenyl m-nitrobenzoate**: ndls. from alc. or dil. acetone, m.p. 94–95° (18). [From $\bar{C}$ in alk. with m-nitrobenzoyl chloride (18).]

Ⓓ **m-Chlorophenyl p-nitrobenzoate**: m.p. 99°.

Ⓓ **m-Chlorophenyl 3,5-dinitrobenzoate**: m p. 156°.

—— **m-Chlorophenyl benzenesulfonate**: unrecorded.

—— **m-Chlorophenyl p-toluenesulfonate**: unrecorded.

—— **m-Chlorophenyl benzyl ether**: m.p. 59°. [From $\bar{C}$ + benzyl-phenyl-dimethyl-ammonium chloride (60).]

—— **m-Chlorophenyl p-nitrobenzyl ether**: unrecorded.

—— *m*-**Chlorophenyl 2,4-dinitrophenyl ether:** pale yel. ndls. from alc., m.p. 75° (61). [From C̄ in alk. with alc. 2,4-dinitrochlorobenzene (61).]

Ⓓ *m*-**Chlorophenoxyacetic acid:** cryst. from aq., m.p. 108–110° u.c. (62), Neut. Equiv. 186.5. [From C̄ in aq. NaOH with chloracetic acid (62).]

—— *m*-**Chlorophenyl *N*-phenylcarbamate:** unrecorded.

Ⓓ *m*-**Chlorophenyl *N*-(*p*-bromophenyl)carbamate:** ndls. from C_6H_6 + EtOAc, m.p. 121–123° cor. (64). [From C̄ + *p*-bromobenzazide in lgr. (64).]

Ⓓ *m*-**Chlorophenyl *N*-(*p*-iodophenyl)carbamate:** m.p. 138–139° (69). [From C̄ with *p*-iodobenzazide in hot lgr. (69).]

Ⓓ *m*-**Chlorophenyl *N*-(*m*-nitrophenyl)carbamate:** m.p. 115–116° u.c., 117–118° cor. (70). [From C̄ with *m*-nitrobenzazide or with *m*-nitrophenyl isocyanate in lgr. (70).]

Ⓓ *m*-**Chlorophenyl *N*-(*p*-nitrophenyl)carbamate:** pale yel. pr. from lgr., m.p. 144° cor. (65). [From C̄ + *p*-nitrobenzazide in lgr. (65).]

Ⓓ *m*-**Chlorophenyl *N*-(3,5-dinitro-4-methylphenyl)carbamate:** or.-yel. pr. from lgr., m.p. 170–172° u.c., 174–176° cor. (63). [From C̄ with 3,5-dinitro-4-methylbenzazide in lgr. (63).]

Ⓓ *m*-**Chlorophenyl *N*-(α-naphthyl)carbamate:** cryst. from lgr., m.p. 157–158° (66). [From C̄ + α-naphthyl isocyanate in lgr. (66).]

Ⓓ *m*-**Chlorophenyl *N*-(β-naphthyl)carbamate:** pr. from lgr., m.p. 114–115° u.c., 116–117° cor. (67). [From C̄ + β-naphthyl isocyanate (or azide) in lgr. (67).]

—— *m*-**Chlorophenyl *N*,*N*-diphenylcarbamate:** unreported.

3:0270 *d,l*-β-CHLORO-*n*-VALERIC ACID $C_5H_9O_2Cl$ Beil. S.N. 162

$CH_3.CH_2.CH(Cl).CH_2.COOH$

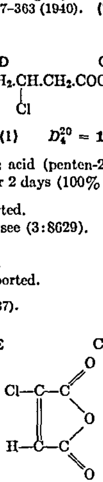
M.P. 33° (1) **B.P. 112° at 10 mm. (1)** D_4^{20} = **1.1484 (1)** n_D^{20} = **1.4462 (1)**

[For prepn. of C̄ from propylidene-acetic acid (penten-2-oic acid-1) [Beil. II-426, II_1-(191), II_2-(399)] with dry HCl gas at 20° for 2 days (100% yield) see (1).]

—— Methyl β-chloro-*n*-valerate: unreported.
—— Ethyl β-chloro-*n*-valerate: b.p. 189° see (3:8629).
—— β-Chloro-*n*-valeramide: unreported.
—— β-Chloro-*n*-valeranilide: unreported.
—— β-Chloro-*n*-valero-*p*-toluidide: unreported.

3:0270 (1) Schjanberg, *Ber.* **70**, 2385–2391 (1937).

3:0280 CHLOROMALEIC ANHYDRIDE C_4HO_3Cl Beil. XVII-434 $XVII_1$—



M.P.	B.P.			
33° (1)	196.3° cor. (2)		D_{25}^{25} = 1.5421 (2)	$n_{He}^{16.7}$ = 1.50594 (1)
34.5° (2) (3)	194°		D_4^{15} = 1.5427 (1)	$n_{He}^{13.9}$ = 1.50933 (1)
	150–151°	at 210 mm. (2)		
	95°	at 25 mm. (3A)		
	87°	at 14 mm. (1)		
	78°	at 8 mm. (1)		

C̄ usually observed as a colorless oil. On cooling and scratching it solidifies to a cryst. mass fusing about 0° and suddenly changing to a hard cryst. form, m.p. 34.5°, with evoln. of ht. (2) (3).

[For prepn. from chlorofumaric ac. (3:4853) by distn. with P_2O_5 see (1) (4), by distn. with $POCl_3$ see (5) (such products are claimed by (1) to be impure); for prepn. by distn. with AcCl see (2); for still other methods see Beil. XVII-434.]

[For Diels-Alder addn. of C̄ to cyclopentadiene-1,3 (1:8030) giving 71% yield of prod. m.p. 161°, or to anthracene (1:7285), giving 56% yield of prod., m p. 157°, see (7); note, however, that C̄ with isoeugenol (1:1785) or with isosafrole (1·7610) not only adds but also loses HCl giving (8) derivs. of 3-methyl-3,4-dihydronaphthalene-1,2-dicarboxylic anhydride.]

C̄ reacts with aq. evolving ht. and upon evapn. yields (3) (3A) (6) chloromaleic ac. (3:3432), cryst. from mixt. of $CHCl_3$ + AcOH (6), which after drying at 100° have m.p. 114–115° (6).

3:0280 (1) von Auwers, Harres, *Ber.* **62**, 1686–1687 (1929). (2) Perkin, *J Chem. Soc.* **53**, 703–705 (1888). 		101°	at 2 mm.	(16)	

White cryst., sol. in CCl_4 and in pet. eth. — Note that the name cinnamoyl chloride avoids confusion with cinnamyl chloride, $C_6H_5.CH{=}CH.CH_2Cl$ (3:0010).

[For prepn. of C̄ from cinnam
PCl_3 (19) (15) (6), with PCl_3 + [illegible]
90-95% (13), 89% (11)) (62) (1 [illegible]
in pres. of tertiary bases (20), with p-toluenesulfonyl chloride in pyridine or diethylaniline
[illegible] innamic acid (1:0735) with oxalyl (di)chloride
[illegible]
[illegible] oily prod. which with aq. hydrolyzes to a mixt. of cinnamic acid dichloride [Beil. IX-514, IX_1-(200)], m.p. 167°, and allocinnamic acid dichloride [Beil. IX-514], m.p. 84°; C̄ in CCl_4 with Cl_2 in direct sunlight, however, yields (5) α,β-dichloro-β-phenylpropionyl chloride (the acid chloride of cinnamic acid dichloride), ndls. from pet. eth., m.p. 54-55° (5), 55° (23).]

[C̄ is not reduced by copper hydride (24) but on cat. hydrogenation as directed (25) (26) yields cinnamaldehyde (1:0245).] [C̄ with KCN + quinoline gives (34% yield (57)) 1-cinnamoyl-2-cyano-1,2-dihydroquinoline which on acid hydrolysis yields 30% cinnamaldehyde (1:0245).]

[C̄ with 5% H_2O_2 in acetone + pyridine yields (27) di-cinnamoyl peroxide, m.p. 144° (27).]

[C̄ with anhydrous neutral K oxalate (28), or with dil. aq. KOH + methylaniline or dimethylaniline (29) or with pyridine (30), or with excess $K_2S_2O_5$ in pyridine (31), or with Na cinnamate (6), yields cinnamic anhydride [Beil. IX-586, IX_1-(232)], ndls. from C_6H_6 or alc., m.p. 136° (30).] — [C̄ with aq. under certain conditions yields cinnamic anhydride + HCl (for use in micro detn. of aq. (2), or indirectly for micro detn. of O_2 (after combustion), see (4) (32)).]

[For reactn. of C̄ with diethyl malonate (1 mole) + Na (2 moles) see (33); for reactn. of C̄ with ethyl sodio-acetoacetate giving (60% yield (10)) (34) ethyl *α-cinnamoylacetoacetate*, m.p. 44° (10) (Cu enolate, m.p. 164° (10)), with methyl sodio-acetoacetate giving (35) methyl α-cinnamoylacetoacetate, m.p. 49-50° (35), with ethyl sodio-benzoylacetate giving (10) ethyl cinnamoyl-benzoyl-acetate (*Cu enolate, m p. 202° (10)*), or with sodio-benzoylacetone giving (36) benzoyl-cinnamoyl-methane, m.p. 111° u.c. (36), see indic. refs.]

[$\bar{C}$ with C_6H_6 + $AlCl_3$ in CS_2 gives (37) (38) (39) (41) (by combined ring closure and addition to the unsatd. linkage or vice versa) 3-phenylhydrindone-1 (3-phenylindanone-1) [Beil. VII-483, VII_1-(265)], cryst. from MeOH, m.p. 78° (37), 77–78° (39) (oxime, m.p. 141° (40), phenylhydrazone, m.p. 130° (40), *p*-nitrophenylhydrazone, m.p. 220–221° (39), semicarbazone, m p. 223–225° (39)), accompanied by *β,β*-diphenyl-propiophenone (1,3,3-triphenylpropanone-1) [Beil. VII-524, VII_1-(293)] (38) *and other prods.: note that under* similar conds (41) with toluene or *o*-xylene neither of the corresp. indanones is formed (see also below); however, $\bar{C}$ + *m*-xylene + $AlCl_3$ in CS_2 yields (41) 5,7-dimethyl-3-phenylindanone-1, m p. 101° (semicarbazone, m.p. 195–197° (41)), and $\bar{C}$ + *p*-xylene + $AlCl_3$ in CS_2 yields (41) 4,7-dimethyl-3-phenylindanone-1, m p 94–95° (oxime, m.p. 218–219°; phenylhydrazone, m p. 193–194°; semicarbazone, m.p. 232° (41)).]

[$\bar{C}$ with many arom. cpds. in pres. of $AlCl_3$ condenses with loss of HCl to yield corresp. benzalacetophenone (chalcone) derivs.: $\bar{C}$ with C_6H_6 + $AlCl_3$, however, gives no (41) chalcone (see above); $\bar{C}$ with toluene + $AlCl_3$ yields (41) 4′-methylchalco… ; $\bar{C}$ with *o*-xylene + $AlCl_3$ in CS_2 gives (63% yield (41)) 3′,4′… , (41), $\bar{C}$ with *m*-xylene + $AlCl_3$ in CS_2 yiel… at 11 mm. (41); $\bar{C}$ with biphenyl + … 4′-phenylchalcone, m p. 155–156° (45), 165° (11…

[Similar chalcone formation occurs w… …ny arom. ethers; e g., $\bar{C}$ with anisole + $AlCl_3$ in CS_2 gives (42) 4′-methoxychalcone [Beil. VIII-193, $VIII_1$-(580)], m.p. 106–107° (42); $\bar{C}$ similarly with phenetole gives (42) 4′-ethoxychalcone [Beil. VIII-193], m p. 74–75° (42); $\bar{C}$ similarly with methyl *p*-tolyl ether gives (43) not only 2′-methoxy-5′-methylchalcone, m.p. 55–56°, but also by demethylation 2′-hydroxy-5′-methylchalcone, m p. 111° (43); $\bar{C}$ similarly with methyl 3,4-dimethylphenyl ether yields (13) 4′,5′-dimethyl-2′-methoxychalcone, m p. 78° (13); *$\bar{C}$ similarly with methyl β-naphthyl ether yields (44) β-methoxy*-naphthochalcone, m p 138–140° (44); $\bar{C}$ similarly with diphenyl ether yields (37) 4′-phenoxychalcone, m p 85° (37): for extension of this reactn. to ethers of polyhydric phenols such as $\bar{C}$ + $AlCl_3$ + *catechol dimethyl ether (veratrole) (1:7560) (44), resorcinol dimethyl* ether (1:7570) (13), resorcinol diethyl ether (1·7585) (13) (43), hydroquinone diethyl ether (1:7185) (43), and pyrogallol trimethyl ether (1.7145) (44) see indic. refs.]

[Similar formation of substituted chalcones occurs with $\bar{C}$ + $AlCl_3$ + phenols; e.g., for cases of $\bar{C}$ with *o*-cresol (1:1400) (46), resorcinol (1:1530) (47), phloroglucinol (1:1620) *(47) cf. (48) see indic. refs.]*

[$\bar{C}$ with diazomethane in ether gives (49) (50) (note both replacement of Cl and addn. to unsatd. linkage) 5-(diazoacetyl)-4-phenylpyrazoline, cryst. from C_6H_6 + pet. eth.; m.p. 80–81° (49), 77–78° (50)]

[$\bar{C}$ + NaN_3 in ether gives (12% yield (51)) (52) cinnamoyl azide, cryst. from lgr., m p. 86° dec. (51) (52); this cpd. on htg above m p or preferably in C_6H_6 readily loses N_2 and rearr. giving (77% yield (53)) (51) (52) styryl isocyanate, b p. 107° at 12 mm.; this isocyanate (or even its azide precursor) with aq at 50° yields (51) *N,N′*-distyrylurea, m p. 213–214° (51); for its reactn. with MeOH *yielding (52) methyl N-styrylcarbamate, m.p. 126°, with* EtOH yielding (52) ethyl *N*-styrylcarbamate, m p. 87°, with ammonia gas in dry ether yielding (51) *N*-styrylurea, m p 143°, or with aniline yielding (52) *N*-phenyl-*N*-styrylurea, m.p. 217°, see indic. refs.]

[$\bar{C}$ with free NH_2OH in C_6H_6 gives (100% yield (16)) cinnamoylhydroxamic acid, cryst. from hot EtOAc by addn. of lgr , m p. 119.5° (16), 111.5° (54)]

[$\bar{C}$ htd. with urea at 70° gives (44% yield (55)) (56) *N*-cinnamoylurea, m.p. 208–209° (55), 197° (56).]

[For reactn. of $\bar{C}$ with C_6H_5MgBr see (58); for reactn. of $\bar{C}$ with cellulose see (59); for reactn. with *o*-aminothiophenol yielding 1-styrylbenzothiazole see (60); for reactn. of $\bar{C}$

3:0370 3,5-DICHLOROBENZAL (DI)CHLORIDE $C_7H_4Cl_4$ **Beil. S.N. 466**

M.P. 36.5° (1)

Colorless cryst. from MeOH or from dil. AcOH; eas. sol. usual org. solv. [Note that C̄ has same m.p. as the closely related 3,5-dichlorobenzyl chloride (3:0350) but that a mixture of the two becomes liquid.]

[For prepn. of C̄ from 3,5-dichlorobenzaldehyde (3:1475) with PCl_5 (80% yield) see (1).]

C̄ on hydrolysis with fumg. H_2SO_4 as directed gives (71–80% yield (1)) 3,5-dichlorobenzaldehyde (3:1475) (for study of rate of hydrol. in 50% alc. at 83.5° see (2)).

3:0370 (1) Asinger, Lock, *Monatsh.* **62**, 347 (1933). (2) Asinger, Lock, *Monatsh.* **62**, 337–338 (1933).

3:0372 2,4,6-TRIMETHYLBENZYL CHLORIDE $C_{10}H_{13}Cl$ **Beil. S.N. 469**
(α^2-Chloroisodurene)

M.P. 37° (1) (2) (3) (4) B.P. 130–131° at 22 mm. (1)
121–123° at 19 mm. (2)
119° at 15 mm. (4)
114–115° at 10 mm. (3)

[*See also the isomeric* 2,4,5-*trimethylbenzyl chloride* (3:9702).]

Colorless cryst. from alc. (4). — C̄ blisters skin (3). — [Equiv. conductance of C̄ in liq. SO_2 is 10 times that of benzyl chloride (3:8535) (3) cf. (5).]

PREPARATION OF C̄

[For prepn. of C̄ from 1,3,5-trimethylbenzene (mesitylene) (1:7455) with formalin (1:0145) + conc. HCl + HCl gas at 55° for 5½ hrs. (yields: 55–61% (1), 29% (3)) (some α^2,α^4-dichloropentamethylbenzene = *bis*-1,3-(chloromethyl)2,4,6-trimethylbenzene, cryst. from pet. eth., m.p. 105° (1) (3), is also formed) see indic. refs.]

[For prepn. of C̄ from mesitylene (1:7455) with chloromethyl methyl ether (3:7085) + $SnCl_4$ (yields: 60% (4) cf. (6)), or in AcOH without other cat. (yields: 80–85% (7), 80% (2)), or with chloromethyl ethyl ether (3:7195) + $SnCl_4$ in CCl_4 soln. at −5° (70% yield (8)), see indic. refs.]

CHEMICAL BEHAVIOR OF C̄

Reduction. [C̄ with H_2 + Pt cat. in alc. soln. gives (80% yield (2) cf. (7)) 1,2,3,5-tetramethylbenzene (isodurene) [Beil. V-430, V_2-(329)] (9), liquid, b.p. 195–197° at 760 mm., f.p. −24°, $D_4^{20} = 0.8906$.]

Hydrolysis. C̄ on hydrolysis (no details (2)) gives 2,4,6-trimethylbenzyl alc. (mesitylcarbinol), ndls. from alc., m.p. 89° (2), 88–89° (10) (3) (11), 87° (12) (corresp. *N*-phenylcarbamate, m.p. 124–125° (11)).

Conversion to ethers. [$\bar{C}$ with MeOH/KOH at 100° for 3 hrs. gives (79% yield (3)) methyl 2,4,6-trimethylbenzyl ether, oil, b.p. 109–110° at 15 mm. (3), $\bar{C}$ with EtOH/KOH similarly gives (77% yield (3)) ethyl 2,4,6-trimethylbenzyl ether, oil, b.p. 114–115° at 14 mm. (3).]

Conversion to esters. [$\bar{C}$ with AgOAc in AcOH at 100° for 3 hrs. gives (70% yield (3)) 2,4,6-trimethylbenzyl acetate, oil, b.p. 136–137° at 15 mm. (3); this ester on hydrolysis with 15% aq. KOH at 100° for 3 hrs. gives (91% yield (3)) 2,4,6-trimethylbenzyl alc., m.p. 88–89°. (See also above.)]

Conversion to nitrile. $\bar{C}$ in alc. with aq. NaCN (1) (13) or KCN (4) (8), or C with CuCN in pyridine (14) cf. (1), gives (yields: almost 100% (13), 89–93% (1)) mesitylacetonitrile, cryst. from pet. eth., m p. 79–80° (1), 79° (4); b p. 160–165° at 22 mm. (13), 150–155° at 15 mm. (4), 190° at 11 mm. (8); this nitrile on hydrolysis with abt. 50% H_2SO_4 under reflux for 6 hrs. gives (87% yield (1)) mesitylacetic acid [Beil. IX-563, IX_1-(219)], cryst. from dil. alc. or lgr., m.p. 167–168° (1) (note that partial hydrolysis may give mesitylacetamide, m p. 216° (8)).

Behavior of $\bar{C}$ with Organometallic Compounds

With MeMgI. [$\bar{C}$ with MeMgI in dry ether undergoes mainly a coupling reaction giving (86% yield (15)) 1,2-dimesitylethane, m.p. 117.0–117.5°, accompanied by a little ethylmesitylene (1-ethyl-2,4,6-trimethylbenzene), b p 212–214° (15), 210° at 725 mm. (16), D_{20}^{20} = 0.894 (16), n_D^{20} = 1.5074 (16) (corresp. dinitro deriv., m.p. 111° (17), 109–111° (17) (15)).]

With misc. reactants. [$\bar{C}$ with diethyl sodiomalonate gives (4) diethyl α-(2,4,6-trimethylbenzyl)malonate, m.p. 36°, b p. 195–197° at 15 mm. (4). — $\bar{C}$ with ethyl sodiobenzoylacetate gives (21% yield (18)) ethyl α-(2,4,6-trimethylbenzyl)benzoylacetate which upon alk. hydrolysis gives (45% yield (18)) the ketone 1-benzoyl-2-mesitylethane, ndls. from MeOH, m.p. 85.0–85.5° (18).]

Other Reactions of $\bar{C}$

[$\bar{C}$ (1 mole) with hexamethylenediamine (1 mole) in $CHCl_3$ refluxed 3 hrs. gives (96% yield (19)) corresp. quaternary salt, $\bar{C}.C_6H_{12}N_4$: this prod. in aq. refluxed 4 hrs does *not* give the expected mesitaldehyde but instead (75% yield (19)) di-(2,4,6-trimethylbenzylamino)methane, cryst. from alc., m.p. 151.5–152° (19)]

Ⓓ *N*-(2,4,6-Trimethylbenzyl)phthalimide: ndls. from alc., m p. 209.5–210° (19). [From $\bar{C}$ with K phthalimide at 170–180° for 4 hrs. as directed (19) (63% yield (19)).]

	39°	(8) (9)		**105–107°** at 20 mm.	(14)
	38.5–39.5°	(10)		**108°** at 12 mm.	(1)

Lfts. from lgr or pet. eth — Very eas. sol. aq., alc., $CHCl_3$; spar. sol. dry ether. — Fairly hygroscopic. — C̄ on boilg. slightly dec. to HCl + acrylic ac. (1:1020). [Note that samples with m.p. higher than 42° may have contd. adipic ac. (8).] [For stability of C̄ in aq. soln. see (8).]

[For prepn. of C̄ from acrolein (1:0115) via addn. of HCl to β-chloropropionaldehyde (3:5576) and subsequent oxidn. with fumg. HNO_3 (yield: 65–70% (14), 60–65% (15), 50% (1)) see (15) (14) (7) (1) (16); from 3-chloropropanol-1 (trimethylene chlorohydrin) (3:8285) by oxidn. with conc. HNO_3 (yield: 78–79% (9)) (17) (13) (27) or alk. $KMnO_4$ (18) see indic. refs.; from β-hydroxypropionitrile (ethylene cyanohydrin) by hydrolysis with HCl see (10); from phosgene + ethylene + $AlCl_3$ via hydrolysis of intermediate β-chloropropionyl chloride (3:5690) see (19); for other methods see Beil. II-249.]

C̄ on htg. with aq. alk. or alk. carbonates (1) (7) (19) or on passing over activated carbon at 230–240° at 250–320 mm. (21) loses HCl and yields acrylic ac. (1:1020). [The alk. salts of C̄ dec. even at ord. temp. giving alk. chlorides (3).] [For example of use of C̄ as source of acrylic acid in Diels-Alder addn. reactions see under 9,10-dichloroanthracene (3:4916).]

C̄ with PCl_3 (12) or $SOCl_2$ (22) yields β-chloropropionyl chloride (3:5690) q.v., b p. 144°.

C̄ (1 g.) + pyridine (2 g.) htd. at 100° solidifies after 2 hrs. to give 100% yield addn. cpd. $\bar{C}.C_5H_5N$, pr. from abs. alc., m p. 160° (26).

—— Methyl β-chloropropionate: b.p. 148–150° at 760 mm. (3:5765)

—— Ethyl β-chloropropionate: b.p. 162–163° at 760 mm. (3:8290).

—— β-Chloropropionamide: unrecorded.

Ⓓ β-Chloropropionanilide: cryst. from aq. or MeOH, m.p. 119° (23). [From β-chloropropionyl chloride + aniline in acetone in 90% yield (23).]

Ⓓ β-Chloropropion-*p*-toluidide: cryst. from MeOH, m.p 121° (23) (22).

Ⓓ β-Phenoxypropionic acid: ndls. from hot aq. (24) or lgr. (25); m.p. 98° (24), 97–98° (25). [From C̄ + phenol + NaOH, 36% yield (25).]

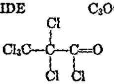
3:0470 PENTACHLOROPROPIONYL CHLORIDE C_3OCl_6 Beil. II — II_1-(112) II_2—



M.P. 42° (1)

Colorless not especially hygroscopic ndls.

[For prepn. of C̄ from trichloroacrylic acid chloride (3:5845) by addn. of Cl_2 in bright sunlight see (1).]

C̄ with $AlCl_3$ (1 mole) at 60° decomposes in two ways (1), leading on one hand to CO and hexachlorethane (3:4835), and on the other to phosgene (3:5000) and tetrachloroethylene (3:5460).

[C̄ with C_6H_6 + $AlCl_3$ yields (1) phenyl pentachloroethyl ketone (α,α,β,β,β-pentachloropropiophenone) [Beil. VII_1-(161)], m.p. 83° (1).]

C̄ on hydrolysis yields pentachloropropionic acid (3:4895).

[*See also o-chlorophenol* (3:5980).]

$\bar{C}$ has disagreeable and persistent odor (15) for study of strength of which in aq. soln. see (16). — $\bar{C}$ is spar. sol. aq. at ord. temp. (for details see (17)); but $\bar{C}$ is eas. sol. alc., ether, C_6H_6, $CHCl_3$, CS_2. — $\bar{C}$ (like its *o*-isomer (3:5980)) is volatile with steam (for studies see (18)) even from soln. in equiv. aq. NaOH (19) (dif. and sepn. from 2,4-dichlorophenol (3:0560), 2,6-dichlorophenol (3:1595), and 2,4,6-trichlorophenol (3:1673) (19).

The cryoscopic const. of $\bar{C}$ is 85.8 (20).

SELECTED DATA ON BINARY SYSTEMS CONTG. $\bar{C}$

$\bar{C}$ + aq.: for solubility/temp. data see (17).

$\bar{C}$ + C_6H_6: for solubility/temp. data (17) or for vapor-press. data (21) see indic. refs.; for association of $\bar{C}$ in C_6H_6 soln. see (30). **$\bar{C}$ + MeOH (1:6120):** for vapor-press. data see (21). **$\bar{C}$ + acetone (1:5400):** for vapor-press. data see (21). **$\bar{C}$ + methyl acetate (1:3005):** for vapor-press. data see (21).

$\bar{C}$ + nitrobenzene: for f.p./compn. data and diagrams see (24) (25), eutectic m.p. −24.5° contg. 41.5 wt. % $\bar{C}$ (24), m.p. −30.5° contg. 50.5 mol. % $\bar{C}$ (25).

$\bar{C}$ + aniline: for D_{-}^{25} and D_{-}^{50} + viscosity at 25° and 50° see (26). **$\bar{C}$ + *p*-toluidine:** for f.p./compn. and n_D^{54}/compn. data and diagrams see (4) cf. (29); note two eutectics, E_1, m.p. 21° contg. 28 mol. % $\bar{C}$, and E_2, m.p. 7.4° contg. 71 mol. % $\bar{C}$ (4). **$\bar{C}$ + benzylamine:** for f.p./compn. diagram see (27), noting two molecular cpds., one of compn. 3 $\bar{C}$.1 benzylamine, m.p. 55°, the other 1 $\bar{C}$.1 benzylamine, m.p. 16° (27). **$\bar{C}$ + phenylhydrazine:** for f.p./compn. data and diagram see (1).

$\bar{C}$ + piperidine: for n_D^{65}/compn. data see (23).

$\bar{C}$ + pyridine: for f.p./compn. diag. of entire system see (4) cf. (28) (note two eutectics, viz., E_1, m.p. −19.5° contg 66.6 mol. % $\bar{C}$, E_2, m.p. −47.3° contg. 13.5 mol. % $\bar{C}$); for n_D^{25}/compn. and n_D^{50}/compn. data over entire system see (14).

$\bar{C}$ + *o*-chlorophenol (3:5980): for f.p./compn. data and diagram see (3) (note that the eutectic, m.p. about −20.5°, conts. about 38.5 mol. % $\bar{C}$). **$\bar{C}$ + *p*-dichlorobenzene (3:0980):** for f.p./compn. diagram see (4) (note eutectic m.p. 27.2° contg. 73.4 mol. % $\bar{C}$); for n_D^{54}/compn. data see (4).

Azeotropic Systems Contg. $\bar{C}$

$\bar{C}$ with naphthalene (1:7200) forms a const.-boilg. mixt., b.p. 216.3° contg. 36.5% $\bar{C}$ (11). $\bar{C}$ with *p*-dibromobenzene forms a const.-boilg. mixt, b.p. 215.05° contg. 35% $\bar{C}$ (11).

PREPARATION OF $\bar{C}$

From *p*-chloroaniline. [For prepn. of $\bar{C}$ from *p*-chloroaniline (Beil. XII-607, XII_1-(304)] via diazotization to salts of *p*-chlorobenzenediazonium hydroxide (Beil. XVI-463, XVI_1-(355)] and hydrolysis of the latter (yields not stated) (3) (10) in an inert solvent (31) see indic. refs.; for study of rate of hydrolysis (32) of *p*-chlorobenzenediazonium chloride and influence of light thereon (33) see indic. refs.]

From phenol. [For prepn. of $\bar{C}$ from phenol (1:1420) with Cl_2 at temps. over range 40°–155° see (3) cf. (6) (35); with Cl_2 + conc. aq. Na_2CO_3 soln. see (34), by use of *N,N*-dichlorobenzenesulfonamide in $CHCl_3$ at −15° see (36) (note that evidence obtd. from this reaction in pres. of isobutylene indicates that phenyl hypochlorite is first formed and subsequently rearranges (36)); by use of *N,N'*-dichlorourea + HCl see (37), with EtOCl (3:7022) in CCl_4 at −20° see (38); or by use of SO_2Cl_2 see (39) (40) (41) (for use of SO_2Cl_2 on $NaOC_6H_5$ see (7)). — Note that in all these methods some *o*-chlorophenol (3:5980) is usually also formed.]

From *p*-aminophenol. [For formn. of $\bar{C}$ from *p*-aminophenol (Beil XIII-427, $XIII_1$-(143)] via diazotization, conversion to corresp $PtCl_4$ double salt, and dry distn. see (42); or via diazotization, conv. to corresp. $ZnCl_2$ double salt, and decompn. by addn of molten phenol (yield 40% accompanied by 41% hydroxybiphenyl + 11% diphenyl ether) see (43).]

From *p*-dichlorobenzene. [For prepn. of $\bar{C}$ from *p*-dichlorobenzene (3:0980) with MeOH/NaOMe in s.t. at 180° (44) (45), or with MeOH/NaOH in s.t. at 190–195° (90% yield (46)) or at 200° for 25 hrs. under press. (8), see indic. refs.; for use of aq. alk. or alk. earths with MeOH in pres of copper salts at 150–190° under press see (47) (note, however, that, although the hydrolysis of *p*-dichlorobenzene to $\bar{C}$ is markedly facilitated by presence of Cu, e.g., with aq. NaOH, maximum yield is 30% while with MeOH/NaOH + Cu yield is 85% (48), yet in presence of Cu_2O some ord. phenol (1:1420) is also formed (49); for prepn. of $\bar{C}$ from *p*-dichlorobenzene (3 0980) by vapor-phase hydrolysis with steam + cat. at 550–850° see (50).]

From other miscellaneous sources. [For formn of $\bar{C}$ from various *p*-chlorophenyl ethers by cleavage, e.g., from *p*-chloroanisole (3:6300) with conc. HCl in s.t. (51) or with MeOH/NaOMe in s.t. at 176° (45); from *p*-chlorophenetole (3.0090) with conc. HCl (52) or with HBr in AcOH (85% yield (53)); or from *p*-chlorophenoxyacetic acid (3:4375) with conc. HCl in s.t. at 150° (34), see indic. refs]

[$\bar{C}$ is also obtainable by hydrolysis of its various esters, but these need not be cited here.]

[For formn. of $\bar{C}$ from *p*-bromophenol with SO_2Cl_2 at ord temp see (55); from calcium salt of *p*-dichlorobenzenesulfonic acid with $Ca(OH)_2$ + Cu at 200–220° followed by removal of the sulfonic acid group from the resultant *p*-chlorophenolsulfonic acid see (56)]

BIOCHEMICAL ASPECTS OF $\bar{C}$

[For studies involving fate of $\bar{C}$ in animal metabolism see (57) (58) (59); for studies from various aspects of bactericidal and fungicidal action of $\bar{C}$ see (60) (61) (62) (63) (64) (65) (67) (68).]

[For studies from various aspects of effect of $\bar{C}$ and other chlorophenols on taste of water see (69) (70) (71) (72) (73).]

MISCELLANEOUS USES OF $\bar{C}$

[For use of $\bar{C}$ in selective solv. refining of mineral oils see (74); as denaturant for alc. see (75); as solv. for lignin see (76).]

QUANT. DETN. OF C̄

See text below under bromination of C̄, iodination of C̄, and nitration of C̄.

CHEMICAL BEHAVIOR OF C̄

PYROLYSIS OF C̄

[C̄ on pyrolysis through silica tube at red heat gives (77) 3,6-dichlorodiphenylene oxide, m.p. 188° (77).]

REDUCTION OF C̄

[C̄ with H_2 + Ni cat. in aq. or aq. alc. alk. soln. loses chlorine quant. as HCl (78) (for study of rate see (79)); note also that C̄ with Li at 220° (80) or with Ca at 160° (80) followed by treatment with aq. gives (yields 14% and 36% resp.) phenol (1:1420). — Note that C̄ with aq. Cu_2O at 250–380° under press. gives (81) phenol (1:1420) (see also above under prepn. of C̄ from p-dichlorobenzene). — Note that reduction of C̄ to 4-chlorocyclohexanol-1 (3:9376) appears to be unreported.]

OXIDATION OF C̄

[C̄ on oxidn. with 35% peracetic acid at 25° gives (82) slowly (17 days) in small yield β-chloromuconic acid (2-chlorobutadien-1,3-dicarboxylic acid-1,4), m.p. 223°, accompanied in the mother liquor by some lactone ($C_6H_5O_5Cl$) of 3-chloro-4,5-dihydroxyhexen-2-dioic acid-1,6, m p. 177° (82). — C̄ on electrolytic oxidn. gives (83) benzoquinone-1,4 (1:9025).]

NUCLEAR SUBSTITUTION OF C̄

(See also below under condensation reactions of C̄.)

Halogenation of C̄. *Fluorination.* [The fluorination of C̄ has not been reported, and no fluoro- or difluoroderiv. of C̄ is known.]

Chlorination. [C̄ with Cl_2 (2 moles) in AcOH in cold gives (80% yield (84)) 2,4-dichorophenol (3:0560), m.p. 45°; presumably C̄ with Cl_2 (3 moles) would give 2,4,6-trichlorophenol (3:1673), but such reaction is not actually reported. — For study of rate of chlorination of C̄ with Cl_2 in CCl_4 (85) or with NaOCl in alk. soln. at 25° (86), or behavior of C̄ with Cl_2 in presence of radioactive HCl in C_6H_6 soln. (87), see indic. refs.]

Bromination. [C̄ with Br_2 (1 mole) in CCl_4 at room temp. gives (62% yield (88)) 2-bromo-4-chlorophenol, m.p 33–34°, b.p. 121–123° at 10 mm. (corresp. benzoyl deriv., m.p. 99–100°) (88).]

C̄ with Br_2 (2 moles) in AcOH (89) (90) (91) or C̄ with Br_2 (2 moles) in aq. KBr soln. (92) gives (yields not stated) 4-chloro-2,6-dibromophenol, ndls. from dil. alc., m.p. 92° (89), 90° cor. (92), 89° (90) (corresp. methyl ether, m.p. 74° (92); 2,4-dinitrophenyl ether, m.p. 145–146° (90), p-toluenesulfonate, m.p. 107–108° (90)). [Note difference from the isomeric 4-chloro-3,5-dibromophenol, m.p. 121° (93), 118° (94) (corresp. Me ether, m.p. 82.5° (93), benzoyl deriv., m.p. 132° (94)).]

[C̄ with Br_2 (4 moles) in pres. of Fe powder gives (93) 4-chloro-2,3,5,6-tetrabromophenol, m.p. 215° (corresp. methyl ether, m.p. 161°, benzoyl deriv., m.p. 203° (93)).]

[For quant. detn. of C̄ by dibromination with $KBrO_3$/KBr soln. see (95) (96) (97).]

Iodination. C̄ with I_2 (1 mole) in aq. KI + conc. NH_4OH gives (88% yield (98)) 4-chloro-2-iodophenol, ndls. from $CHCl_3$ or lt. pet., m p. 78° (98) (99) (corresp. acetyl deriv., m p. 57° (98); corresp. benzoyl deriv., m.p. 88° (99), 83–84° (98); corresp. N-phenylcarbamate, m.p. 128° (99)).

C̄ with excess I_2 in aq. KI + conc. NH_4OH (98), or C̄ in alk. soln. with I_2 in aq. KI (92),

or C̃ in alk. soln. with $I_2 + KIO_3$ followed by dil H_2SO_4 (89), or C̃ with ICl (99), gives (89% yield (98)) 4-chloro-2,6-iodophenol, ndls. from alc. or lt. pet., m.p. 109° cor. (92), 108° (93) (100), 107–108° (89), 106–107° (99) (corresp. methyl ether, m.p. 79° (92); corresp. acetyl deriv., m.p. 128° (98), 127.5° (100)).

{For quant. detn. of C̃ by di-iodination using I_2 + borax sol- [illegible]}

Nitration of C̃. C̃ on mononitration with [illegible] th 30% HNO_3 in cold (103), or with nitro[illegible] H with HNO_3 (105), gives [illegible] [Beil. VI-238, [illegible] (101) (102) (corresp. [illegible] corresp. ethyl ether, m.p. 61–62° (101); cor- [illegible] (99)). — {For use of mononitration in quant. detn. of m[illegible] o-chlorophenol (3:5980) see (107) cf. (112).}

C̃ on dinitration with conc. HNO_3 (108) (or the above 4-chloro-2-nitrophenol on further nitration with fumg. HNO_3 (101)) gives 4-chloro-2,6-dinitrophenol [Beil. VI-260, VI_1-(128)], yel. ndls. or lfts. from aq., ndls. or pr. from alc., ether, or $CHCl_3$, m.p. 81° (108) (corresp. methyl ether, m.p. 66° (109), 64° (94), corresp. ethyl ether, m.p. 54–55° (110); corresp. N-phenylcarbamate cannot be prepared (111)).

Nitrosation of C̃. {Unlike the isomeric o-chlorophenol (3:5980) the nitrosation of C̃ has not been reported, and no nitroso-p-chlorophenol is known.}

Sulfonation of C̃. {C̃ with equiv. amt. fumg H_2SO_4 (D = 1.90) at 100° (113) (114) gives 4-chlorophenolsulfonic acid-2 [Beil. XI-236], deliquescent tbls. of monohydrate from aq., m.p. 75–76° (113) (for study of acid strength see (115)) — Note also that C̃ with very large excess (15 wt. pts.) fumg H_2SO_4 (20% SO_3) gives (80–85% yield (116)) a bimolecular condensation prod. of the above sulfonic acid.}

Mercuration of C̃. {C̃ with $HgO/HgSO_4$ on warming, followed by neutraliz. with NaOH, gives (117) 4-chloro-2-hydroxymercuriphenol [Beil. XVI_1-(564)]. — For other studies of mono- and di-mercuration of C̃ see (118) (119); for patents see (120) (121).}

Condensation Reactions Involving Nuclear Hydrogen of C̃

With alcohols. C̃ with alcs. contg. more than one C in pres. of conc. $HClO_4$ at 0–160° gives ultimately (although doubtless through formn. of intermediate esters followed by rearr. or intermediate formn. of olefins followed by addn.) (122) the corresp. 2-alkyl-4-chlorophenols [e.g., C̃ with isopropyl alc. (1:6135) + conc. $HClO_4$ as directed (122) gives 4-chloro-2-isopropylphenol, sol. aq. NaOH, b.p. 235–250° accompanied by 4-chloro-2,6-diisopropylphenol, insol. aq. NaOH, m.p. 260–265°].

With aldehydes. {C̃ with formaldehyde (1:0145) + conc. HCl + H_2SO_4 is claimed (123) to undergo simple chloromethylation yielding 5-chloro-2-hydroxybenzyl chloride, m.p. 85° (123); note, however, that further condensation (involving 2 additional moles of formaldehyde) may occur giving (67% yield (124)) 6-chloro-8-(chloromethyl)benzodioxane-1,3, cryst. from MeOH, m.p. 103° (124). — C̃ with formaldehyde (1:0145) + aq. alkali gives (125) 4-chloro-2,6-bis-(hydroxymethyl)phenol ("p-chlorophenol dialcohol"), m.p. 154° (126) (corresp. mono-(p-toluenesulfonate), m.p. 151° (127)); note that reaction of C̃ with 1 mole formaldehyde to give 4-chloro-2-(hydroxymethyl)phenol (5-chlorosalicyl alcohol) is not reported although the latter [Beil. VI-893], m.p. 93°, is known.}

With $CHCl_3$, chloral, or hexamethylenetetramine. {C̃ with $CHCl_3$ + EtOH + aq. NaOH (128), or C̃ with hexamethylenetetramine in anhydrous glyceroboric acid at 150–155° followed by H_2SO_4 hydrolysis (129), or C̃ with chloral + anhydrous Na_2HPO_4 at 70–75° (giving (4-chloro-2-hydroxyphenyl)-trichloromethyl-carbinol cf. (130)) followed by hydrolysis + oxidation (131), gives (18% yield (129)) 5-chloro-2-hydroxybenzaldehyde (5-chlorosalicylaldehyde) (3:2800), m.p. 99–100°.}

With CCl_4. [C̄ with CCl_4 in aq. NaOH (128) in pres. of Cu or Cu compds. (132) or C̄ with CCl_4 in alc. KOH in s.t. at 140° for 5–6 hrs. (133) gives 5-chloro-2-hydroxybenzoic acid (5-chlorosalicylic acid) (3:4705), m.p. 172°.]

With CO_2 or organic acids. [C̄ (as dry NaĀ) with CO_2 at 140–150° under press. gives (135) (136) Na salt of 5-chlorosalicylic acid (3:4705) (see also above).]

[C̄ with *o*-chlorobenzoic acid (3:4150) in MeOH/NaOMe + trace Cu powder evapd., htd. at 200°, then htd. with conc. H_2SO_4 for 15 min. gives (136) 2-chloroxanthone, m.p. 165° (136).]

With acid chlorides of organic acids. The conventional type of reaction of C̄ with acyl halides is to form the corresp. *p*-chlorophenyl esters (see also below under reactions of phenolic hydrogen of C̄); however, with C̄ acid chlorides in pres. of $AlCl_3$ the ultimate product (undoubtedly formed by rearr. of an intermediate ester) is the ketone [e.g., C̄ with benzoyl chloride (3:6240) + $AlCl_3$ in CS_2 (137) or acetylene tetrachloride (3:5750) (138) gives 4-chloro-2-benzoylphenol (5-chloro-2-hydroxybenzophenone), m.p. 95.0–95.5° (138), 94–95° (139), 94° (137), 93–94° (140), frequently accompanied by *p*-chlorophenyl benzoate, m.p. 87° (see below); for analogous behavior of C̄ with *o*-toluyl chloride (3:8740) see (138)].

With anhydrides. [C̄ with phthalic anhydride (1:0725) + $AlCl_3$ at 140–145° (141) cf. (143) or in acetylene tetrachloride (3:5750) (142) gives (70% yield (142)) *o*-(5-chloro-2-hydroxybenzoyl)benzoic acid [Beil. X_1-(470)], cryst. from hot AcOH, acetone, or alc., m.p. 202°, after sintering at 192° (142); this product ring-closes under the conditions of its formn. (141) (142) (143) (144) or with conc. H_2SO_4 at 100° (144) (142) cf. (141) giving 4-chloro-1-hydroxyanthraquinone [Beil. VIII-340, $VIII_1$-(651)], yel.-or. ndls. from AcOH or pyridine, m.p. 194° (141), 193–194° (145), 192–193° (146), 189° (142), 188° (147) (corresp. methyl ether, m.p. 168° (145), corresp. acetate, m.p. 176–177° (146)), also obtd. (70% yield (145)) directly from C̄ with phthalic anhydride (1:0725) + $AlCl_3$ + NaCl at 200–220° for 3 hrs. (See also next paragraph.)]

[Note, however, that C̄ with phthalic anhydride (1:0725) + conc. H_2SO_4 at 200° (148) (149) or in pres. of conc. H_2SO_4 + H_3BO_3 at 200° for 3½ hrs. (150) (151) (143) (152) (153) (154) (155) (156) goes further than above giving (yield: 68–74% (150)) 1,4-dihydroxyanthraquinone (quinizarin) (1:9085), cryst. from AcOH, m.p. 200–202° cor. (150).]

[C̄ with 4-chlorophthalic anhydride (3:2725) + H_3BO_3 + fumg. H_2SO_4 at 175–195° for 20 hrs. gives (157) 6-chloro-1,4-dihydroxyanthraquinone (6-chloroquinizarin), tbls. from toluene, m.p. 188° (158) (corresp. dimethyl ether, m.p. 168.5° (158); diacetate, m.p. 213° (158)). — *For completely analogous behavior under similar circumstances of C̄ with* 3,4-dichlorophthalic anhydride (3:3695) or C̄ with 4,5-dichlorophthalic anhydride (3:4830) see these cpds.]

[C̄ with 4-sulfophthalic anhydride + H_3BO_3 + H_2SO_4 at 200° for 4 hrs. gives (45% yield (159) (160) cf. (161)) 1,4-dihydroxyanthraquinonesulfonic acid-6 (6-sulfoquinizarin) [Beil. XI-357]; for study of Na salt of latter as acid-base indicator see (162).]

[For behavior of C̄ with 3-methylphthalic anhydride + $AlCl_3$ (144) (163), with 4-methylphthalic anhydride + $AlCl_3$ (163), with naphthalene-1,2-dicarboxylic acid anhydride + $AlCl_3$ + NaCl (164), or with naphthalene-2,3-dicarboxylic acid anhydride + $AlCl_3$ + NaCl (165), see indic. refs.]

With esters of keto acids. [C̄ (1 mole) with ethyl acetoacetate (1:1710) + conc. H_2SO_4 stood 24 hrs. gives (2.7% yield (166)) 6-chloro-2-methylcoumarin [Beil. XVII-336, $XVII_1$-(173)], m.p. 186–187° (167), 186° (168), 185° (170), 184–185° (166), 184° (169); note, however, that 4-chloro-2-acetylphenol (5-chloro-2-hydroxyacetophenone) (see below) with Ac_2O + NaOAc at 160–170° for 5 hrs. gives (167) *both* the above 6-chloro-2-methylcoumarin and the isomeric 6-chloro-2-methylchromone, ndls. from AcOH, m.p. 115–116° (167).]

[Note also that C̄ with *α*-alkylacetoacetates + P_2O_5 gives the corresp. chromones: e.g.,

$\bar{C}$ with ethyl α-methylacetoacetate (1:1712) gives (17% yield (171)) 6-chloro-2,3-dimethylchromone, m.p. 107°; $\bar{C}$ with ethyl α-ethylacetoacetate (1:1723) gives (171) 6-chloro-3-ethyl-2-methylchromone, m.p. 109°; $\bar{C}$ with ethyl α-(n-propyl)acetoacetate gives (172) 6-chloro-2-methyl-3-n-propylchromone, m.p. 108°; $\bar{C}$ with ethyl α-isopropylacetoacetate gives (172) 6-chloro-2-methyl-3-n-propylchromone, m.p. 108°; $\bar{C}$ with ethyl α-isopropylacetoacetate gives (172) 6-chloro-3-isopropyl-2-methylchromone, m.p. 127°.]

[$\bar{C}$ with diethyl oxaloacetate + conc. H_2SO_4 at 0° gives (small yield (170)) ethyl 6-chlorocoumarin-4-carboxylate [Beil. XVIII$_1$-(493)], yel. ndls., m.p. 96–97°; $\bar{C}$ with diethyl acetonedicarboxylate (1:1772) + conc. H_2SO_4 gives (6% yield (170)) ethyl 6-chlorocoumarinyl-4-acetate [Beil. XVIII$_1$-(493)], m.p. 167°.]

With diazonium salts. $\bar{C}$ in alk. soln. couples with diazonium salts giving upon acidification the corresp. chloro-hydroxy-azo derivs. [e.g., $\bar{C}$ with benzenediazonium chloride (aniline diazotized in HCl soln.) gives (173) 4-chloro-2-(benzeneazo)phenol (5-chloro-2-hydroxyazobenzene) [Beil. XVI-93], red-or. ndls. from AcOH, mp. 110–111° (173) (174); $\bar{C}$ with diazotized p-nitroaniline gives (175) 4-chloro-2-(p-nitrobenzeneazo)phenol, m.p. 140–143°; for patent on coupling of $\bar{C}$ with other diazonium salts see (176)].

With other miscellaneous reactants. [For condensation of $\bar{C}$ with indene (di)chloride (2,3-dichloroindane) see (177); for condensation of $\bar{C}$ with o-nitrobenzenesulfinic acid (178) or with 2-chloro-5-nitrobenzenesulfinic acid (179) see indic. refs.; for oxidative condensation of $\bar{C}$ with N,N-dialkyl-p-phenylenediamines, etc., to give various indophenols see (180).]

[$\bar{C}$ (2 moles) with SCl_2 (1 mole) in CCl_4 at −10° (181) or in CS_2 at 40–45° (70% yield (182)) or $\bar{C}$ with S_2Cl_2 in CS_2 at room temp. (42% yield (182)) gives bis-(5-chloro-2-hydroxyphenyl) sulfide [Beil. VI$_1$-(396)], ndls. or lfts. from C_6H_6, m.p. 175° (183), 174° (182), 173–174° (184), 173° (181) (corresp. dimethyl ether, m.p. 112° (182); diethyl ether, m.p. 145° (185), dibenzoate, m.p. 145° (182)); for use as disinfectant (181) (183) or in mothproofing compositions (186) see indic. refs.]

[$\bar{C}$ (2 moles) with $SOCl_2$ (1 mole) + $AlCl_3$ in CS_2 gives (70% yield (184)) bis-(5-chloro-2-hydroxyphenyl) sulfoxide [Beil. VI$_1$-(396)], pr. from dil. alc., m.p. 202° (corresp. dinitration prod., m.p. 180–181° (184)).]

Reactions Involving Nuclear Halogen of $\bar{C}$

[$\bar{C}$ on fusion with KOH (187) (188) or $\bar{C}$ with aq. alkali or alk. carbonates in pres. of Cu or Cu compds. at elevated temp under press. (189), or $\bar{C}$ with aq. $Ba(OH)_2$ at 170–195° under press. (190), or $\bar{C}$ with alkali or alk.-earth hydroxides + Cu salts at elevated temp. under press. (191) gives 1,4-dihydroxybenzene (hydroquinone) (1:1590); note, however, that in such fusions with alkali some 1,3-dihydroxybenzene (resorcinol) (1:1530) is also formed (187) (188) (192) (193), and $\bar{C}$ (as Na$\bar{A}$) with NaOH at 310° for 5 hrs. gives (194) as high as 38% resorcinol (1:1530) + a trace of 2,4'-dihydroxybiphenyl; however, $\bar{C}$ on fusion with K_2CO_3 is claimed (193) to yield only hydroquinone (1:1590).]

[$\bar{C}$ with Na_2S + NaOH at 210–215° for 24 hrs. gives (195) 4-mercaptophenol (monothiohydroquinone) [Beil. VI-859, VI$_1$-(419)], m.p. 29–30°.]

[$\bar{C}$ with NH_3 in pres. of Cu cpds. htd. under press. gives (196) p-aminophenol; $\bar{C}$ similarly with prim. aliphatic amines gives (196) corresp N-alkyl-p-aminophenols.]

Reactions of $\bar{C}$ Involving Phenolic H (i.e., H of the OH Group)

Acidic strength. $\bar{C}$ behaves as weak acid, is soluble in aq alk. or in large excess (2.75 moles of 2 N (197)) aq Na_2CO_3 soln. from which it is repptd by CO_2 (197). — Dissoc. const. of $\bar{C}$ in aq. at 28.5° = 6.6×10^{-10} (198); for studies of dissoc. const. in other solutions, e.g., in 50% MeOH at 20° (199) (200) or at 28.5° (198), or at 18° over range 0–95% MeOH by volume (203), in 30% aq. EtOH at 25° (200) (9) (201), or at 18° over range

0–95% EtOH by vol. (202), see indic. refs. — For hydrogen potential of C̄ in 48.95 vol. % EtOH or 95 vol. % EtOH at 20° see (204). — For titration of C̄ with standard NaOH and indicator see (205).

Salts of C̄. [NaĀ; from C̄ in abs. EtOH with equiv. Na, evapd. under H_2, dried at 140–150° (134); very hygroscopic ndls. from conc. alc. soln., turning brown in air; in contrast to Na phenolate is fairly eas. sol. dry ether (206); for behavior with CO_2 at 140–150° giving Na salt of 5-chlorosalicylic acid (3:4705) see (134) (135).]

[C̄ (38.4 pts.) with KOH (5.6 pts.) in C_6H_6 gives (207) KĀ.2C̄.]

[C̄ with $AlCl_3$ evolves heat and HCl giving (208) $Cl.C_6H_4.OAlCl_2$, m.p. 185–187° (208).]

[For patents on use of alkali salts of C̄ as anti-gumming agents for motor fuels see (209); for use of aq. solns. of salts of C̄ as wash liquid for fuel gas purification see (210).]

Etherification (see also below under Ⓓ's)

Aliphatic ethers of C̄. C̄ with alkyl halides usually in presence of an acid acceptor gives the corresponding *p*-chlorophenyl ethers [e g., for *methyl ether* (*p*-chloroanisole) (3:6300) or for *ethyl ether* (*p*-chlorophenetole) (3:0090) see these compds. — *p-Chlorophenyl n-propyl ether* appears to be unreported; for *p-chlorophenyl isopropyl ether*, b.p. 101° at 17 mm. (211), 73–75° at 1.5 mm. (212), n_D^{25} = 1.5127 (212), see indic. refs. — For *p-chlorophenyl isobutyl ether*, b.p. 95–97° at 3 mm., n_D^{25} = 1.5090, see (213); the *n-butyl*, *sec-butyl* and *ter-butyl ethers* are unreported. — For *p-chlorophenyl n-amyl ether*, b.p. 132–133° at 12 mm., *p-chlorophenyl n-hexyl ether*, b.p. 172° at 34 mm., *p-chlorophenyl n-heptyl ether*, b.p. 162° at 14 mm., and *p-chlorophenyl n-hexadecyl ether*, m.p. 48°, see (214)].

[C̄ with vinyl chloride (3:7010) + aq. NaOH + $CuCl_2$ at 170–190° for 10 hrs. under press. gives (215) *p*-chlorophenyl vinyl ether, b.p. 193–194°, D_{-}^{20} = 1.138. — C̄ with allyl bromide + K_2CO_3 in acetone gives (100% yield (216)) *p*-chlorophenyl allyl ether, b.p. 232–234° at ord. press., 106–107° at 12 mm.; note that distn. at ord. press. causes thermal rearr. to 4-chloro-2-allylphenol, b p. 137° at 18 mm., 124–125° at 12 mm., m.p. 48° (corresp. *p*-nitrobenzoate, m.p. 82°) (216). — C̄ with methallyl chloride (3:7145) + K_2CO_3 in acetone gives (217) *p*-chlorophenyl methylallyl ether, b.p. 101.5° at 8 mm., D_{20}^{20} = 1.0979, n_D^{20} = 1.5304; this prod. on thermal rearr. gives (217) 4-chloro-2-methallylphenol, b p. 113° at 8 mm., D_{20}^{20} = 1.145, n_D^{20} = 1.5622, accompanied by some 5-chloro-2,2-dimethylcoumaran, b.p. 96° at 5 mm., D_{20}^{20} = 1.135, n_D^{20} = 1.5300 (217).]

[C̄ with ethylene oxide (1:6105) in alc. NaOEt adds giving (218) cf. (219) ethylene glycol mono-(*p*-chlorophenyl) ether (*p*-chlorophenyl β-hydroxyethyl ether), m.p. about 28° (corresp. *p*-nitrobenzoate, m.p. 90–91°) (218); note that the corresp. ethylene glycol *bis*-(*p*-chlorophenyl ether) is unreported.]

[C̄ (as NaĀ) with 2-chloropropanol-1 (3:7917) gives (220) *p*-chlorophenyl β-hydroxyisopropyl ether (propylene glycol β-(*p*-chlorophenyl) ether), b.p. 151–153° at 18 mm. — C̄ with 3-chloropropanediol-1,2 (glycerol α-monochlorohydrin) (3:9038) *in alk. soln.* (221), or C̄ with glycerol (1:6540) + NaOAc at 200–210° in atmosphere of illuminating gas (222) gives *p*-chlorophenyl β,γ-dihydroxy-*n*-propyl ether (glycerol α-(*p*-chlorophenyl ether), cryst. from C_6H_6, m.p. 80° (221), 76° (222); b.p. 214–215° at 19 mm. (221), 173–175° at 17 mm. (223).]

[C̄ with diethyl chlorofumarate (3:6864) + NaOEt at 150° gives (224) diethyl *p*-chlorophenoxyfumarate, b.p. 199–200° at 12 mm. — C̄ (as NaĀ) + C̄ with ethyl phenylpropiolate as directed gives (224) ethyl β-(*p*-chlorophenoxy)cinnamate, m.p. 63–64°, b.p. 220–225° at 12 mm]

Aromatic ethers of C̄. [illegible] at 19 mm. (225), 146–150° at 7 mm. (226), [illegible] prod. has not been reported by etherification [illegible] (1:7125) in AcOH

with Cl_2 (226), from K phenolate + p-chloroiodobenzene (225), or from p-aminophenol *phenyl ether via diazotization and use of Cu_2Cl_2 reaction (226); for studies of its chlorination*, bromination, iodination, and nitration see (226), for metalation see (227); note also that the product first reported (228) was impure (225).]

p-Chlorophenyl p-chlorophenyl ether (*bis-(p-chlorophenyl) ether*) [m.p. 30° (226) (229), b.p. 168–172° at 7 mm (226); note that this prod has not been reported by etherification of C̄ but has been prepd. from diphenyl ether (1:7125) in AcOH with Cl_2 (226), or from *p*-aminophenol *p*-chlorophenyl ether via diazotization and use of Cu_2Cl_2 reaction (226) (229); for mononitration to 4-chlorophenyl 4-chloro-2-nitrophenyl ether, m.p. 75° (see also below) or dinitration to *bis*-(4-chloro-2-nitrophenyl) ether, m.p. 152° (229), 154° (230), see (229) (230)]

p-Chlorophenyl o-nitrophenyl ether [from C̄ (as KĀ) with *o*-chloronitrobenzene on htg (230) (231) in pres. of Cu bronze (232) (yields· 75% (232), 72% (230)), pale yel. cryst. from MeOH, m.p. 46° (231), 45.5° (230), 44–45° (232), b.p. 220° at 20 mm. (232), 208° at 11 mm. (232); note that this prod does *not* (229) react with piperidine at 100°]

p-Chlorophenyl m-nitrophenyl ether [m.p. 60° (233), reported only by indirect means (233)].

p-Chlorophenyl p-nitrophenyl ether: from C̄ (as KĀ) with *p*-chloronitrobenzene on htg (81% yield (230)) (229) (233), m.p. 76.6° (230), 76° (233), 75.5–76° (229); b.p. 215° at 12 mm. (229) or as one prod of nitration of *p*-chlorophenyl phenyl ether (above) (226) — [For pat. on use as insecticide see (134).]

p-Chlorophenyl 2,4-dinitrophenyl ether: from C̄ (as KĀ (230) or NaĀ (235)) with 2,4-dinitrochlorobenzene on htg (97% yield (230)); yel. tbls. from 1:2 EtOH/AcOH, m.p. 126° (235), 123° (230).

p-Chlorophenyl 2,4,6-trinitrophenyl ether [This prod which should easily be obtd. from C̄ (as KĀ) with 2,4,6-trinitrochlorobenzene (picryl chloride) appears to be unreported.]

p-Chlorophenyl 4-chloro-2-nitrophenyl ether: from C̄ (as KĀ) with 2,5-dichloronitrobenzene on htg. (84.4% yield (230)) (229) (231) (84), pale yel ndls from alc., m.p. 79° (230), 78° (231), 75° (229); b.p. 215–220° at 15 mm (229)

p-Chlorophenyl 4-bromo-2-nitrophenyl ether: from C̄ (as KĀ) with 2,5-dibromonitrobenzene on htg. (91.0% yield (230)) (236), pale yel ndls. from AcOH, m.p. 100–101° (236), 100.5° (230).

Esterification

Esters of inorganic acids. [C̄ with $SOCl_2$ + pyridine in C_6H_6 as directed gives (237) (238) *bis*-(*p*-chlorophenyl) sulfite, b.p. 213–214° at 12 mm., sl. dec.]

[C̄ (3 moles) with PCl_3 (1 mole) at 150° gives (239) *tris*-(*p*-chlorophenyl) phosphite, m.p. 49°, b.p. 296–297° at 15 mm. (corresp. MeI addn. prod., m.p. 71° (239)), note, however, that C̄ with large excess PCl_3 at 100° gives (240) *p*-chlorophenylphosphorous dichloride $Cl.C_6H_4.OPCl_2$, b.p. 128–130° at 12 mm., and di-(*p*-chlorophenyl)phosphorous chloride $(Cl.C_6H_4.O)_2{=}P{-}Cl$, b.p. 225–227° at 11 mm.]

[C̄ (3 moles) with $POCl_3$ (1 mole) under reflux (241), or C̄ with $POCl_3$ in cold alk. soln. (242) (243), or C̄ (as NaĀ) with $POCl_3$ in neutral inert solv. (244), gives tri-(*p*-chlorophenyl) phosphate [Beil. VI-188, VI_1-(102)], m.p. 117° (241), 112° (244) — Note, however, that C̄ with $POCl_3$ in pres. of Mg at 130–140° gives (245) *p*-chlorophenylphosphoryl dichloride, $Cl.C_6H_4.O{-}P(O)Cl_2$ [Beil. VI-188, VI_1-(102)], b.p. 265° at 760 mm. (246) (247), 141° at 12 mm. (246), 95–115° at 0.1 mm. (245), accompanied by di-(*p*-chlorophenyl)-phosphoryl chloride $(Cl.C_6H_4.O)_2P(O)Cl$ [Beil. VI-188], b.p. 164–176° at 0.1 mm. (245); these two products may be hydrolyzed, respectively, to *p*-chlorophenylphosphoric acid [Beil. VI-188] cf. (248), m.p. 80–81° (249), and di-(*p*-chlorophenyl)phosphoric acid [Beil. VI-188], m.p. 126–127° (242), 133–135° cor. (248) (250).]

[For analogous behavior of C̄ with $TiCl_4$ see (251).]

Esters of aliphatic organic acids (see also below under Ⓓ's).

p-Chlorophenyl acetate: from C̄ with Ac_2O + NaOAc (252); m.p. 7–8° (252), b.p. 226–228° (253), 100–102° at 15 mm. (254), 108° at 12.5 mm. (252), 90–92° at 2.5 mm. (61), D_4^{20} = 1.2248 (252). — Note that this prod. with $AlCl_3$ on htg. (255) (254) (61) or C̄ with AcCl + $FeCl_3$ directly (256) gives (100% yield (255)) 4-chloro-2-acetylphenol (5-chloro-2-hydroxyacetophenone) [Beil. VIII-86], m.p. 55° (256), 54° (61), 53.5–54.5° (167), b.p. 97–99° at 2 mm. (61) (corresp. acetate, b.p. 156–157° (140)).

p-Chlorophenyl propionate: from C̄ with propionyl chloride (3:7170) (140) (61); oil, b.p. 234–236° (140), 76–78° at 2 mm. (61). — Note that this prod. with $AlCl_3$ undergoes Fries rearr. giving (140) (61) 4-chloro-2-propionylphenol (5-chloro-2-hydroxypropiophenone), m p. 59.7° (61), 56.5–57.5° (140) (corresp. methyl ether, m.p. 41–42°, b.p. 135–140° at 6 mm. (257)).

p-Chlorophenyl n-butyrate: from C̄ with *n*-butyryl chloride (3:7370) (140) (61); oil, b.p. 249–251° (140), 96–98° at 3 mm. (61). — Note that this prod. with $AlCl_3$ undergoes Fries rearr. giving (140) (61) 4-chloro-2-(*n*-butyryl)phenol (5-chloro-2-hydroxy-*n*-butyrophenone), m.p. 50.5° (61), 49–50° (140); b.p. 108–112° at 3 mm. (61).

p-Chlorophenyl isobutyrate: from C̄ with isobutyric acid (1:1030) + $POCl_3$ (258); m p. 29°, b.p. 120° at 11 mm. (258). — Note that this prod. with $AlCl_3$ undergoes Fries rearr. giving (258) 4-chloro-2-isobutyrylphenol (5-chloro-2-hydroxy-isobutyrophenone), oil, b.p. 130° at 20 mm., D_4^{20} = 1.192, n_{He}^{20} = 1.5521 (258).

[For generally analogous behavior of C̄ with *n*-valeryl chloride (3:7740), *n*-caproyl chloride (3:8168), *n*-heptanoyl chloride (3:8520), *n*-octanoyl chloride (3:8680) see (61); with chloroacetyl chloride (3:5235) see (259); with α-bromo-isovaleryl bromide see (260).]

C̄ (as NaĀ) (2 moles) with $COCl_2$ (3:5000) in C_6H_6 at 130–180° under press. (261) or C̄ (as KĀ) in conc. aq. soln. with $COCl_2$ in toluene (262), or C̄ with trichloromethyl chloroformate (diphsogene) (3:5515) + aq. NaOH (263), gives di-(*p*-chlorophenyl) carbonate [Beil. VI-187], m.p. 147° (263), 144–145° (264).

Esters of aromatic organic acids (see also below under Ⓓ's).

p-Chlorophenyl benzoate: from C̄ with benzoyl chloride (3:6240) (265) (for study of rate at 25° see (268)) in pres. of aq. NaOH (252) (266) (267); m.p. 87–87.5° (138), 87° u.c. (252), 86° (266) (267) — Note that this prod. with $AlCl_3$ undergoes Fries rearr. giving (140) 4-chloro-2-benzoylphenol (5-chloro-2-hydroxybenzophenone), m.p. 95.0–95.5° (138), 94–95° (139), 94° (137), 93–94° (140) (corresp. benzoate, m.p. 112° (139)).

p-Chlorophenyl cinnamate: from C̄ with cinnamoyl chloride (3:0330) (68% yield (260)), m.p. 105° (260) (269).

—— **_p_-Chlorophenyl methyl ether (_p_-chloroanisole):** oil. (See 3:6300.)

—— **_p_-Chlorophenyl ethyl ether (_p_-chlorophenetole):** m.p. 20–21°. (See 3:0090.)

—— **_p_-Chlorophenyl acetate:** m p. 7–8° (252). [For further details see above under esters of C̄ with aliphatic organic acids.]

Ⓓ **_p_-Chlorophenyl benzoate:** m.p. 87.0–87.5° (138), 87° u.c. (252), 86° (266) (267) [From C̄ with benzoyl chloride in pres. of aq. NaOH (252) (266) (267) (see also above under esters of C̄ with aromatic organic acids).]

—— **_p_-Chlorophenyl _o_-nitrobenzoate:** unreported.

Ⓓ **_p_-Chlorophenyl _m_-nitrobenzoate:** m.p. 124.5° (252). [From C̄ with *m*-nitrobenzoyl chloride + aq. NaOH (252).]

Ⓓ **_p_-Chlorophenyl _p_-nitrobenzoate:** m.p. 171° (270).

Ⓓ **_p_-Chlorophenyl 3,5-dinitrobenzoate:** m.p. 186° (271).

—— **_p_-Chlorophenyl benzenesulfonate:** unreported.

—— *p*-Chlorophenyl *p*-toluenesulfonate: unreported.

Ⓓ *p*-Chlorophenyl benzyl ether: ndls. from alc., m.p. 71° (272), 70–71° (273). [Note, however, that C̄ with benzyl chloride (3:8535) + $AlCl_3$ gives not only this prod. but also (273) cf. (274) some Fries rearr. prod., viz., 4-chloro-2-benzylphenol (5-chloro-2-hydroxydiphenylmethane), m p 48–49° (273), 48.5° (274) (corresp. benzoate, m.p. 54–55°, benzenesulfonate, m.p. 68–69°, *p*-toluenesulfonate, m.p. 75 0–75 5° (273)).]

Ⓓ *p*-Chlorophenyl *p*-nitrobenzyl ether: cryst. from alc., m.p. 101.3° (275). [From C̄ + *p*-nitrobenzyl chloride (m p. 71°) (or *p*-nitrobenzyl bromide, m.p. 99°) in alc. NaOEt (275).]

Ⓓ *p*-Chlorophenyl 2,4-dinitrophenyl ether: yel. tbls. from 1:2 EtOH/AcOH, m p. 126° (235), 123° (230). [From C̄ (as KĀ (230) or NaĀ (235)) with 2,4-dinitrochlorobenzene (m.p. 51°) on htg (97% yield (230))]

Ⓓ *p*-Chlorophenoxyacetic acid (3:4375): pr. from hot aq., m.p. 156.7–157 2° cor. (279), 155–156 5° u.c. (276), 155–156° (277), 154–155° (278). [From C̄ with chloroacetic acid in aq alk (279) (276) (277) (278)]

—— *p*-Chlorophenyl *N*-phenylcarbamate: cryst. from alc., m p. 138° (280), 137–138° (263). [From C̄ (as NaĀ) with phenylisocyanide dichloride on htg. (280); note, however, prepn. from C̄ + phenyl isocyanate has *not* been reported.

Ⓓ *p*-Chlorophenyl *N*-(*p*-bromophenyl)carbamate: white pl. from C_6H_6/EtOAc, m.p 196–197° cor. (281). [From C̄ with *p*-bromobenzazide (281) in lgr. (281).]

Ⓓ *p*-Chlorophenyl *N*-(*p*-iodophenyl)carbamate: m p. 214–215° (282). [From C̄ with *p*-iodobenzazide (282) in lgr (282)]

Ⓓ *p*-Chlorophenyl *N*-(*m*-nitrophenyl)carbamate: white pl. from lgr , m p. 136° u.c., 139° cor. (283). [From C̄ with *m*-nitrobenzazide (283) or *m*-nitrophenyl isocyanate (283) in lgr. (283)]

Ⓓ *p*-Chlorophenyl *N*-(*p*-nitrophenyl)carbamate: pale yel. rods from lgr., m.p. 196° cor. (284). [From C̄ with *p*-nitrobenzazide (284) in lgr. (284).]

Ⓓ *p*-Chlorophenyl *N*-(3,5-dinitrophenyl)carbamate: yel pl. from C_6H_6/EtOAc, m.p. 197–198° (285). [From C̄ with 3,5-dinitrobenzazide (285) in lgr. (285).]

Ⓓ *p*-Chlorophenyl *N*-(3,5-dinitro-4-methylphenyl)carbamate: pale yel. pl. from lgr., m.p. 206–207° u.c., 212–213° cor (286) [From C̄ with 3,5-dinitro-4-methylbenzazide (286) in lgr. (286)]

Ⓓ *p*-Chlorophenyl *N*-(α-naphthyl)carbamate: m p. 165–166° (287). [From C̄ with α-naphthyl isocyanate in lgr (287).]

Ⓓ *p*-Chlorophenyl *N*-(β-naphthyl)carbamate: pl. from lgr , m p 165–166° u.c., 169–170° cor (288) [From C̄ with β-naphthyl isocyanate (288) in lgr. (288).]

Ⓓ *p*-Chlorophenyl *N*,*N*-diphenylcarbamate: m.p. 97° (289) [From C̄ with *N*,*N*-diphenylcarbamyl chloride (289)]

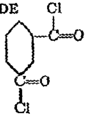
CHAPTER III

DIVISION A. SOLIDS

(3:0500–3:0999)

3:0520 ISOPHTHALYL (DI)CHLORIDE $C_8H_4O_2Cl_2$ Beil. IX - 834
(Isophthaloyl dichloride) IX_1-(372)



M.P.		B.P.			
43–44°	(1)	276°		(3)	$D_4^{46.9} = 1.3872$ (9)
42–43°	(2)	200° (?)	at 15 mm.	(7)	$n_D^{46.9} = 1.56999$ (9)
41–43°	(18)	156°	at 15 mm.	(8)	
41°	(3) (4)	142.6–143°	at 14 mm.	(5)	
40.5–41°	(5)	143–144°	at 13 mm.	(2)	
40°	(6)	136°	at 11 mm.	(18)	

Prisms from pet. ether.

[For prepn. of $\bar{C}$ from isophthalic acid (1:0900) with PCl_5 (3) in a s.t. at 200° (10) or in $POCl_3$ (8) see indic. refs.; with AcCl (3:7065) in s.t. at 130° for 8 hrs. see (1); with $SOCl_2$ (yield: 100% (6), 92% (18), 67% (2), 62% (7)) (5) see indic. refs.; for prepn. of $\bar{C}$ from 1,3-*bis*-(trichloromethyl)benzene by partial catalytic hydrolysis see (4) (17).]

$\bar{C}$ with excess MeOH yields (11) dimethyl isophthalate (1:2214), m.p. 67–68°; cf. also under isophthalic acid (1:0900); $\bar{C}$ with excess phenol yields (3) diphenyl isophthalate, m.p. 120° (3).

[*$\bar{C}$ on cat. hydrogenation in xylene with Pd cat. as specified (12) gives 83% yield isophthalaldehyde* [Beil. VII-675, VII_1-(364)], cryst. from alc., m.p. 88–89° (12) (dioxime, m.p. 178°; *bis*-phenylhydrazone, m.p. 242–244° (12)).]

[$\bar{C}$ with $AlCl_3$ + benzene yields (13) 1,3-dibenzoylbenzene (isophthalophenone) [Beil. VII-829, VII_1-(443)], m.p. 100–101° (dioxime, m.p. 70–75° (10)); for corresp. reactn. of $\bar{C}$ with *m*-xylene (1:7420) see (14); for corresp. reactn. of $\bar{C}$ with anisole (1:7445) see (15).]

[For reactns. of $\bar{C}$ with ethyl sodio-acetoacetate see (8) and with ethyl sodio-cyanoacetate see (16).] [For behavior of $\bar{C}$ with diazomethane see (18).]

$\bar{C}$ on hydrolysis yields isophthalic acid (1:0900) q.v. for further characterization.

3:0525 16-CHLOROHEXADECANOL-1 $C_{16}H_{33}OCl$ Beil. S.N. 24
(ω-Chloro-*n*-hexadecyl alcohol; ω-Chloropalmityl alcohol)

$CH_2—(CH_2)_{14}.CH_2OH$
|
Cl

M.P. 43° (1)

Colorless cryst. from lt. pet.

[For prepn. of C̄ from α,ω-hexadecamethylene glycol [Beil. I_2-(565)] (m.p. 87–88° (1)) with $SOCl_2$ + dimethylaniline in C_6H_6 (60% yield) see (1); note that a little 1,16-dichlorohexadecane, cryst. from MeOH, m.p. 47°, is also formed.]

3:0525 (1) Bennett, Gudgeon, *J. Chem. Soc.* **1938**, 1679–1681.

3:0535 METHYL *p*-CHLOROBENZOATE $C_8H_7O_2Cl$ Beil. IX - 340
IX_1—

M.P. 44° (1)
43–43.5° (2) (6)
43° (3) (4)
42° (5)
34° (9)

[For prepn. of C̄ from *p*-chlorobenzoic acid (3:4940) with MeOH + HCl (2) or MeOH + H_2SO_4 (2) (6) see indic. refs.; from AgĀ + MeI in s.t. at 100° see (5); from *p*-chlorobenzoyl chloride (3:6550) with MeOH see (3).]

C̄ on htg. with sirupy H_3PO_4 at 200° yields (7) *p*-chlorobenzoic acid (3:4940), dimethyl ether, and probably some *p*-chlorotoluene (3:8287).

C̄ added to 5–6 pts. very conc. HNO_3 at 0°, poured onto ice, yields (3) methyl 4-chloro-3-nitrobenzoate [Beil. IX-402], cryst. from MeOH, m.p. 83° (3).

[C̄ with Na + methyl acetate condenses giving (60% yield (6)) methyl *p*-chlorobenzoylacetate, b.p. 172° at 12 mm., m.p. 36–37° (6); this prod. with excess phenylhydrazine in alc. + AcOH gives on htg. 3-(*p*-chlorophenyl)-1-phenylpyrazolone-5, cr. cryst. from AcOH, m.p. 140° (6); corresp. prod. from *p*-nitrophenylhydrazine, m.p. 200–205° (6).]

C̄ on hydrolysis (Sap. Eq. = 170.5) yields methyl alcohol (1:6120) + *p*-chlorobenzoic acid (3:4940). [For studies of hydrolysis under various cond. see (2) (4).] — For the amide, anilide, *p*-toluidide, and other derivs. corresp. to C̄ see *p*-chlorobenzoic acid (3:4940).

3:0550 3,4-DICHLOROBENZALDEHYDE $C_7H_4OCl_2$ Beil. VII - 238
VII_1-(134)

M.P. 44° (1) **B.P. 247–248° (2)**
43–44° (2)
42.0–42.6° (3)

Colorless ndls. from alc. (1), odor like benzaldehyde (2). — Eas. volatile with steam (2) (3).

[For prepn. of C̄ from 3,4-dichlorotoluene (3:6355) via chlorination to 3,4-dichlorobenzal

(di)chloride (3:6876) and hydrolysis of the latter with fumg. H_2SO_4 (5% SO_3) (36% yield (3)), conc. H_2SO_4 (4), or $CaCO_3 + H_2O$ (40% yield (3)) see (2) (3) (4); for prepn. from 4-chloro-3-nitrobenzaldehyde via reduction, diazotization, etc., see (1).]

C̄ with satd. aq. $NaHSO_3$ yields a cpd C̄.$NaHSO_3$ (3). [Use in purification of C̄ (3).]

C̄ on oxidn. with $KMnO_4$ yields (2) 3,4-dichlorobenzoic acid (3:4925), m.p. 201–202° (3). — C̄ with conc. aq. KOH undergoes Cannizzaro reactn. yielding 3,4-dichlorobenzyl alcohol, ndls. from aq., m.p. 38° (3), and 3,4-dichlorobenzoic acid (see above).

C̄ on nitration as specified (5) (4) gives (71% yield (4)) 3,4-dichloro-6-nitrobenzaldehyde [Beil. VII₁-(144)], yel. pr. from C_6H_6, m.p. 73° (5). [This product with $NH_4OH/AgNO_3$ *is oxidized (4) to 3,4-dichloro-6-nitrobenzoic acid, cryst. from* C_6H_6, *m.p. 165° (6).*]

[For conversion of C̄ to 3,4-dichlorostyrene (7) (8) cf. (9) via reaction with MeMgI giving (73% yield (7)) 3,4-dichlorophenyl-methyl-carbinol (7) (8) and dehydration of latter with $KHSO_4$ (yields 83% (8), 64% (7)) see indic. refs.]

(D) **3,4-Dichlorobenzaldoxime** (*anti* form): m.p. 114–115° (2), 118–119° (1). [The *syn* isomer, ndls. from alc., m.p. 120° rap. htg., is converted by fusion (2) to the *anti* form.]

—— **3,4-Dichlorobenzaldehyde phenylhydrazone:** unrecorded.

(D) **3,4-Dichlorobenzaldehyde *p*-nitrophenylhydrazone:** or. ndls., m.p. 276–277° (1).

—— **3,4-Dichlorobenzaldehyde 2,4-dinitrophenylhydrazone:** unrecorded.

—— **3,4-Dichlorobenzaldehyde semicarbazone:** unrecorded.

43°	(3) (4)	209–210°	(4)	
	(16) (18)	206–208° u.c. at 753 mm.	(7)	
42°	(5)	106.2–107.6° at 14–16 mm.	(3)	
41–42°	(11)			

Colorless ndls. from C_6H_6. — C̄ has unpleasant and persistent odor suggesting iodoform (1) (for study of strength of odor of aq. solns. of C̄ see (1)). — C̄ is spar. sol. aq. (100 g. aq. at 20° dis. 0.45 g. C̄), but is eas. sol. alc., ether, C_6H_6, or $CHCl_3$. — C̄ is volatile with steam; *note, however, that from alk. soln. C̄ is not volatile with steam* (dif. and sepn. from 2-chlorophenol (3:5980) or 4-chlorophenol (3:0475) (9)), although C̄ is volatile with steam from aq. solns. contg. $PbCO_3$ (dif. and sepn. of C̄ from 2,4,6-trichlorophenol (3:1673) (9)). — Note that comml. C̄ often contains 2,4,6-trichlorophenol, and that C̄ prepd. by chlorination of phenol may cont. 2,6-dichlorophenol (3:1595).

[For prepn. of C̄ from *p*-chlorophenol (3:0475) or *o*-chlorophenol (3:5980) with Cl_2 (1 mole) in AcOH soln. (80% yield) see (6); from phenol (1:1420) with Cl_2 (2 moles) diluted with CO_2 in AcOH and under these cond. giving exclusively C̄ see (7).]

[For formn. of $\bar{C}$ (together with other prods.) from phenol (1:1420) with Cl_2 (2 moles) (2) (1) (4) (10), with Cl_2 (2 moles) in alk. soln. (11) (12), with *N,N'*-dichlorourea in HCl soln. (13), or with SO_2Cl_2 (14) see indic. refs.; for formn. of $\bar{C}$ from salicylic acid (1:0780) in excess aq. KOH with Cl_2 see (15); from 3,5-dichloro-2-hydroxybenzoic acid (3,5-dichlorosalicylic acid) (3:4935) on distn. with lime see (16) (17); from 2,6-dichloro-3-hydroxybenzaldehyde (3:4160) in excess 50% aq. KOH on htg. at 80° (94% yield) see (5).]

Nuclear substitution of $\bar{C}$. $\bar{C}$ in AcOH with Br_2 (1 mole) (7) (18), or in 50% AcOH with Br_2 (1 mole) in AcOH (19), yields 6-bromo-2,4-dichlorophenol, ndls. from C_6H_6 or lt. pet., m.p. 68–69° (19), 68° (7) (18), b.p. 268° dec. (18), 204° at 19 mm. (19), 198° at 15 mm. (19), 192° at 12 mm. (19) (corresp. methyl ether, m.p. 65° (7); corresp. 2,4-dinitrophenyl ether, yel. lfts. from alc., m.p. 140–141° (19); corresp. *p*-toluenesulfonate, m.p. 82–83° (19)). — [This 6-bromo-2,4-dichlorophenol with excess Br_2 in pres. of Fe powder and absence of aq. yields (20) 2,4-dichloro-3,5,6-tribromophenol, cryst. from AcOH, m.p. 209° (20) (corresp. methyl ether, m.p. 143–144° (20), corresp. benzoate, m.p. 202° (20)).]

$\bar{C}$ in aq. NaOH with I_2 (1 mole) in aq. KI yields (7) 2,4-dichloro-6-iodophenol, ndls. from dil. alc , m.p. 63° (7) (corresp. methyl ether, m.p. 35°, b.p. 278–285° u.c. (7)).

$\bar{C}$ on nitration by soln. in cold fumg. HNO_3, subsequently poured into aq. (4) cf. (21), yields 2,4-dichloro-6-nitrophenol [Beil. VI-241, VI_1-(122)], yel. cryst. from alc., m.p. 121–122° (4), 124° (22).

Condensation reactions involving nuclear hydrogens. [$\bar{C}$ with formalin (1:0145) + conc. HCl + conc. H_2SO_4 in pres. of stream of HCl gas at 35–40° (23), or $\bar{C}$ with trioxymethylene + $AcOH/H_2SO_4$ at 50° (24), gives (54% yield (23)) 6,8-dichlorobenzodioxane-1,3, volatile with steam, cryst. from MeOH, m.p. 111° (24), 109–109.5° (23). — $\bar{C}$ with formalin (1:0145) + conc. HCl in stream of HCl gas at 50° for 36 hrs. gives (72% yield (23)) 3,5-dichloro-2-hydroxybenzyl chloride, ndls. from pet. eth., m.p. 82–84° (23); this prod. on hydrol. with aq. at 50° yields (23) 3,5-dichloro-2-hydroxybenzyl alc., ndls. from aq , m.p. 80–81°, also formed as by-product of the dichlorobenzodioxane mentioned above.]

[$\bar{C}$ with methylal (1·0105), methylene diacetate, or methylene (di)iodide in pres. of conc. H_2SO_4 or $ZnCl_2$ (25) or $\bar{C}$ + formalin (1:0145) with $AcOH/H_2SO_4$ (26) yields methylene-*bis*-(2,4-dichlorophenol) (2,2'-dihydroxy-3,5,3',5'-tetrachlorodiphenylmethane); for use of this prod. as mothproofing cpd., antiseptic, and seed disinfectant see (25) (26) (27) (28) (29) (30). — Note, however, that $\bar{C}$ (as Na salt) with methylene (di)chloride (3:5020) at 120–140° in s.t. for 6 hrs. gives (24) *bis*-(2,4-dichlorophenoxy)methane, m.p. 98°. — $\bar{C}$ with SCl_2 or S_2Cl_2 + $AlCl_3$ in CS_2 or CCl_4 yields (31) 2,2'-dihydroxy-3,5,3',5'-tetrachlorodiphenyl sulfide, m.p. 188°. — For condens. of $\bar{C}$ with benzaldehyde *o*- (or *p*-) sulfonic acids and use of products as mothproofing agts. see e.g. (26).]

[$\bar{C}$ with phthalic anhydride (1:0725) + $AlCl_3$ at 150° for 2 hrs. yields (36) cf. (37) (38) 2-(3',5'-dichloro-2'-hydroxybenzoyl)benzoic acid, colorless lfts. from alc., m.p. 204° cor. (36), which with conc. H_2SO_4 ring-closes to 2,4-dichloro-1-hydroxyanthraquinone, yel. ndls. from C_6H_6, m.p. 242° (36), 241–242° (39). — $\bar{C}$ with 4,5-dichlorophthalic anhydride (3:4830) + fumg. H_2SO_4 + H_3BO_3 at 195° yields (40) 2,6,7-trichloro-1,4-dihydroxyanthraquinone (2,6,7-trichloroquinizarin).]

Reactions of the phenolic group of $\bar{C}$ (see also under Ⓓ below). $\bar{C}$ behaves as a weak acid: $\bar{C}$ is sol. in aq. alk. but largely pptd. by CO_2. — Dissoc. const. at 25° in aq. is $31. \times 10^{-7}$ (41) cf. (42).

[For study of bactericidal prop. of $\bar{C}$ see (43); for use as insecticide in paper see (44); for prepn. and use of metal complexes as antiseptics see (45).]

[$\bar{C}$ with alkali metals gives corresp. alk. 2,4-dichlorophenolates: K 2,4-dichlorophenolate with CO_2 at 140° yields (15) 3,5-dichloro-2-hydroxybenzoic acid (3,5-dichlorosalicylic acid) (3:4935).]

[C̄ with ethyl α-methylacetoacetate (1:1712) + P_2O_5 gives (14.5% yield (46)) 6,8-dichloro-2,3-dimethylchromone [Beil. XVII₁-(177)], ndls. from alc., m p. 141°.]

[C̄ in 20% aq. KOH htd. 2 hrs. at 100° with Me_2SO_4 (22) cf. (1) yields 2,4-dichlorophenyl methyl ether (2,4-dichloroanisole) [Beil. VI-189, VI_1-(103)], b.p. 232–233° cor. at 743 5 mm.; m.p. 27–28° (47). — C̄ with EtI + K_2CO_3 in acetone refluxed 6–8 hrs. gives (90% yield (48)) 2,4-dichlorophenyl ethyl ether (2,4-dichlorophenetole), oil, b.p. 235–236° (48), 236–237° (4) (for study of cleavage of this ether with HBr/AcOH see (48), for study of rate of formation see (49)). — C̄ with allyl bromide + K_2CO_3 in acetone yields (50) allyl 2,4-dichlorophenyl ether, b p. 144–145° at 25 mm. (50).]

—— **2,4-Dichlorophenyl acetate**: oil, b.p. 244–245° (4), 167–168° at 80 mm. (51). [From C̄ with AcCl refluxed 40 min. (86% yield (51)), this ester with $AlCl_3$ at 170° for 40 min. undergoes Fries rearr. giving (75% yield (51)) 3,5-dichloro-2-hydroxyacetophenone, m.p 95–96° (51).]

Ⓓ **2 4-Dichlorophenyl benzoate**: cryst from alc., m.p. 96.5° (5), 96° (1), 97° [Beil. IX-117]. [From C̄ in dil. aq NaOH shaken with BzCl (5) cf. (1)] [For study of nitration of this ester see (6).]

Ⓓ **2,4-Dichlorophenyl *m*-nitrobenzoate**: ndls. from alc., m p. *115–116°* (6). [From C̄ + *m*-nitrobenzoyl chloride in dil. aq. alk.; for study of its nitration see (6).]

—— **2,4-Dichlorophenyl *p*-nitrobenzoate**: unreported.

—— **2,4-Dichlorophenyl 3,5-dinitrobenzoate**: unreported.

—— **2,4-Dichlorophenyl benzenesulfonate**: unreported.

• Ⓓ **2,4-Dichlorophenyl *p*-toluenesulfonate**: pr. from alc., m p. 125° (6).

Ⓓ **2,4-Dichlorophenyl benzyl ether**: pr. from alc., ether, or pet. eth , m p 62° (52), 61–62° (53), 60° (54), 59.0–59.5° (55). [From C̄ + benzyl chloride (3:8535) + NaOEt in hot alc. (53), or from Na salt of C̄ + benzyl chloride in MeOH (55); note, however, that Na salt of C̄ with benzyl chloride in toluene at 160° for 5 hrs. undergoes instead nuclear alkylation yielding (55) 2,4-dichloro-6-benzylphenol (3,5-dichloro-2-hydroxydiphenylmethane), cryst. from pet. eth., m p 77.0–77.5° (55)]

Ⓓ **2,4-Dichlorophenyl *p*-nitrobenzyl ether**: ndls. from ether, m p. 148–150° (53).

Ⓓ **2,4-Dichlorophenyl 2,4-dinitrophenyl ether**: lfts from AcOH, AcOH/EtOH, or EtOH, m.p. 119° (56), 118–119° (6), 118° (57). [From Na or K salt of C̄ + 2,4-dinitrochlorobenzene refluxed in alc. (56) (6) (57).]

Ⓓ **2,4-Dichlorophenoxyacetic acid (3:4095)**: cryst. from C_6H_6, m p. 138° (58), Neut. Eq. = 221 0. [From C̄ + chloroacetic acid in slight excess aq. NaOH, refluxed and then acidified (87% yield (58)); for studies on use of this prod. as plant hormone see (59).]

—— **2,4-Dichlorophenyl *N*-phenylcarbamate**: unreported.

Ⓓ **2,4-Dichlorophenyl *N*(*p*-iodophenyl)carbamate**: m p. 182–183° (61). [From C̄ + *p*-iodobenzazide in hot lgr (61).]

Ⓓ **2,4-Dichlorophenyl *N*-(*p*-bromophenyl)carbamate**: rods from lgr /AcOEt, m p. 169° cor (62) [From C̄ + *p*-bromobenzazide in hot lgr. (62)]

Ⓓ **2,4-Dichlorophenyl *N*-(*p*-nitrophenyl)carbamate**: yel. pl. from lgr./EtOAc, m.p. 205° cor. (62). [From C̄ + *p*-nitrobenzazide in hot lgr. (63).]

Ⓓ **2,4-Dichlorophenyl *N*-(3,5-dinitro-4-methylphenyl)carbamate**: or.-yel. pr. from lgr. or EtOAc, m.p 153° u c., 157° cor. (64). [From C̄ + 3,5-dinitro-4-methylbenzazide in hot lgr (64).]

—— **2,4-Dichlorophenyl *N*-(α-naphthyl)carbamate**: unreported.

Ⓓ **2,4-Dichlorophenyl *N*-(β-naphthyl)carbamate**: pl. from lgr., m p. 162° u c., 166° cor. (65). [From C̄ + β-naphthyl isocyanate (or azide) in hot lgr. (65)]

similarly. — C̄ (1 mole) with salicylic acid (1:0780) in pyridine at −15° (52) or in C_6H_6 with dimethylaniline (63% yield (52)) gives *O*-carbethoxysalicylic acid [Beil. X-69, X_1-(30)], m.p. 95° (other mono-, di-, and polyhydroxy phenolic acids behave similarly); since the carbethoxy groups so introduced may subsequently be removed by hydrolysis, this process has great value as a means of temporary blocking of phenolic groups (for further discussion and many references see (53)).]

[C̄ also reacts with the sodio derivatives and other metallic enolates: e.g., C̄ (1 mole) with ethyl cyanoacetate (2 moles) in abs. alc. + NaOEt (2 moles) gives (54) diethyl cyanomalonate [Beil. II-811, II_1-(321), II_2-(680)], b.p. 138–140° at 14 mm., D_4^{20} = 1.1128, n_D^{20} = 1.4295 (55). — C̄ with diethyl malonate (1:3581) + NaOEt in alc. (56) or C̄ with dry diethyl sodio-malonate (57) directly (58) (59) or in C_6H_6 refluxed for 10 hrs. (60) gives (yields: 50–80% (59), 60–65% (60)) triethyl methane-tricarboxylate (tricarbethoxymethane) [Beil. II-810, II_1-(320), II_2-(680)], m.p. 29°, b.p. 253°; note that this same prod. is also obtained (yields: 88–93% (61), 90% (62), 80% (63)) from C̄ with diethyl malonate (1:3581) in abs. alc. with Mg + trace CCl_4. — C̄ with the Na enolate of ethyl isobutyrate (1:3095) gives (75% yield (64)) diethyl dimethylmalonate [Beil. II-648, II_1-(276), II_2-(572)], b.p. 195–196° at 760 mm. — The reactn. of C̄ with ethyl sodioacetoacetate cannot be discussed here.]

[C̄ with excess RMgX compounds presumably gives first the corresp. esters which by further normal reactn. with more RMgX are converted to tertiary alcohols: e.g., C̄ with EtMgBr (excess) yields (65) triethylcarbinol (1:6218); however, the intermediate ester can often readily be obtd.; e.g., C̄ (1 mole) with *ter*-BuMgCl (1 mole) in dry ether gives (56% yield (66)) ethyl trimethylacetate (ethyl pivalate (1:3117), and other cases are recorded (66); note, however, that with certain types of RMgX cpd. abnormal reactions can occur: e.g., C̄ with benzyl MgCl yields not only the normal tribenzylcarbinol but also (67) ethyl *o*-toluate (1:3862). — C̄ also reacts with the =N—MgX grouping replacing —MgX by —COOEt (sometimes followed by rearrangement): e.g., C̄ + 3,5-dimethylpyrrole-*N*-(magnesyl bromide) gives (57–58% yield (68)) 5-carbethoxy-2,4-dimethylpyrrole.]

C̄ also reacts readily with NH_3, with primary and secondary amines, with amino acids, etc., to replace one of the H's attached to N by the —COOEt group (see also below and under Ⓓ): e.g., C̄ with excess conc. aq. NH_4OH immediately (if delayed, urea is formed) evaporated to dryness gives (3) ethyl carbamate (urethane) [Beil. III-22, III_1-(9), III_2-(19)], very eas. sol. aq., cryst. from abs. alc., dry ether, $CHCl_3$, or C_6H_6, m.p. 48°, b.p. 184°. — [C̄ (1 mole) in ether with 33% aq. $MeNH_2$ soln. (1 mole) + aq. NaOH below 5° as directed (69) gives (88–90% yield (69)) (70) (71) ethyl *N*-methylcarbamate [Beil. IV-64, IV_1-(330), IV_2-(567)], oil, very sol. aq. (69 g. in 100 ml. aq. at 15.5° (72)), b.p.170°. — Countless other, analogous reactns. cannot be cited here.]

[C̄ with hydroxylamine hydrochloride + conc. aq. Na_2CO_3 (73) or with dry K_2CO_3 in ether (74) gives (89.6% yield (74)) *N*-hydroxyurethane (carbethoxyhydroxamic acid) [Beil. III-95, III_2-(77)], oil, very sol. aq.]

C̄ with hydrazine hydrate in alc. refluxed ½ hr. (75) (for starting with hydrazine sulfate see (76)) gives (yields: 100% (76), 90% (75)) diethyl *sym.*-hydrazinedicarboxylate (*sym.*-dicarbethoxyhydrazine) [Beil. III-98, III_1-(46), III_2-(79)], cryst. from hot aq., ndls. from $CHCl_3$, m.p. 130° (75), 131° (76) (note that the half reaction product, viz., ethyl hydrazinemonocarboxylate (*N*-aminourethane) (ethyl carbazinate), is also known (77) (78) but is an oil. — C̄ (1 mole) with urea (2.1 moles) refluxed for 2–3 hrs. gives (62–65% yield (79)) ethyl allophanate (*N*-carbethoxyurea) [Beil. III-69, III_1-(31), III_2-(56)], m.p. 192°.

C̄ (1 mole) in ether with phenylhydrazine (2 moles) in ether (80) (81) (82) (76) or in aq. pyridine (83) gives (yields: 60–65% (80), 60% (76)) ethyl ω-phenylcarbazinate (*β*-carb-

C̄ has strong lachrymatory properties. — [For study of toxicity see (11).] — C̄ is comml. chemical in U.S.A.

[For prepn. of C̄ from carbonyl chloride (phosgene) (3:5000) with abs. EtOH (1:6130) (90% yield (12)) in pres. of *dimethylaniline, quinoline, or antipyrine (13) or even* $Ca(OH)_2$ (14) see indic. refs.; for formn. of C̄ from diethyl carbonate (1:3150) with PCl_5 (15), from diethyl pyrocarbonate $O(COOEt)_2$ (16) with $SOCl_2$ (17); from pentachloroethyl chloroformate [Beil. III-13, III_1-(6)] (18) or *bis*-(trichloromethyl) carbonate (triphosgene) (3:1915) (19) or *bis*-(trichloromethyl) oxalate [Beil. III-17] (20) with EtOH, or from K xanthate, ethyl xanthate, or benzyl xanthate with Cl_2 + aq. in cold (21) see indic. refs.]

Pyrolysis of C̄. C̄ on htg at 250° decomposes yielding (4) EtCl (3:7015) + CO_2 (for study of this reactn. see (22) (23)); in pres. of certain hydrocarbons or esters (24) or in pres. of *dimethylaniline (25) temp. of this decomposition is lowered to 150°*, in pres. of quinoline to 59° (26) (27), in pres. of $AlCl_3$ to room temp. (28) (see also below under C̄ + pyridine or quinoline).

C̄ in pres. of anhydrous $ZnCl_2$ (29) (30) or even metallic Zn (31) decomposes at room temp. yielding (29) (30) EtCl (3:7015) + ethylene + CO_2 + HCl.

Reactions of the —$COOC_2H_5$ group of C̄. C̄ on hydrolysis, e.g., by boilg. with aq. or dil. acid (32), yields CO_2 + HCl + ethylene; on alkaline hydrolysis, however, no ethylene is formed (32); note that C̄ does not react with cold aq. very rapidly and may even be washed with it to remove alcohol.

[C̄ at its b.p. treated with Cl_2 in sunlight undergoes further substitution by halogen yielding as final prod. (33) (34) pentachloroethyl chloroformate (ref. given above under prepn. of C̄).]

[C̄ with $EtHSO_4$ at 100° under reflux for 6–8 hrs. gives (40% yield (48)) Et_2SO_4 + EtCl (3:7015).]

Reactions of the chlorine atom of C̄. [C̄ on reduction with 3% Na/Hg + aq. gives (51% yield (35)) salt of formic acid (1:1005).]

[C̄ in $CHCl_3$ with Na_2O_2 does not react until 1–2 drops of aq. are added; vigorous actn. then ensues with formn. of the expected (but very explosive) dicarbethoxy peroxide (EtOOC—O—O—COOEt) (36).]

[C̄ with NaSH (37) or with C_2H_5—S—MgBr (38 in ether gives (68% yield (38)) *O,S*-diethyl thiocarbonate [Beil. III-133, III_1-(62), III_2-(105)], b.p. 158–159° cor.; C̄ (2 moles) + aq. (39) or alc. (40) Na_2S, C̄ with BrMgSH in ether (41), or C̄ with aq. potassium trithiocarbonate (39), gives *diethyl thiodiformate (dicarbethoxy sulfide) [Beil. III-133, III_2-(105)]*, b.p. 180° dec.]

[C̄ with thallous fluoride 12 hrs. at room temp., then refluxed 2–3 hrs., gives (47% yield (42)) ethyl fluoroformate, lachrymatory oil, b.p. 57° (42).]

[For rate of reactn. of C̄ with KI in acetone at 25° see (43).]

[C̄ with aq. alc. KCN at −13° (44) or with solid NaCN (contg. 0.2–7.0% moisture) at not above 90° (45) gives (yields: 90% (45), 46% (44)) ethyl cyanoformate [Beil. II-547, II_1-(238), II_2-(510)], b.p. 115–116° (46), D_4^{20} = 1.0034 (47), n_D^{20} = 1.3821 (47).]

C̄ as carbethoxylating agent. C̄ is widely employed as a means of introducing the —COOEt group into other organic molecules by reactn. of the chlorine atom with the H of the alcoholic, phenolic, or enolic OH groups (or their metallic alcoholates, phenolates, enolates, etc.); under appropriate conditions C̄ is also *employed to introduce the —COOEt* group into an aromatic nucleus. Examples of these reactns. are cited below.

[C̄ with NaOMe yields (49) ethyl methyl carbonate [Beil. III-4, III_1-(4)], b.p. 109°. C̄ *with NaOEt yields diethyl carbonate (1:3150); other alcohols behave similarly (50).* — C̄ with K phenolate or C̄ with phenol in ether + dry K_2CO_3 gives (71% yield (51)) ethyl phenyl carbonate [Beil. VI-157], b.p. 229°; other mono-, di-, and polyhydric phenols behave

ethoxy-phenylhydrazine) [Beil. XV-286, XV₁-(71)], cryst. from dil. alc. or C_6H_6/lgr. as monohydrate, m.p. 85° (81) (82), anhydrous form, m.p. 82–83° (81), 80–82° (76). — C̄ with p-nitrophenylhydrazine in pyridine gives (84) β-carbethoxy-p-nitrophenylhydrazine, cryst. from alc., m.p. 198–199° (84). — C̄ with 2,4-dinitrophenylhydrazine in pyridine gives (84) β-carbethoxy-2,4-dinitrophenylhydrazine, cryst. from aq. alc., m.p. 168–169° (64).

C̄ (1 mole) with pyridine (1 mole) in the cold gives first a colorless addn. prod. (85) which rapidly turns red (can be used as test for pyridine (85)) and on warming rapidly decomposes with evolution of CO_2 + EtCl (3:7015); C̄ similarly treated with quinoline gives a yellow amorphous solid, considerably more stable than the above pyridine cpd., but at 100° decomposing similarly but more slowly (85) in the same manner (see also above under pyrolysis).

Ⓓ **Ethyl N-phenylcarbamate (phenylurethane):** ndls. from hot aq., tbls. from 90% alc., m.p. 51.5–52° (86), 51–52° (21) [From C̄ (1 mole) with aniline (2 moles) (86) (21) or from C̄ with aniline + cold aq Na_2CO_3 (87).] [For study of rate of this reactn. see (91).]

Ⓓ **Ethyl N-(p-tolyl)carbamate (p-tolylurethane):** pr. from alc., m.p. 52–53° (21), 52° (88). [From C̄ (1 mole) with p-toluidine (2 moles) in ether (21) (88).]

Ⓓ **N,N'-bis-(Benzyl)urea:** ndls. from alc., m.p. 167.5–169° cor. (89). [From C̄ (1 ml.) with benzylamine (3 ml.) + trace NH_4Cl refluxed 1 hr. (89); note that in this reactn. (unlike the two preceding cases) the reagent amine not only reacts with the chlorine atom of C̄ but *also* ammonolyzes the carbethoxy group; the prod. is therefore a disubstituted urea rather than the ethyl N-benzylcarbamate [Beil. XII-1049], lfts. from lgr., m.p. 48–49° (90), which is formed from C̄ + benzylamine + cold aq. NaOH (90).]

—— **N-(Carbethoxy)phthalimide:** unreported.

—— **N-(Carbethoxy)-3-nitrophthalimide:** unreported.

—— **N-(Carbethoxy)-tetrachlorophthalimide:** unreported. [Note that C̄ with K tetrachlorophthalimide fails to react under reflux and explodes on htg. in s.t. (92).]

—— **S-(Carbethoxy)isothiourea picrate:** m.p. 150–151° (93). [Note that C̄ (1 mole) with thiourea (1 mole) in conc. aq. soln. on treatment with $NaHCO_3$ in slight excess evolves CO_2 and ppts. S-(carbethoxy)isothiourea bicarbonate, bulky white ppt., insol. aq., m.p. 59–60° dec.; this ppt. on *immediate* treatment with dil. HCl dissolves and from the solution PkOH gives S-(carbethoxy)isothiourea picrate; the same prod. may also be obtd. from the original aq. soln. of C̄ + thiourea by direct addn. of PkOH (93). — Note, however, that the above bicarbonate on stdg. with aq. changes spontaneously to N,N-dicarbethoxythiourea, m.p. 97° dec., + thiourea. — Note, however, that C̄ (1 g.) with thiourea (1 g.) in EtOH (10 ml.) refluxed 30 min., then treated with PkOH (1 g.) does *not* yield the above prods. but instead (94) S-ethyl-isothiourea picrate, m.p. 187° (94).]

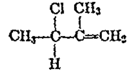
95°	at 729 mm.	(1)		

Note that all samples of C̄ reported prior to 1935 were undoubtedly mixts. of 2-chloropentane (C̄) with 3-chloropentane (3:7330). Each of these cpds. is with great ease partially converted to the other (see text), and their mixt. cannot be separated by fractional distillation (1).

[For prepn. of C̄ (or its mixt. with 3-chloropentane (3:7330)) from pentanol-2 (1:6185) with conc. HCl on long stdg. at room temp. (78% yield (1)) or in s.t. at 110° (3) see (1) (2) (3); with conc. HCl + $ZnCl_2$ (yield: 70% (6), 49% (16)) see indic. refs.; with PCl_3 + $ZnCl_2$ (64% yield (6)) or PCl_5 + $ZnCl_2$ (56% yield (6)) see (6); with $SOCl_2$ + pyridine (gives least rearr. (1)) (yield: 28% (1), 67% (6)) see (1) (6); from pentene-2 on shaking 10 hrs. at room temp. with conc. HCl see (5) (4).] [Note that both pentanol-2 (1:6185) and pentanol-3 (1:6175) with HCl even at room temp. give mixts. of 2-chloropentane (C̄) and 3-chloropentane (3:7330) (1).] [For formn. of C̄ in small amt. during reactn. of pentanol-1 (1:6205) with HCl + $ZnCl_2$ see (15).]

3:7300 *d,l*-3-CHLORO-2-METHYLBUTENE-1 C_5H_9Cl Beil. I - 211
(α,β-Dimethylallyl chloride) I_1-(87)
I_2--



B.P. 93.8° at 760 mm. (1) $D_4^{20} = 0.9088$ (1) $n_D^{20} = 1.4304$ (1)
18.0–18.1° at 30 mm. (1)

Note: C̄ by virtue of facile allylic transposition is in equilibrium with its synionic isomer, 1-chloro-2-methylbutene-2 (3:7485); reactns. of C̄ may therefore yield also derivatives related to its isomer.

[For prepn. of C̄ (or its mixt. with 1-chloro-2-methylbutene-2) by actn. of Cl_2 as specified (1) on "*tertiary amylene*" (*a mixt. consisting mainly of 2-methylbutene-2 (1:8220) with* some 2-methylbutene-1 (1:8210)) see (1). — The relative amt. of C̄ and its isomer is not constant but usually is about 60% of C̄ with 40% of 1-chloro-2-methylbutene-2, the ratio, however, being independent of the proportion of the two olefins in the starting material.]

[For formn. of C̄ from 2-methylbutene-2 (1:8220) with Cl_2 see (2); from 2-methylbutene-1 (1:8210) see (3); from 2,3-dichloro-2-methylbutane (3:7975) + alc. KOH (3) or by thermal dehydrohalogenation at 420–450° (4) see indic. refs.]

C̄ on hydrolysis gives not only the corresponding alc. but also that corresponding to the isomeric 1-chloro-2-methylbutene-2 (3:7485) together with a little isopropyl methyl ketone. For details see the isomer (3:7485).

C̄ with HCl yields (2) 2,3-dichloro-2-methylbutane (3:7975) + 1,3-dichloro-2-methylbutane (3:9228).

C̄ adds Br_2 giving (3) 1,2-dibromo-3-chloro-2-methylbutane, m.p. 197–198° (3).

100–101°		(10)			
100.5°	at 733 mm.	(11)			

Comml. $\bar{C}$ may contain unsatd. and P cpds. (14).

[For prepn. of $\bar{C}$ from *n*-butyric acid (1:1035) with PCl_5 (83% yield (15)), with PCl_3 (yield 69–77% (16)) (9) (17) or PCl_3 + $ZnCl_2$ (77% yield (15)), with $SOCl_2$ (yield: 97.4% (18), 90% (19), 85% (10), 80% (6) (7), 50% (15)) (20), with benzoyl chloride (80–87%

yield (8) (21), with phthalyl dichloride (3:6900) (91.5% yield (22)), with benzotrichloride (3:6540) + $ZnCl_2$ at 70–80° (23), or with $SiCl_4$ in xylene (49% yield (24)) see indic. refs.; *for prepn. of C̄ from α-chloroethyl n-butyrate on warming with a trace of $ZnCl_2$ see (25); for prepn. of C̄ from n-butyric acid (1:1035) by use of methyl chlorosulfonate, benzene*sulfonyl chloride, etc., see (26).]

[C̄ on htg. with n-butyric acid (9) or with sodium n-butyrate yields n-butyric anhydride (1:1126), b.p. 198.2° at 760 mm. (12), f.p. −75.0° (12), D_4^{21} = 0.9687 (27), $n_D^{19.73}$ = 1.4121 (27), n_D^{18} = 1.4143 (28).]

C̄ with Cl_2 in CCl_4 gives (17) a mixt. of α-, β- and γ-chloro-n-butyryl chlorides, some α-chloro-n-butyric acid anhydride also being formed (29); C̄ with SO_2Cl_2 in pres. of dibenzoyl peroxide gives (30) 15% α-chloro-n-butyryl chloride (3.5570), 55% β-chloro-n-butyryl chloride (3.9100), and 30% γ-chloro-n-butyryl chloride (3.5970). — For study of mech. of chlorination see (31). — [For action of PCl_5 on C̄ see (32).]

[C̄ with Br_2 in light yields (17) (33) (14) (34) α-bromo-n-butyryl chloride, b.p. 151–153° (34), and β-bromo-n-butyryl chloride.]

[*C̄ on cat. hydrogenation with H_2 + Pd-$BaSO_4$ cat. in ether (35) or in vapor phase (36)* gives n-butyraldehyde (1:0130), b.p. 74.7°; C̄ on reduction with Na/Hg or Na in moist ether yields (37) (38) (39) *octene-4-diol-4,5 di-n-butyrate*.]

[C̄ added to large excess of certain RMgX cpds. in ether is in part reduced and in part undergoes normal formn. of corresp. ketone: e.g., C̄ with *ter*-BuMgCl gives 9% reduction and 71% ketone formn. (6) (7) (11), products include n-butyl n-butyrate, *ter*-butyl n-propyl ketone (2,2-dimethylhexanone-3), and *ter*-butyl-n-propyl-carbinyl n-butyrate. — C̄ with excess C_6H_5MgBr gives (84% yield (40)) 1,1-diphenylbutene-1 [Beil. V-648, V_1-(313)].]

[C̄ with chlorosulfonic acid at room temp. (41) or with $AlCl_3$ in $CHCl_3$ followed by aq. (42) gives di-n-propyl ketone (butyrone) (1.5447), b.p. 144°. — Note, however, that C̄ on htg. with $AlCl_3$ at 60° without $CHCl_3$, then poured into aq., yields (42) (43) 2,4,6-triethylphloroglucinol [Beil. VI-1129], m.p. 107°.]

[C̄ with ethylene + $AlCl_3$ at 20° gives (70% yield (44)) (45) β-chloroethyl n-propyl ketone (1-chlorohexanone-3) [Beil. I-690]; C̄ with cyclohexene + $SnCl_4$ yields (46) 1-cyclohexenyl n-propyl ketone, b.p. 100–102° at 8 mm., D_4^{14} = 0.950, n_D^{14} = 1.4885 (oxime, m.p. 67°, semicarbazone, m.p. 175°) (46); C̄ with cyclohexane + $AlCl_3$ yields (47) α-methyl-cyclopentyl n-propyl ketone.]

[C̄ with C_6H_6 + $AlCl_3$ gives (89% yield (48)) (16) phenyl n-propyl ketone (butyrophenone) (1:5535), b.p. 230°; *C̄ with toluene + $AlCl_3$ gives (49) n-propyl p-tolyl ketone* Beil. VII-330, VII_1-(175)], b.p. 250°.]

[C̄ with $AlCl_3$ + *phenol yields (50) (51) (20)* 45% o-(n-butyryl)phenol, b.p. 124–126° at 14 mm. (51), 119° at 9 mm. (50), m.p. 10.5–10.6° (50), 8° (51), D_{25}^{25} = 1.0683 (50), $n_D^{25.5}$ = 1.5375 (50) (semicarbazone, m.p. 192–193° (50), phenylhydrazone, m.p. 85–87° (51)), and 30% p-(n-butyryl)phenol, b.p. 200° at 15 mm. (51), 187–189° at 9 mm. (50), m.p. 91–91.5° (50) (benzoate, m.p. 107–107.5° (50), 106–107° (51)); for reactn. of C̄ with carvacrol (1:1760) + $AlCl_3$ in nitrobenzene see (52), similarly with thymol (1:1430) see (53).]

C̄ on hydrolysis yields n-butyric acid (1:1035), b.p. 164°; for the amide, anilide, p-toluidide, and other derivs. corresp. to C̄ see n-butyric acid (1:1035).

Note that most samples of C̄ reported prior to 1938 undoubtedly contained a small amount of mixed 2-chloropentane (3:7325) and 3-chloropentane (3:7330). This previously unrecognized fact may be the cause of much variation in reported physical constants, especially the refractive index.

[For prepn. of C̄ (or its mixt. with 2-chloro- and 3-choropentane) from pentanol-1 (1:6205) with conc. HCl (7) (4) in s.t. at 120° for 12–15 hrs. (94% yield (2)) see indic. refs.; with HCl + $ZnCl_2$ (yield: 67% (30), 57% (8), 72% (9)) see (8) (9) (30); with PCl_3 + $ZnCl_2$ (70% yield (9)) or PCl_5 + $ZnCl_2$ (76% yield (9)) see (9); with $SOCl_2$ + pyridine (gives no rearrangement (8)) (yield: 80% (8), 87% (9)) see (8) (9); for prepn. (23% yield (10)) from γ-chloropropyl *p*-toluenesulfonate by reactn. with EtMgBr see (10).]

[For formn. of C̄ (together with other products) during chlorination of pentane see (11) (12) (13) (14).]

C̄ with EtOH forms const.-boilg. mixt., b.p. 72.5°, but forms no azeotrope with MeOH. C̄ forms with aq. a const.-boilg. mixt., b.p. 82°.

C̄ on htg. with conc. HCl + $ZnCl_2$ at 126–134° for 12 hrs. undergoes partial isomerization forming 3% of a mixt. of 2-chloropentane (3:7325) and 3-chloropentane (3:7330) (8).

[For study of rate of hydrolysis by aq. at 80° and 180°, and rate of cleavage of HCl at 180°, see (11); for rate of reactn. with KI in acetone see (4) (15) (16); for reactn. with Na—C≡CH see (17) (18); with KCN see (19); with Cl_2 see (6); for extensive study of reactn. with Na see (19) (20) (21) (22) (23) (24) (25).]

Ⓓ ***n*-Caproanilide:** C̄ with Mg in dry ether yields RMgCl which upon reactn. with phenyl isocyanate and subsequent hydrolysis yields (26) *n*-caproanilide, m.p. 96° cor. (27), 94–95° u.c. (26), 92° (28).

Ⓓ ***n*-Capro-*p*-toluidide:** m.p. 74–75° u.c. (26), 73° (28). [From RMgCl + *p*-tolyl isocyanate as above (26).]

Colorless tbls. or ndls. volatile even at ord. temp. — Vapors are lachrymatory; liquid blisters skin. — Appreciably sol. in aq. especially on warming, eas. sol. alc., ether. — Volatile with steam.

[For prepn. of Č from 1,3-dichloropropanol-2 (glycerol α-dichlorohydrin) (3:5985) by oxidn. with $Na_2Cr_2O_7$ + H_2SO_4 (68–75% yield (10)), with $K_2Cr_2O_7$ + H_2SO_4 (1) (2) (4) (6) (7) (8) (9) (11) (generally poorer yields) see indic. refs (note also that b.p. of Č is very close to that of the precursor 1,3-dichloropropanol-2 (3:5985), a fact which leads to some doubt as to the true yield of Č in certain of the older reports); for prepn. of Č from acetone (1:5400) with Cl_2 directly (12), in pres. of I_2, $FeCl_3$, or $SbCl_5$ (yield: 28% Č accompanied by 48.6% *unsym.*-dichloroacetone (3:5430) (13)), in pres. of $NiCl_2$ at 70° (other prods. are also formed (14)), or in pres of aq. + $CaCO_3$ (yield: 10% Č accompanied by other prods. (16)) (4) (15), see indic refs]

[For prepn. of Č from epichlorohydrin (3-chloro-1,2-epoxypropane) (3:5358) with S_2Cl_2 (yield: 33% Č accompanied by 67% *1,3-dichloropropanol-2 (3:5985)* (17)), from ethyl γ-(α)-chloro-α(γ)-ethoxyacetoacetate (18) or from ethyl α,γ-dichloracetoacetate (19) by ketonic cleavage with HCl, from allene (propadiene) (20) or 1,2-dichloropropene-2 (21) with HOCl, or from 1,3-diiodoacetone on digestion with AgCl (22) cf. (3) see indic. refs]

[Č on reduction with yeast gives (53% yield (2)) 1,3-dichloropropanol-2 (3:5985), b.p. 178° (2). — Č with Zn + AcOH does *not* give acetone but yields (23) a gas formerly supposed to have been cyclopropanone (since it yielded with semicarbazide a semicarbazone, m.p. 156° (23)) although in the light of later work (24) (25) (26) this now appears very doubtful. — For polarographic study of reduction potential of Č see (27).]

Č with aq. alk. presumably yields 3-chloropropanone-2-ol-1 [Beil. I-823] and/or propanone-2-diol-1,3 (dihydroxyacetone) [Beil. I-846, I_1-(428), I_2-(889)] since Č readily reduces Fehling's soln. (28).

Č with satd. aq. $NaHSO_3$ soln. yields a $NaHSO_3$ cpd. which seps. with 2½ H_2O (1), 3 H_2O (7). — Č with aq. K_2SO_3 soln. yields (30) corresp. salt of acetone-α,α'-disulfonic acid [Beil. IV_2-(530)].

[Č with KOAc (slightly more than 1 mole) in boilg. AcOH gives (48% yield (29)) chloroacetylmethyl acetate, b p. 112–114° at 16 mm. (29) — Č with K benzoate refluxed in alc. yields (23) 1,3-dibenzoyloxyacetone, long ndls. from alc., but m p. not reported]

[Č in dry MeOH treated with HCl gas gives (81.5% yield (31)) 1,3-dichloroacetone dimethylketal, cryst. from MeOH, m.p. 81.5° (31); Č in abs. EtOH similarly treated gives (smaller yield (31)) 1,3-dichloroacetone diethylketal, m p. 28° (31). — For reactn. of Č with ethylene glycol see (32).]

[For prepn. of C̄ from β,β′-dichlorodiethyl ether (3:6025) with solid NaOH at 200° (1) or with triethanolamine + solid NaOH (70% yield (2)) see indic. refs.]

C̄ is stable toward alkalies but with dil. acids even in cold is readily and quant. hydrolyzed (1) to β-chloroethanol (3:5552) and acetaldehyde (1:0100).

[C̄ with diethyl sodiomalonate gives (73% yield (1)) diethyl β-(vinyloxy)ethyl malonate, b.p. 130–135° at 9 mm., $D_{15}^{15} = 1.0575$ (1); this prod. condenses (1) with urea to give 5-(β-(vinyloxy)ethyl)barbituric acid (whose properties appear to be subsequently unreported) which itself with dil. minl. acid hydrolyzes to give 5-(β-hydroxyethyl)barbituric acid, m.p. above 300° (3). — For analogous reactions of C̄ with various diethyl alkylmalonates and reaction of the products with urea to give the corresp. 5-alkyl-5-(β-(vinyloxy)ethyl)-barbituric acids see (3). — C̄ with diethyl phenyl-sodio-malonate in s.t. at 140–145° for 14 hrs. gives (52% yield (4)) diethyl 5-phenyl-5-(β-(vinyloxy)ethylmalonate, b.p. 196–197° at 17 mm., $D_4^{20} = 1.098$; this prod. with urea gives (4), 5-phenyl-5-(β-(vinyloxy)ethyl)-barbituric acid which upon hydrolysis with dil. acid gives (10% yield (4)) 5-phenyl-5-(β-hydroxyethyl)barbituric acid ("hydroxyluminal").]

[C̄ with phenylacetonitrile gives (50% yield (4)) phenyl-(β-vinyloxyethyl)acetonitrile, b.p. 147° at 8 mm., $D_4^{20} = 1.029$ (4).]

[For use of C̄ in prepn. of cellulose ethers see (5).]

Note. C̄ by virtue of allylic transposition may yield derivatives of its synionic isomer 1,3-dichloro-2-methylpropene-1 (3:5590) q.v.

[For prepn. of C̄ (68% yield together with 32% yield of 1,1,2-trichloro-2-methylpropane (3:5710)) from 1-chloro-2-methylpropene-1 (β,β-dimethylvinyl chloride) (3:7120) with Cl_2 (1 mole) + $NaHCO_3$ (1.5 moles) at 0° see (1).]

C̄ on htg. under reflux gives (by allylic transposition) 1,3-dichloro-2-methylpropene-1 (3:5590), b.p. 132°.

C̄ with O_3 followed by hydrolysis yields (1) α,α-dichloroacetone (3:5430) + methylglyoxal (propanone-2-al-1) [Beil. I-762; I_1-(395), I_2-(819)].

3:7480 (1) Tishchenko, *J. Gen. Chem.* (*U.S.S.R.*) **8**, 1232–1246 (1938); *Cent.* **1939**, II 4223; *C.A.* **33**, 4190 (1939).

3:7485 1-CHLORO-2-METHYLBUTENE-2 C_5H_9Cl **Beil. I —**
(β,γ-Dimethylallyl chloride) I_1—
I_2-(189)

B.P. **110°** at 760 mm. (1) D_4^{20} = **0.9327** (1)
108–110° (2) n_D^{20} = **1.4481** (1)
25.9–26.4° at 25 mm. (1) D_4^{16} = **0.9324** (2)

Note. C̄ by virtue of facile allylic transposition is in equilibrium with its synionic isomer 3-chloro-2-methylbutene-1 (3:7300); reactns. of C̄ therefore may also yield derivatives related to its isomer.

[For prepn. of C̄ (or its mixt. with the synionic 3-chloro-2-methylbutene-1 (3:7300)) by actn. of Cl_2 as specified (1) on "tertiary amylene" (a mixt. consisting mainly of 2-methylbutene-2 (1:8220) with some 2-methylbutene-1 (1:8210)) see (1). — The relative amt. of C̄ and its isomer is not constant but usually is about 40% of C̄ with 60% of 3-chloro-2-methylbutene-1 (3:7300), the ratio, however, being independent of the proportion of the two olefins in the starting material.]

[For formn. of C̄ from 2-methylbutene-2 (1:8220) with Cl_2 see (2); from 2-methylbutene-1 (1:8210) see (3); for prepn. of C̄ (together with other prods.) from 1-chloro-2-methylbutanol-2 (3:8175) by distn. with anhyd. oxalic acid (4) or with Ac_2O + conc. H_2SO_4 (5) see (4) (5); for prepn. of C̄ from 2-methylbuten-2-ol-1 with PCl_3 + pyridine see (1).]

C̄ on hydrolysis gives not only the alc. corresponding to C̄ but also that corresp. to the isomeric 3-chloro-2-methylbutene-1 (3:7300) together with a little ketone: thus C̄ on hydrolysis with 12 pts. aq. at 70° for 16 hrs. gives (6) 25% alc. *A* (2-methylbuten-1-ol-3) [*N*-(α-naphthyl)carbamate, m.p. 91.5–93° (6)] + 50% alc. *B* (2-methylbuten-2-ol-1) [*N*-(α-naphthyl)carbamate, m.p. 103–103.5° (6)] + 5% isopropyl methyl ketone (1:5410);

3:7470 1-CHLOROPENTENE-2 C_5H_9Cl Beil. I —
(γ-Ethylallyl chloride) $CH_3.CH_2.CH{=}CH.CH_2Cl$ I_1—
I_2-(184)

B.P. 109–110°	(1) (2)	D^{23}_{-} = 0.9095 (3)	n_D^{23} = 1.4347 (3)
109.5°	(3)		
106–108°	(4)	$D_4^{21.5}$ = 0.908 (4)	$n_D^{21.5}$ = 1.4352 (4)
62–63.2° at 148 mm.	(5)		

Note. $\bar{C}$ by virtue of facile allylic transposition is readily converted to an equilibrium mixt. with its synionic isomer 3-chloropentene-1 (3:7260) q.v.; reactns. of $\bar{C}$ may therefore frequently yield also the corresponding derivatives of the isomer.

[For prepn. of $\bar{C}$ (or its mixt. with 3-chloropentene-1 (3:7260)) from penten-2-ol-1 with dry HCl gas at 0° (5) (7), with PCl_3 + pyridine (4) (7), or with $SOCl_2$ in ether (6) see indic. refs.; for prepn. of $\bar{C}$ from 3-chloropentene-1 (3:7260) by htg. at 225° (60–62% $\bar{C}$) see (6) (3).] [$\bar{C}$ is separable from the accompanying isomer by careful fractional distn. (7) (5).] [For formn. of $\bar{C}$ (together with other products) from pentene-2 (1:8215) + Cl_2 in CCl_4 see (8).]

$\bar{C}$ on long shaking with aq. Na_2CO_3 gives (7) in poor yield penten-2-ol-1 (*p*-nitrobenzoate, m.p. 53°) accompanied by much penten-1-ol-3. — $\bar{C}$ on htg. with alc. KOH gives (3) (7) in poor yield the corresp. ethyl ether, viz., 1-ethoxypentene-2, b.p. 123°, D^{23}_{-} = 0.7930, n_D^{23} = 1.4099 (3), accompanied by the isomeric 3-ethoxypentene-1, b.p. 102°, D^{23}_{-} = 0.7768, n_D^{23} = 1.3986 (3).

[For study of reactns. of $\bar{C}$ with KOAc in AcOH, with AgOAc, with *N*-methylaniline, with diethylamine, etc., see (7); for reactn. of $\bar{C}$ with phenol in pres. of K_2CO_3 + acetone see (5).]

Ⓓ *N*-(Penten-2-yl-1)phthalimide [*N*-(γ-ethylallyl)phthalimide]: colorless rhombic cryst. from alc., m.p. 69–70° (7). [From $\bar{C}$ on htg. with K phthalimide in a s.t. at 190–200° for 2½ hrs.; note that some of the corresp. deriv. from the isomer, viz., *N*-(α-ethylallyl)phthalimide, m.p. 78–79°, is formed to extent of about 10% (7).]

3:7470 (1) Mumm, Richter, *Ber.* **73**, 858–860 (1940). (2) Mumm, Hornhardt, Diederichsen, *Ber.* **72**, 107 (1939). (3) Prevost, *Compt. rend.* **187**, 1053–1054 (1928). 3:7475 3-CHLORO-2,2-DIMETHYLBUTANE $C_6H_{13}Cl$ Beil. S.N. 10
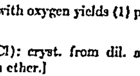
(Pinacolyl chloride;
ter-butyl-methyl-carbinyl chloride)



B.P. 109.9° at 734 mm. (1) D_4^{20} = 0.8767 (1) n_D^{20} = 1.4181 (1)

[For formn. of $\bar{C}$ (11%) from 2,2-dimethylbutane (neohexane) (1:8510) on chlorination see (1).] [Note that the corresp. alc. (pinacolyl alc.) (1:6186) with HCl does *not* give $\bar{C}$ but rather rearr. prods. (2).]

$\bar{C}$ with Mg in dry ether gives RMgCl which with oxygen yields (1) pinacolyl alc. (1:6186) q.v.

Ⓓ Pinacolyl mercuric chloride ($C_6H_{13}HgCl$): cryst. from dil. alc., m.p. 89–90° (3); 89.5–90° (2). [From RMgCl + $HgCl_2$ in ether.]

[For density of Č at 0°, 15°, 25°, 50°, and 65°, together with parachors at 0°, 25°, 50°, and 75°, see (9).]

[For prepn. of Č from corresp. alc., dimethyl-n-propyl-carbinol (2-methylpentanol-2) (1:6190) with PCl_5 (6), with HCl gas (1) (2), or with conc. HCl (4) (5) see indic. refs.; for prepn. (68% yield) from ethyl-isopropyl-carbinol (2-methylpentanol-3) (1:6194) with HCl as the result of rearrangement see (1); for formn. (together with other products) from reaction of 2-ethylbutanol-1 (1:6223) with HCl + $ZnCl_2$ see (3); for formn. from 2-methylpentene-2 (1:8275) by addn. of HCl see (7) (8).]

[For study of rate of reaction with KI in acetone see (5).]

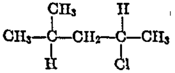
Č with Mg in dry ether yields RMgCl; upon treatment with oxygen this gives (48% yield (1)) of dimethyl-*n*-propyl-carbinol (2-methylpentanol-2) (1:6190) q.v.

- Ⓓ **Dimethyl-*n*-propyl-acetanilide:** m.p. 70.5–74° (3). [From Č via conversion to RMgCl and reaction with phenyl isocyanate (3).]
- Ⓓ **Dimethyl-*n*-propyl-acet-α-naphthalide:** m.p. 116–118° (3). [From Č via conversion to RMgCl and reaction with α-naphthyl isocyanate (3).]

3:7490 (1) Whitmore, Johnston, *J. Am. Chem. Soc.* 60, [illegible] (1938). (2) [illegible], *J. prakt.* [illegible] 1938). [illegible] *Soc.* 47, [illegible] 1937). [illegible] -3111 (1939).

3:7495 ***d,l*-4-CHLORO-2-METHYLPENTANE** $C_6H_{13}Cl$ Beil. I — I_1— I_2-(111)

(*d,l*-Isobutyl-methyl-carbinyl chloride)



B.P. 111–112° at 773 mm. (1) D_4^{20} = **0.861 (1)** n_D^{20} = **1.4113 (1)**

[For prepn. of Č from 2-methylpentanol-4 (1:6199) with dry HCl for 18 weeks (82% yield) see (1); for formn. of Č (together with other products) in reaction of 2-ethylbutanol-1 (1:6223) with HCl + $ZnCl_2$ see (2).]

Č with Mg in dry ether yields RMgCl which with O_2 gives (62% yield (1)) 2-methylpentanol-4 (1:6199) [*N*-(α-naphthyl)carbamate, m.p. 93.5–94.5° (2)]; this alc. upon oxidn. with CrO_3/H_2SO_4 yields (2) 4-methylpentanone-2 (1:5430) q.v.

3:7495 (1) Whitmore, Johnston, *J. Am. Chem. Soc.* 60, 2267 (1938). (2) Whitmore, Karnatz, *J. Am. Chem. Soc.* 60, 2535 (1938).

$\bar{C}$ on hydrolysis with 2 pts. aq. + 1 mole $CaCO_3$ for 4 hrs. at 70° gives (6) 60% alc. *A* + 30% alc. *B* + 5% isopropyl methyl ketone (1:5410); $\bar{C}$ on hydrolysis with CaO for 1½ hrs. gives (6) 70% alc. *A* + 25% alc. *B* + a trace of ketone.

[For study of reactn. of $\bar{C}$ with NaI (4) and its rate of reactn. with KI in acetone at 20° (7) or with NaOEt in alc. at 35° (7) see indic. refs.; the reactivity of the halogenation of *$\bar{C}$ is greater than that in crotyl chloride (1-chlorobutene-2) (3:7205) and the latter in* turn is more reactive than that in methallyl chloride (3-chloro-2-methylpropene-1) (3:7145) or allyl chloride (3:7035), which are about the same (4).]

$\bar{C}$ on treatment with O_3 followed by hydrolysis yields (3) (2) chloroacetone (3:7212) + acetaldehyde (1.0100).

3:7550 1,1-DICHLOROBUTANE $CH_3.CH_2.CH_2.CHCl_2$ $C_4H_8Cl_2$ Beil. I - 119

(*n*-Butylidene (di)chloride) I_1— I_2—

B.P. 114.5–115° at 763 mm. (1)		D_4^{20} = **1.0863** (7)	n_D^{20} = **1.4355** (7)
113.8–113.9° (2)			
113–115° (3) (7)			

[For prepn. (47% yield (4)) from *n*-butyraldehyde (1:0130) by actn. of PCl_5 (39% yield (9)) see (1) (2) (3) (9); for formn. from butane by chlorination see (5) (6); for formn. from *n*-butyl chloride (3:7160) on chlorination see (7) (8).]

[C̄ with equal wt. ethyl mercaptan gives (34% yield (33)) 1,3-*bis*-(ethylmercapto)-propanone-2, b.p. 117–121° at 15 mm. (33) (corresp. semicarbazone, m.p. 98–99°), but C̄ with large excess ethyl mercaptan (4 wt. pts.) gives *also* 1,2,2,3-tetra(ethylmercapto)-propane, oil (33). — C̄ (1 mole) with benzyl mercaptan (2 moles) in alc. NaOH yields (34) 1,3-*bis*-(benzylmercapto)propanone-2, oil, which on oxidn. in acid soln. with $KMnO_4$ gives the corresp disulfone, ndls. from alc., m.p. 182° (34).] — [For reactn. of C̄ with alk. sulfides and/or polysulfides in prepn. of resins see (37).]

C̄ with KI even at room temp. (7) yields 1,3-diiodoacetone, pr. from acetone, m.p. 61°.

[For reaction of C̄ with MeMgBr as means of prepn. of *sym.*-dichloro-*ter*-butyl alcohol (3:5977) see the latter.]

[C̄ with excess conc. aq. or liq. HCN in alc. at 30° for 12 hrs. (11) cf. (35) or with 25% HCN in pres. of a little NH_4OH (36) yields β,β′-dichloro-α-hydroxyisobutyronitrile (not isolated), which on hydrolysis with HCl (11) (35) (36) gives the corresp. acid, β,β′-dichloro-α-hydroxyisobutyric acid, m.p. 91–92° (11).]

[C̄ with diazotized aniline in pres. of NaOAc yields (3) 1,3-dichloro-1-(benzeneazo)-propanone-2, red-or. cryst. from hot alc., m.p. 156–157° (3); for corresp. homologs using diazotized *o*-toluidine or *p*-toluidine see (3).]

[C̄ with equiv. molar quant. thioacetamide in acetone or alc. followed by htg. with $ZnCl_2$ (38) (39) gives 4-(chloromethyl)-2-methylthiazole hydrochloride (free base is oil, b.p. 65–67° at 3 mm. (38) (39)); for polymerization of this prod. by htg. see (38). — C̄ with thiobenzamide in acetone followed by htg. of resultant intermediate with HCl in acetone gives 4-(chloromethyl)-2-phenylthiazole hydrochloride (yields: 80–81% (40) (41)) (corresp. free base, m.p 51° (40), 48.2–51.2° cor. (41)); for reactns. of this prod. see (41). — For analogous reactn. of C̄ with many other substituted thiobenzamides to give corresp. substituted thiazoles see (40) (39).]

[C̄ with equiv. molar amt. carbamyl chloride in dry ether at room temp. for 15 min. is claimed (2) to yield β,β′-dichloroisopropyl carbamate ("Aleudrin"), white cryst. from alc., m.p. 80–81° (2); C̄ with 2 molar equivs. of carbamyl chloride similarly treated is claimed (2) to yield β,β-dichloroisopropyl allophanate, cryst. from 60% alc., m.p. 182° (2); note, however, that in view of the facts that the C̄ used in the cited work was obtd. from 1,3-dichloropropanol-2, that the b.p.'s of this precursor and C̄ are almost identical, and that the C̄ employed was purified only by distillation, the indicated esters may have been due to the presence of unoxidized starting material.]

Ⓓ **1,3-Dichloropropanone-2 semicarbazone:** m.p. 120° (23). [Note that this prod. is very sensitive to heat (care in recrystn. from aq. or C_6H_6) and is also changed by stdg. in solution (23).]

Ⓓ **1,3-Dichloropropanone-2 4-(*p*-bromophenyl)semicarbazone:** ndls. from alc., m.p. 196° cor. dec. (42). [From C̄ + 4-(*p*-bromophenyl)semicarbazide in alc. refluxed for 12 hrs. (42).]

Ⓓ Condensation product ($C_{17}H_{19}O_4N_3SCl_2$) of C̄ with *N*-methyl-3-(carbohydrazido)-pyridinium *p*-toluenesulfonate: cryst. from 1:1 alc./ether, m.p. 115° cor. (43). [From C̄ with nicotinic acid hydrazide metho-*p*-toluenesulfonate in abs. alc. on refluxing for 15 mins. (43).]

3:0563 (1) Markownikow, *Ann.* **208**, 353–358 (1881). (2) Sen, Barat, *J. Indian Chem. Soc.* **2**, 77–81 (1925). (3) Favrel, *Bull. soc. chim.* (5) **1**, 983–986, 989 (1934). Liquid with penetrating odor. — Insol. aq., eas. sol. alc., ether.

[For prepn. of $\bar{C}$ from ethyl methyl ketone (butanone-2) (1:5405) with Cl_2 in pres. of $CaCO_3$ + aq. (yields of $\bar{C}$ about 75% always accompanied by 25% of the isomeric 1-chlorobutanone-2 (3:8012)) see (2) (6) (7) (10) cf. (11); with Cl_2 as vapor-phase chlorination see (12) (13) (14); with Cl_2 diluted with dry CO_2 see (15) (4); with Cl_2 in sunlight see (5) (16); with SO_2Cl_2 in sunlight see (5) (16) (17) cf. (11); with *N*-chlorourea in dil. AcOH see (1) (8); for prepn. of $\bar{C}$ from acetyl chloride (3:7065) with ethylene over activated carbon at 100° and 50 atm. see (18) (note that acetyl chloride + ethylene + $AlCl_3$ at 0° gives 4-chlorobutanone-2 (3:7640) q.v.); for prepn. of $\bar{C}$ from 2-chlorobutene-2 (3:7105) with Cl_2 + aq. + CCl_4 (65% yield) see (3).]

[$\bar{C}$ on reduction using yeast (20) gives levorotatory 3-chlorobutanol-2, b.p. 139° (cf. 3:8000), but with Zn + HCl (15) $\bar{C}$ yields butanone-2 (1:5405).]

$\bar{C}$ on oxidn. with conc. HNO_3 (5) (16) (20) yields α-chloropropionic acid (3:6125).

$\bar{C}$ on hydrolysis with aq. in s.t. at 150° for 6–8 hrs. (15), or $\bar{C}$ with alc. alk. (15) or MeOH/KOH (21) in cold, gives (84% yield (21)) butanone-2-ol-3 (acetyl-methyl-carbinol) (acetoin)

(1:5448) (as consequence of latter reactn. $\bar{C}$ reduces Tollens' reagt. or Fehling's soln. in cold).

$\bar{C}$ with satd. aq. $NaHSO_3$ soln. yields (15) a $NaHSO_3$ addn. cpd.

[$\bar{C}$ with conc. aq. KCN at 0° for 1 hr. gives (80% yield (21)) 2,3-epoxy-2-methyl-*n*-butyronitrile (*α*-cyano-*α*,*β*-dimethyl-ethylene oxide), b.p. 145°, $D_4^{20} = 0.9540$, $n_D^{20} =$ 1.4079 (21); $\bar{C}$ with alc. KCN gives (21) a mixt. consisting mainly of the above prod. together with a little *α*-methylacetoacetonitrile [Beil. III_2-(433)], b.p. 182–184° at 745 mm. with slight decompn. (22), b.p. 78° at 19 mm. (22), 68–70° at 12 mm. (23). (Note that the above represents a correction of the earlier views (5) (16) (24).)]

[$\bar{C}$ with conc. aq. $(NH_4)_2SO_3$ at 70° yields (9) butanone-2-sulfonic acid-3.—$\bar{C}$ with NaN_3 in aq. contg. AcOH yields (10) 3-azidobutanone-2, oil, b.p. 46° at 2 mm.]

[$\bar{C}$ with Na in abs. ether gives (15) by bimolecular coupling 3,4-dimethylhexanedione-2,5 [Beil. I-798, I_1-(409), I_2-(847)], b.p. 210° (15), 82° at 11 mm.; note therefore that sodium must not be used for drying $\bar{C}$ cf. (24).]

[$\bar{C}$ with triethyl orthoformate (1:3241) in abs. alc. in pres. of NH_4Cl as cat. gives (70% yield in 10 days but in absence of NH_4Cl only 39% (24)) *α*-chloroethyl methyl ketone diethylacetal, b.p. 80–84° at 36 mm., $D_4^{20} = 0.9773$ (24).]

[$\bar{C}$ with ethyl sodio-acetoacetate in abs. ether (4) or abs. alc. (25) (26) (24) gives (yields: 45–60% (24), 27–28% (26)) the expected ethyl *α*,*β*-diaceto-*n*-butyrate [Beil. III-757, III_1-(265), III_2-(468)], b.p. 150° at 28 mm. (25), 121–124° at 11 mm. (26). — $\bar{C}$ with ethyl acetoacetate (1:1710) + aq. NH_4OH + NH_3 gas htd. for 1 hr. gives (26% yield (4)) 3-carbethoxy-2,4,5-trimethylpyrrole [Beil. XXII-31, $XXII_1$-(497)], yel. cryst. from alc. or pet. eth., m.p. 101.5–102.5° (4), 104–105° (27), also obtd. from the above ethyl *α*,*β*-diaceto-*n*-butyrate with conc. aq. NH_4OH on warming (4). — $\bar{C}$ with *methyl* acetoacetate (1:1705) + conc. aq. NH_4OH in the cold gives (4) methyl *β*-aminocrotonate, m.p. 82–84° (4), which only on htg. condenses with the ester to give 3-carbomethoxy-2,4,5-trimethylpyrrole [Beil. XXII-31], cryst. from dil. alc., m.p. 124.5–126° (4) — $\bar{C}$ with *methyl* acetoacetate (1:1705) + CH_3NH_2 (33% in aq.) refluxed for some hours gives only very small yield (28) of 3-carbomethoxy-1,2,4,5-tetramethylpyrrole, cryst. from lgr., m.p. 101° (28).]

[$\bar{C}$ with diethyl acetonedicarboxylate (1:1772) in dry ether at −15° treated with NH_3 gas gives (10.7% yield (29)) 2-carbethoxymethyl-3-carbethoxy-4,5-dimethylfuran, b.p. 110–115° at 0.2 mm. (29).]

[For condens. of $\bar{C}$ with various phenols and phenol ethers see (30).]

[$\bar{C}$ with alc. NH_3 gives (15) in the cold the difficultly isolatable 3-aminobutanone [Beil. IV-319, IV_1-(452)], but on warming this condenses bimolecularly yielding (15) (8) tetramethylpyrazine [Beil. XXIII-99, $XXIII_1$-(28)], ndls. with $3H_2O$ from aq., m.p. 74–77°, but aq. lost in desic. to anhydrous prod., m.p. 86° (8) (corresp. picrate, m.p. 194–195° (31)). — $\bar{C}$ with aniline (2 moles) gives (15) on refluxing 2,3-dimethylindole [Beil. XX-319, XX_1-(130)], m.p. 107–109° (15).]

[$\bar{C}$ with thioformamide in abs. alc. for 4 days at 0° gives (22% yield (17)) 4,5-dimethylthiazole, b.p. 81–83° at 59 mm. (17) (corresp. picrate, cryst. from alc., m.p. 186–187° (17)). — $\bar{C}$ with NH_4 dithiocarbamate in abs. alc. refluxed ½ hr. gives (40% yield (17)) 2-mercapto-4,5-dimethylthiazole, cryst. from EtOAc, m.p. 163.5–163.8° (17). — $\bar{C}$ with benzamide + powd. $CaCO_3$ htd. at 110–120° for 10 hrs. gives (24% yield (32)) 4,5-dimethyl-2-phenyloxazole [Beil. $XXVII_1$-(219)], m.p. 50°, b.p. 128–130° at 5 mm. (32). — $\bar{C}$ with thiobenzamide + NaOAc htd. in abs. alc. gives (65% yield (32)) 4,5-dimethyl-2-phenylthiazole, b.p. 126–128° at 6 mm. (32).]

Ⓓ **3-Chlorobutanone-2 semicarbazone:** m.p. 148°, or on slow htg. 143–145° dec. (33), 127° (1).

3:7630 1-CHLOROHEXENE-1 $C_6H_{11}Cl$ Beil. S.N. 11

$$CH_3.CH_2.CH_2.CH_2—CH{=}\overset{Cl}{CH}$$

B.P. 121–121.5° (1) $D^{22}_{-} = 0.8872$ (1) $n^{22}_{D} = 1.4300$ (1)

[For formn. of C̄ (together with other prods.) from either 3,3-dichloropropene-1 (3:5140) or 1,3-dichloropropene-1 (3:5280) with n-propyl MgBr see (1).]

C̄ does not react with NaOEt at 130° (1).

C̄ readily reacts with Na yielding (1) hexene-1 (1:8255), b.p. 64°.

C̄ adds Br_2 yielding (1) 1,2-dibromo-1-chlorohexane, b.p. 107° at 13 mm., $D^{24}_{-} = 1.664$, $n^{24}_{D} = 1.515$ (1).

3:7630 (1) Kirrmann, Grard, *Compt. rend.* **190**, 876–877 (1930); *Bull. soc. chim.* (4) **47**, 843–847 (1930).

3:7640 4-CHLOROBUTANONE-2 C_4H_7OCl Beil. I - 670, I_1—, I_2-(731)

(β-Chloroethyl methyl ketone; 1-chlorobutanone-3)

$$CH_3—\underset{\overset{\|}{O}}{C}—CH_2—\underset{Cl}{CH_2}$$

B.P. 120–122°	at 760 mm.	(1)
50–55°	at 16 mm.	(2)
53–55°	at 16 mm.	(8)
53°	at 15 mm.	(7)
50°	at 15 mm.	(3)
48–50°	at 15 mm.	(4)

[*See also 3-chlorobutanone-2* (3:7598).]

Liquid with faint and not disagreeable odor.

[For prepn. of $\bar{C}$ from methyl vinyl ketone [Beil. I-728, I_1-(379), I_2-(786)] satd. at 0° with HCl gas directly (67% yield (4)) or in C_6H_6 soln. (5); from acetyl chloride (3:7065) with ethylene + $AlCl_3$ at 0° (yields: 33% (3), 53% (6)) cf. (2) or at 100° and 50 atm. press. (22); from 4-chlorobutadiene-1,2 (3:7225) by cat. hydration with conc. H_2SO_4 at −5° (yield 54% crude $\bar{C}$ (1)); from β-chloropropionyl chloride (3:5690) with $Zn(CH_3)_2$ (60% yield (7)); from butanol-1-one-3 (γ-keto-*n*-butyl alcohol) by saturation with HCl gas at 0° espec. in pres. of 5–10% $AlCl_3$ (63% yield (8)) see indic. refs.] — [Note that $\bar{C}$ is *not* formed by chlorination of ethyl methyl ketone (butanone-2) (21).]

$\bar{C}$ with hot aq. alk. or alk. carbonates gives only resins, but $\bar{C}$ on boilg. with dimethylaniline or better diethylaniline loses HCl giving (yields: 30% and 80%, respectively (7)) methyl vinyl ketone (see above), b.p. 79–80°; note, however, that $\bar{C}$ on warming with alc. KOH or quinoline loses both HCl and H_2O yielding (4) a mixt. of dienes, b.p. 65–75°.

[For behavior of potential $\bar{C}$ (mixt. of methyl vinyl ketone + HCl gas in C_6H_6) with ethylene glycol (1:6465) see (5); for reactn. of $\bar{C}$ with trimethylene glycol (1:6490) + K yielding γ-hydroxypropyl γ-keto-*n*-butyl ether see (3).]

[$\bar{C}$ with β-naphthol (1:1540) in EtOH/KOEt at 0° for 3 days gives (59% yield (9)) 1-(γ-keto-*n*-butyl)naphthol-2, cryst. from aq. alc., m.p. 88–89° (corresp. semicarbazone, pale yel. pr. from MeOH, m.p. 179–180° (9)).]

[$\bar{C}$ with 2-methylcyclohexanone (1.5470) in EtOH/NaOEt (or sodium isopropylate/isopropyl alc.) at 0° for 18 hrs. gives (yields: 15% (10), 10% (20)) 2-keto-10-methyl-2,3,4,5,6,7,8,10-octahydronaphthalene, b.p. 129–133° at 12 mm., n_D^{12} = 1.5250 (10).]

[$\bar{C}$ with diethyl sodio-methylmalonate in ether gives (11) diethyl (methyl)-(γ-keto-*n*-butyl)malonate, b.p. 114–116° at 0.4 mm.; $\bar{C}$ with ethyl α-isopropylacetoacetate in EtOH/NaOEt as directed yields (13) ethyl Δ-(1)*p*-menthenone-3-carboxylate-4.]

[$\bar{C}$ with aniline + conc. HCl or 40% H_2SO_4 htd. with nitrobenzene or H_3AsO_4 yields (14) (6) lepidine (4-methylquinoline) [Beil. XX-395, XXI_1-(150)]; for corresp. reactn. with other amines see (14) (6).]

[$\bar{C}$ with 1-aminoanthraquinone [Beil. XIV-177, XIV_1-(436)] in pyridine yields (15) 1-(γ-keto-*n*-butylamino)anthraquinone, dark red cryst. which dye cellulose acetate.]

[$\bar{C}$ with hydrazine hydrate in MeOH gives (80% yield (16)) (17) (19) by ring closure 3-methyl-Δ^2-pyrazoline [Beil. XXIII-30], liq., b.p. 56° at 15 mm. (16), sol. aq. but forming the corresp. picrate, B̄.PkOH, yel. ndls. from alc., m.p. 153° (16) (17) (19). — $\bar{C}$ in AcOH with methylhydrazine sulfate + NaOAc in aq. stood 2 hrs. gives (18) 1,3-dimethyl-Δ^2-pyrazoline, oil, which with ethereal picric acid gives the corresp. picrate, B̄.PkOH, m.p. 131.5–132.5° (18). — $\bar{C}$ with phenylhydrazine in ether gives (16) by ring closure 3-methyl-1-phenyl-Δ^2-pyrazoline, ndls. from ether by addn. of pet. ether, m.p. 76–77° (16).]

[$\bar{C}$ with $NH_2OH.HCl$ + K_2CO_3 in aq. MeOH htd. for a few minutes gives (20% yield (16)) by ring closure 3-methyl-Δ^2-isoxazoline [Beil. XXVII-12], oil, b.p. 60° at 15 mm. (16).]

Ⓓ **1-Carbamido-3-methyl-Δ^2-pyrazoline:** ndls. from EtOAc, m.p. 167–168° (18), 167° (16). [Note that $\bar{C}$ with 1 equiv. semicarbazide HCl + NaOAc in aq. immediately ppts. the corresp. semicarbazone; this on htg. for 10 min. with strong aq. NaOAc (or $\bar{C}$ + semicarbazide HCl + strong NaOAc soln. htd. directly in dil. alc. (19)) loses HCl and ring-closes to the indicated deriv.]

Ⓓ **1-Phenyl-3-methyl-Δ^2-pyrazoline:** ndls. from ether on addn. of pet. eth., m.p. 76–77° (16), 77° (1). [From $\bar{C}$ in ether with phenylhydrazine, followed by neutralization and drying with anhyd. K_2CO_3 (16) (1); note that the presumably intermediate phenylhydrazone loses HCl and by ring closure gives the indicated deriv.]

40.2°	(6)					

Ndls. or lfts. from alc. — Insol. aq.; eas. sol. alc., ether.

[For prepn. of C̄ from phenol (1:1420) with chloroacetyl chloride (3 5235) on htg. alone (7) (6) (3), in ether soln. + pyridine (2), or with $AlCl_3$ in CS_2 (1) see indic refs.; with chloroacetic acid (3·1370) + P_2O_5 in $CHCl_3$ (8) or on htg. with $POCl_3$ or $ZnCl_2$ (5) see (8) (5).]

C̄ hydrolyzes rather easily, even slowly on stdg. in moist air (3) C̄ on mere refluxing for ¾ hr. with abs. alc. or with alc. NaOEt undergoes trans-esterification yielding (3) ethyl chloroacetate (3:5700) and phenol (1:1420)

C̄ in ether treated with NH_3 gas reacts vigorously yielding (3) NH_4 phenolate (sol. in aq.) and chloroacetamide (insol. aq), m p. **118°** (3).

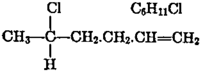
C̄ with aniline (2 moles) at 80° for 1 hr gives (4) aniline hydrochloride (sol. in aq.) + phenyl *N*-phenylaminoacetate [Beil. XII-471] *pptd from alc. by addn of aq , m p* 82–83° (4). [Note that C̄ on boilg with aniline yields (4) *N*-phenylaminoacetanilide (*N*-phenylglycine anilide) [Beil. XII-556], m p. 111–112° (4)]

C̄ with phenylhydrazine (2 moles) at 50° for ¼ hr. yields (4) phenyl β-phenylhydrazinoacetate [Beil XV-321], lfts. from C_6H_6 or from alc. by addn. of aq., m p. 93–94° (4).

C̄ htd. with $AlCl_3$ for 5 hrs. at 130–140° gives (10) *o*-hydroxyphenacyl chloride (vol. with steam), m p. 74°, + *p*-hydroxyphenacyl chloride (not vol. with steam), m.p 148°.

C̄ + equal wt. pyridine htd. at 100° gives (1) cpd. $\bar{C}.C_5H_5N.5H_2O$, ndls. from alc., m p. 165–168° dec. (11), cf. (4).

3:7665. *d,l*-5-CHLOROHEXENE-1 $C_6H_{11}Cl$ Beil. I - 215
(Biallyl hydrochloride) I_1—
I_2-(192)



B.P. 121–125° at 760 mm. (1)	D_4^{25} = 0.8891 (1)	n_D^{25} = 1.4279 (1)
120–124° (2)		
64–66° at 103 mm. (1)	D_4^{20} = 0.9141 (1)	n_D^{20} = 1.4305 (1)
43–45° at 45 mm. (1)		n_D^{15} = 1.4332 (1)
28–30° at 13 mm. (1)	D_4^{12} = 0.9105 (2)	n_D^{12} = 1.4350 (2)

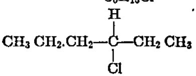
[The levorotatory isomeride of $\bar{C}$ has also been reported (3) from dextrorotatory hexen-1-ol-5 with PCl_5 in ether, b.p. 119–122° (3); ozonolysis followed by treatment with Br_2/aq. yields (3) levorotatory γ-chloro-*n*-valeric acid.]

[For prepn. of $\bar{C}$ from hexadiene-1,5 (biallyl) (1:8045) by shaking at room temp. with 5 vols. conc. HCl for 120 hrs. see (1) (4) (yield of $\bar{C}$ is 23% accompanied by 57% 1,5-dichlorohexane (3:9340) and other products (1)); for prepn. of $\bar{C}$ from hexen-1-ol-5 [Beil. I-444] with PCl_5 in $CHCl_3$ (30% yield + much resin (2)) see (2) (attempts to obt. $\bar{C}$ from this alc. with HCl gave (2) as a result of ring closure only 2,5-dimethyltetrahydrofuran [Beil. XVII-14], b.p. 93°).]

$\bar{C}$ on oxidn. with CrO_3/H_2SO_4 for 2½ hrs. at 90–95° gave (2) formic acid (1:1005) but no allylacetone.

3:7665 (1) Cortese, *J. Am. Chem. Soc.* **52**, 1519–1521 (1930). (2) Courtot, Pierron, *Compt. rend.* **190**, 1057–1059 (1930). (3) Levene, Haller, *J. Biol. Chem.* **83**, 599 (1929). (4) Wurtz, *Ann. chim.* (4) **3**, 171 (1864).

3:7670 3-CHLOROHEXANE $C_6H_{13}Cl$ Beil. S.N. 10
(*sec.*-(3)-Hexyl chloride;
ethyl-*n*-propyl-carbinyl chloride)



B.P. 123° (1)	D_{20}^{20} = 0.870 (2)	n_D^{20} = 1.4163 (2)
59.5–60° at 95 mm. (2)		

[For prepn. of $\bar{C}$ from hexene-3 (1:8270) in $CHCl_3$ by shaking with conc. HCl for 48 hrs. (45% yield) (HCl gas in $CHCl_3$ fails) see (2) (for study of rate of reaction in various solvents see (4)); from hexanol-3 (1:6203) in ether + HCl gas for 5 days see (1); for formn. of $\bar{C}$ (together with other products) from reactn of 2-ethylbutanol-1 (1:6223) with HCl + $ZnCl_2$ see (3).]

$\bar{C}$ with Mg in dry ether gives RMgCl which with O_2 yields (3) hexanol-3 (1:6203); this alc. upon oxidn. with CrO_3/H_2SO_4 yields (3) hexanone-3 (2,4-dinitrophenylhydrazone, m.p. 146.5–148.5° (3); semicarbazone, m.p. 110.5–111.5° (3)).

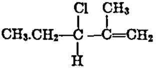
3:7660 *d,l*-3-CHLORO-2-METHYLPENTENE-1 $C_6H_{11}Cl$ Beil. S.N. 11
(α-Ethyl-β-methylallyl chloride)



B.P. 120–124° (1)

Note. C̄ by virtue of allylic transposition would be expected to be in equilibrium with its synionic isomer 1-chloro-2-methylpentene-2 (γ-ethyl-β-methylallyl chloride). The material reported by (1) was regarded as C̄; the isomer appears to be as yet unrecorded.

[For prepn. of C̄ from 2-methylpenten-1-ol-3 by htg. with $SOCl_2$ + pyridine at 65° for 4 hrs. see (1).]

C̄ in MeOH refluxed 4 hrs. with NaSCN gives (1) α-ethyl-β-methylallyl isothiocyanate, b.p. 100–200° at 760 mm., 75–90° at 10 mm. (1). [This prod. with conc. H_2SO_4 at 0° yields 4-ethyl-5,5-dimethyl-2-mercaptothiazoline, color cryst. from alc., m.p. 115–118° (1).]

3:7660 (1) Bruson, Eastes, *J. Am. Chem. Soc.* **59**, 2013 (1937).

Colorless liq. with not disagreeable odor.

[For prepn. of C̄ from butene-1 with Cl_2 in aq. (5), in CCl_4 (2), or at elevated temp. and press. in pres. of $CaCl_2$ + other cat. (8) (some 1,2,3-trichlorobutane (3:5935) is also formed (5)) see indic. refs.; for prepn. of C̄ from 1-chlorobutane (3:7160) with Cl_2 in sunlight or u.v. light (other isomers are also formed) see (9) (10) (11) (4) (7) (other isomers are always formed, and yield of C̄ is about 17% (7)) see indic. refs.; for formn. of C̄ from 2-chlorobutane (3:7125) with Cl_2 in light see (6).]

[C̄ with Cl_2 at −17° in dark gives (12) 1,2,3-trichlorobutane (3:5935) as main product.]

[C̄ is not hydrolyzed by boilg. aq. K_2CO_3 (6) but on htg. with excess 7–15% aq. $NaHCO_3$ + Na_2CO_3 at 135–195° under press. for 1–6 hrs. gives (13) butanediol-1,2 [Beil. I-477, I_2-(545)] + 2-chlorobutene-2 (3:7105) + ethyl methyl ketone (1:5405) + mixt. of buten-1-ol-3 and buten-2-ol-1.]

[C̄ passed as vapor over heated soda-lime as directed (9) (4) (10) (11), or C̄ + aq. vapor at 200–500° over silica gel + cat. (14), gives (24.8% yield (9)) butadiene-1,3 (divinyl) [Beil. I-249, I_1-(107), I_2-(224)].]

[C̄ with alc. KOH (1 mole + 25% excess) refluxed 3 days gives a mixt. contg. (2) cf. (18) 2-chlorobutene-1 (3:7075) + *cis*-1-chlorobutene-1 (3:7110) + *trans*-1-chlorobutene-1 (3:7110); note that by this method no butyne-1 is formed (15) and can be obtd. from C̄ + alc. KOH only by very drastic treatment, e.g., htg. in s.t. at 130–135° for 16–20 hrs. (15).]

[For reactn. of C̄ with phenylacetonitrile (benzyl cyanide) + $NaNH_2$ in liq. NH_3 giving (40% yield (16)) 1-cyano-2-ethyl-1-phenylcyclopropane, b.p. 93–94° at 1 mm., D_4^{20} = 0.9921, n_D^{20} = 1.52457, see (16); for condens. of C̄ with diphenyl ether (1:7125) + $AlCl_3$ see (17).]

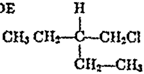
(1-Chloro-2-ethylbutane;
3-(chloromethyl)pentane)



B.P. 125–127° (1) D_4^{20} = **0.8914** (2) n_D^{20} = **1.4230** (2)
88° at 225 mm. (2)

[For prepn. of $\bar{C}$ from 2-ethylbutanol-1 (1:6223) with $SOCl_2$ + pyridine (82% yield) see (2); with 45% HCl in s.t. at 100° (11% yield) see (1). [Note that 2-ethylbutanol (1:6223) with conc. HCl + $ZnCl_2$ gives (2) by rearr. of the carbon chain 7 different chlorohexanes.]

$\bar{C}$ on shaking at 79–87° for 7 hrs. with conc. HCl + $ZnCl_2$ rearranges in part to a mixt. of other hexyl halides (2).

$\bar{C}$ with Mg in dry ether gives RMgCl; upon treatment with oxygen this yields (2) 2-ethylbutanol-1 (1:6223) q.v.

Ⓓ β-Ethylvaleranilide: m.p. 83–84° (2) [From $\bar{C}$ via conversion to RMgCl and reaction with phenyl isocyanate; so prepared, m.p. 80.5–81.5° (2).]

B.P. 125–130° dec. (1)

[For prepn of $\bar{C}$ from 2-methylhexen-5-ol-3 (allyl-isopropyl-carbinol) [Beil. I-447] with PCl_5 see (1).]

3:7730 (1) Fournier, *Bull. soc. chim.* (3) **15**, 886 (1896).

$\bar{C}$ on htg. in s.t. at 140–160° yields (29) 1,2-dichloropropane (3:5200) + acetone (1:5400); $\bar{C}$ similarly htd. with aq. yields (29) acetone (1:5400) + propionaldehyde (1:0110). — $\bar{C}$ on htg. with P_2O_5 yields (5) allyl chloride (3:7035) + 1-chloropropene-1 (3:7035).

$\bar{C}$ with aq. alk. readily gives (30) by loss of HCl and ring closure 1,2-epoxypropane (propylene oxide) (1:6115), b.p. 35°. [For study of rate of reactn. see (10) (31).]

$\bar{C}$ on oxidn. with CrO_3 yields (17) (14) (18) (5) (7) chloroacetone (3:5425) + AcOH (1:1010); $\bar{C}$ treated with $Ca(OCl)_2$ in cold, then warmed, yields (32) chloroform (3:5050) + AcOH (1:1010); $\bar{C}$ on oxidn. with HNO_3 yields chloroacetic acid (3:1370) + AcOH (1:1010) + oxalic acid (1:0445).

[For reactn. of $\bar{C}$ with Na_2S yielding (9) (33) β,β'-dihydroxy-di-*n*-propyl sulfide; with Me_3N in C_6H_6 on htg. in s.t. 8 hrs. at 100° giving (48% yield (34)) β-methylcholine chloride, m.p. 165° (34); with alkyl sulfates + alk. (35) to yield monoalkyl ethers of propylene glycol; with alkyl sulfates to yield (35) (36) β-chloroisopropyl alkyl ethers; with Br_2 + P to yield (8) 1-bromo-2-chloropropane, b.p. 117.5–118° at 756 mm., $D_4^{20} = 1.537$, $n_D^{20} = 1.47447$ (8), see indic. refs.]

—— **β-Chloroisopropyl acetate:** b.p. 149–150° (3) (2). [From $\bar{C}$ + AcCl (3).]

—— **β-Chloroisopropyl benzoate:** no b.p. recorded; $D_{19}^{19} = 1.172$ (14). [From $\bar{C}$ on htg. with BzCl at 180° (14); is saponified with great ease by alk. yielding propylene oxide (1:6115), b p. 35°.]

—— **β-Chloroisopropyl *p*-nitrobenzoate:** unreported.

Ⓓ **β-Chloroisopropyl 3,5-dinitrobenzoate:** m.p. 76.5–77.3° (38).

Ⓓ **1-(Phthalimido)propanol-2** [*N*-(β-hydroxy-*n*-propyl)phthalimide: m.p. 88–89° (39), 90–91° (40). [From $\bar{C}$ + K phthalimide in s.t. at 170° for 3 hrs. (39); see also under corresp. deriv. of 2-chloropropanol-1 (3:7917).]

71.0–71.5°	at 100 mm.	(10)		

[*See also* 2-*chloro*-2-*methylpropanol*-1 (3:7905).]

Colorless liq. somewhat sol. aq.; 100 g. aq. at 20° dis. 18.6 g. C̄ (note also that 100 g. C̄ at 20° dis. 19 g. H_2O) (9). — C̄ forms with aq. a const.-boilg. mixt., b.p. 93–94° at 760 mm., contg. 34% aq. (9).

[For prepn. of C̄ from 3-chloro-2-methylpropene-1 (methallyl chloride) (3:7145) or from 1-chloro-2-methylpropene-1 (β,β-dimethylvinyl chloride) (3:7120) by cat. hydration of their unsatd. linkage (63–66% yield) see (9) (11); note that the former with 80% H_2SO_4 at 0° or the latter with 90% H_2SO_4 at −10° to 0° stirred for 2½ hrs., poured onto ice, and distilled gives 63–66% of the initial chloride as C̄; note that other acids can also be used for this hydration, e.g., 85% H_3PO_4, 70% HNO_3, 60% $HClO_4$, benzenesulfonic acid, etc., each having its own optimum conditions (9); note also that in this process some 32–18%

respectively of the initial chloride is not hydrated but partially isomerized to a mixt. contg. 90% β,β-dimethylvinyl chloride (3:7120) + 10% methallyl chloride (3:7145) irrespective of whichever one was initially employed (9).]

[For prepn. of $\bar{C}$ from 1,2-dichloro-2-methylpropane (isobutylene dichloride) (3:7430) by liq.-phase hydrolysis of the more reactive halogen atom under neutral (or even slightly acidic or basic) conditions (best yield 48% by refluxing 18 hrs. with aq.) see (10).]

[For prepn. of $\bar{C}$ from chloroacetone (3:5425) or ethyl chloroacetate (3:5700) with MeMgBr (yields: 60% (5), 38% (12)) (3) (6) or MeMgI (20% yield (4)) see (3) (5) (6) (12) (note that $\bar{C}$ is accompanied (as a result of reaction of a second MeMgBr (13) (14)) by *some 2-methylbutanol-2 (1:6160)); for prepn.* of $\bar{C}$ from isobutylene with HOCl (yields: 64% (6), 63% (1), 60% (7), 47% (2)) (5) (15), with $Cl_2 + H_2O$ (16) (17) in pres. of 10% $CuCl_2$ (80–85% yield (24)), or with *ter*-butyl-hypochlorite (3:7165) (18) see indic. refs.; for formn. of $\bar{C}$ from 1,2-epoxy-2-methylpropane (isobutylene oxide) (1:6117) with HCl gas in ether see (19) (6) (4) (1) (note, however, that the prod. is a mixt. consisting of about ⅔ $\bar{C}$ contaminated with about ⅓ of the isomeric 2-chloro-2-methylpropanol-1 (3:7905)).]

[For formn. of $\bar{C}$ from 1-amino-2-methylpropanol-2 hydrochloride with conc. HCl in s.t. at 100° see (12).]

[$\bar{C}$ on reduction with Na/Hg in dil. HCl yields (2) (15) 2-methylpropanol-1 (isobutyl alcohol) (1:6165); this unexpected result presumably is due to intermediate formation of isobutylene oxide (1:6117) which on reduction opens the ring to give isobutyl alc. (not *ter*-butyl alcohol).]

[$\bar{C}$ on protracted oxidation, e.g., with mixt. of 1.5 wt. pts. fumg. HNO_3 + 3 5 wt. pts. conc. HNO_3 at 75° for 20 hrs. (2), gives traces of chloroacetone (3:5425) and a little oxalic acid (1:0445) and α-chloroisobutyric acid (3:0235) (5).]

$\bar{C}$ on refluxing with aq. is slowly (e.g., 56% in 14 hrs. (2)) (21) converted to isobutyraldehyde (1:0120); note that this reaction carried out above 100° under press. (20) is greatly accelerated.

[$\bar{C}$ with warm conc. HCl yields (10) (5) 1,2-dichloro-2-methylpropane (3:7430).]

$\bar{C}$ on solution in cold 45% H_2SO_4 followed by warming loses H_2O and yields (9) a mixt. consisting of about 90% 1-chloro-2-methylpropene-2 (methallyl chloride (3:7145)) accompanied by about 10% 1-chloro-2-methylpropene-1 (β,β-dimethylvinyl chloride) *(3:7120); a mixt. of these two chlorides has also been obtd. by use of* P_2O_5 (1) (2) or anhydrous oxalic acid (2) (22).]

[$\bar{C}$ added dropwise to dry powdered KOH, NaOH, CaO, or $Ca(OH)_2$ loses HCl and gives (95% yield using NaOH (10), 67% using KOH (6)) 1,2-epoxy-2-methylpropane (isobutylene oxide) (1:6117), b.p. 56.0–56.5° cf. (24).]

[$\bar{C}$ with aq. alkali ultimately yields 2-methylpropanediol-1,2 (isobutylene glycol) (1:6446) or its polymerization products; for study of kinetics of reaction of $\bar{C}$ with aq. alk. see (4) (8).]

[$\bar{C}$ with KCN in 4 vols. 80% alc. refluxed for 15–20 min. gives (45–50% yield (23)) β-hydroxy-isovaleronitrile [Beil. III-328], b.p. 210–212° at 756 mm., 130–132° at 30 mm., f p. −12°, $D_{-}^{20} = 0.96762$, $n_D = 1.42911$ (23).]

[$\bar{C}$ with aq. 23% $EtNH_2$ (4 moles) in s.t. at 100° for 8 hrs. gives (70–75% yield (25)) 1-(ethylamino)-2-methylpropanol-2, b.p. 156° ($\bar{B}$.HCl, m.p. 151° (25)). — $\bar{C}$ with aq. Et_2NH refluxed 3–4 hrs. gives (60% yield (26)) 1-(diethylamino)-2-methylpropanol-2, b.p. 164–165° at 761 mm. (26), $D_4^{20} = 0.8382$ (27), $n_D^{20} = 1.4253$ (27) ($\bar{B}$.PkOH, m.p. 99–100° (26)).— For reactn. of $\bar{C}$ with *N*-methylaniline, *N*-ethylaniline, or di-*n*-butylamine see (27).]

—— **Chloro-*ter*-butyl acetate:** b.p. 154° at 760 mm. (28), 153–154° (5), $D_4^{15} = 1.0626$ (28), $n_D^{15} = 1.4340$ (28). [From $\bar{C}$ + AcCl (5); also indirectly (28% yield (28)) from

isobutylene + N,N'-dichlorourea in AcOH.] — [For analogous indirect prepn. of the formate, chloroacetate, and trichloroacetate see (28).]

—— Chloro-*ter*-butyl benzoate: unreported.

—— Chloro-*ter*-butyl *p*-nitrobenzoate: unreported.

—— Chloro-*ter*-butyl 3,5-dinitrobenzoate: unreported.

Ⓓ 1-(*N*-Phthalimido)-2-methylpropanol-2 (*N*-(α-hydroxyisobutyl)phthalimide): ndls. or lfts. from alc., m.p. 106–107° (12). [From C̄ + K phthalimide in s.t. at 150° for 4 hrs. (60% yield (12)).]

Ternary Systems. $\bar{C}$ with *aq.* + HCl forms ternary const.-boilg. mixt., b.p. 96.6° at 756 mm., contg. 74.5 wt. % $\bar{C}$ + 20.2 wt. % aq. + 5.3 wt. % HCl (41): $\bar{C}$ with *aq.* + *acetone*, solubility diagram see (47): $\bar{C}$ + *ethylene glycol* (1:6465) + *acetone*, soly. of system at 23° see (48).

Preparation of $\bar{C}$. Because of the magnitude of the literature on this topic only a few selected references can be given here; reference should also be made to Beil. V-199, V_1-(109) and V_2-(148).

[For prepn. of $\bar{C}$ from C_6H_6 with Cl_2 in pres. of $SnCl_4$ at 30–40° (49), with NOCl at 425° (50), with HCl + O_2 (air) + cat. (51) see indic. refs.; for discussion of prepn. of industrial $\bar{C}$ see (52); for study of photochem. chlorination of C_6H_6 see (53).]

[For prepn. of $\bar{C}$ from aniline via formn. of benzenediazonium chloride/$ZnCl_2$ cpd. and htg. with molten phenol (40% yield $\bar{C}$ + 26% hydroxybiphenyl + 20% diphenyl ether (54)) or by isolation of solid benzene diazonium chloride and cautious decompn. by warming in various org. solvents see (55); from *p*-chloroaniline via formn. of *p*-chlorobenzenediazonium chloride/$ZnCl_2$ cpd. and htg. latter with EtOH (67% yield) or EtOH + Zn dust (60% yield) see (54); from phenylhydrazine by oxidn. with aq. $FeCl_3$ at 70° (61% yield) or with $HClO_3$ (30% yield) see (56); fro[illegible] (60% yield (57)), sulfuryl chloride (57), [illegible] (57)), other aromatic sulfonyl chlorides [illegible] amines (59), or *N*-chloro-*p*-chlorobenzaldimine (60), see indic. refs.]

[For formn. of $\bar{C}$ from benzoyl chloride (3:6240) on htg. in porcelain tube at 550–600° see (61); from benzeneazotriphenylmethane on warming in CCl_4 see (62); from *bis*-(*p*-chlorophenyl)zinc by reaction with aq. see (63); from phenylboric acid with Cl_2/aq. or refluxed with aq. $CuCl_2$ (85% yield) see (64); from C_6H_6 + *n*-butyl chlorosulfonate + $AlCl_3$ (11% yield) see (65); from C_6H_6 with $SeCl_4$ + $AlCl_3$ see (66); from 4-chlorodiphenyl sulfide by htg. with sulfur see (67); from 2-chlorobenzophenone (3:0715) or 4-chlorobenzophenone (3:1914) on fusion with KOH/NaOH see (68).]

Pyrolysis. $\bar{C}$ passed over Pt wire at bright red heat (70) or through hot Fe tube (71) yields 4,4′-dichlorobiphenyl (3:4300) accompanied by biphenyl (1:7175), 4-chlorobiphenyl (3:1912), and other products.

Reduction. $\bar{C}$ in EtOH at 55° with excess H_2 at 3 atm. in pres. of Adams' cat. readily (72) yields cyclohexane (1:8405). — $\bar{C}$ with H_2 or $NH_2.NH_2$ in MeOH or EtOH in pres. of $Pd/CaCO_3$ gives (73) cf. (74) small yields of biphenyl (1:7175). — $\bar{C}$ with Na in boilg. EtOH (75), or Na/Hg in EtOH (76), or Na in AmOH (77), or NaOAm in AmOH (78) is dehalogenated, but extent of reactn. varies with conditions. — $\bar{C}$ with HI + P is unaffected at 300° but at 375° yields (79) benzene. — $\bar{C}$ in aq. or dil. alc. alk. with H_2 in pres. of Ni

splits off all (80) its halogen as HCl. — $\bar{C}$ with H_2 + Ni at 270° yields (81) benzene + biphenyl.

Behavior with chlorine. $\bar{C}$ with Cl_2 may add or substitute or both according to conditions. — $\bar{C}$ under dil. aq. NaOH with excess Cl_2 in sunlight (82) or with Cl_2 at 0° in dark as directed (83) (84) gives (90% yield (83)) heptachlorocyclohexane [Beil. V-23, V_2-(12)] (known in 2 stereoisomeric forms, "α," m.p. 146° (82), "β," m.p. 260° (82)). [For study of relative amts. addition and substitution with $\bar{C}$ + Cl_2 see (85).]

$\bar{C}$ with Cl_2 in pres. of $AlCl_3$ (86), Al/Hg (87), or $FeCl_3$ (86), or $\bar{C}$ with SO_2Cl_2 + S_2Cl_2 + $AlCl_3$ (88), or $\bar{C}$ htd. with $FeCl_3$ (89) or $PbCl_4{\cdot}2NH_4Cl$ (90), gives mainly 1,4-dichlorobenzene (3:0980) accompanied by other products. — $\bar{C}$ with Cl_2 at 400–700° in pres. of cat. yields (91) (92) 1,3-dichlorobenzene (3:5960) + 1,3,5-trichlorobenzene (3:1400) and other products.

Behavior with bromine. $\bar{C}$ with Br_2 (93) under aq. (82) or in pres. of $AlCl_3$ (94), Al/Hg (95), Al (99), or Fe (99), or $\bar{C}$ htd. with $FeBr_3$ (96), gives mainly 4-bromochlorobenzene [Beil. V-209, V_1-(116), V_2-(162)], m.p. 66°, together with other products; for study of rate in AcOH see (97). — $\bar{C}$ with Br_2 at elevated temp. gives greatly increased proportion of *meta*-bromochlorobenzene; e.g., $\bar{C}$ with Br_2 at 475° gives (98) 53% *m*-, 27% *p*-, and 20% *o*-bromochlorobenzenes.

Behavior with metals. $\bar{C}$ with Li in dry ether under dry N_2 gives (35–49% yield (100)) phenyllithium [Beil. XVI_1-(589)]; for reactns. of latter with fluoro, chloro, bromo, or iodobenzene see (101).

$\bar{C}$ on boilg. with Na yields (102) C_6H_6, biphenyl, and other products; $\bar{C}$ with Na in boilg. toluene yields mainly (102) C_6H_6 together with other prods. — $\bar{C}$ with amylsodium (from amyl chloride + Na) in lgr. gives (103) (104) (105) phenylsodium [Beil. XVI_1-(589)] which with CO_2 gives (105) benzoic acid; $\bar{C}$ with Na + diethyl carbonate in C_6H_6 gives (79% yield (106)) (for use of other esters such as methyl benzoate, ethyl benzoate, or diethyl oxalate in ether see (107)) or $\bar{C}$ with Na + benzophenone in C_6H_6 gives (98% yield (106)) (108) triphenylcarbinol (1:5985). — $\bar{C}$ with Na + $AsCl_3$ in xylene gives (82% yield (109)) triphenylarsine, $\bar{C}$ with Na + $SbCl_3$ in xylene yields (109) triphenylstibine.

$\bar{C}$ with Mg/Cu alloy in pres. of I_2 (110), or $\bar{C}$ with Mg in s.t. at 150–160° for 3 hrs. (111) (112), or $\bar{C}$ refluxed with Mg + Cu_2Cl_2 (113), gives (yields. 80% (110), 85% (111)) phenyl magnesium chloride.

Behavior with Al halides. $\bar{C}$ does not react with $AlCl_3$ even on long boilg. (dif. from bromobenzene and iodobenzene which react at once) (114). — $\bar{C}$ with freshly prepared fused $AlBr_3$ yields (115) bromobenzene.

Behavior with $AlCl_3$ + other compounds. $\bar{C}$ (2 moles) with CCl_4 (1 mole) + $AlCl_3$ (1.75 moles) in CS_2 gives (116) (117) *bis*-(4-chlorophenyl)dichloromethane [Beil. V-592], m.p. 52–53°, together with other products; $\bar{C}$ (6 moles) with CCl_4 (1 mole) + $AlCl_3$ (1 mole) htd. at 60–70° gives mainly (118) 2-chlorophenyl-*bis*-(4-chlorophenyl)chloromethane [Beil. V-703], m.p. 153°, accompanied by a small amt. *tris*-(4-chlorophenyl)chloromethane [Beil. V-703], m.p. 113°.

$\bar{C}$ with AcCl (3:7065) or Ac_2O + $AlCl_3$ yields *p*-chloroacetophenone (3:6735) q.v. for details.

$\bar{C}$ + furoic acid (1:0475) + $AlCl_3$ gives (18% yield (119)) 6-chloronaphthoic acid-1 (3:4845); $\bar{C}$ + methyl furoate (1:3452) + $AlCl_3$ gives in good yield (120) methyl 6-chloro-1-naphthoate.

$\bar{C}$ with phthalic anhydride (1:0725) + $AlCl_3$ gives (121) (122) (123) (124) *o*-(4-chlorobenzoyl)benzoic acid [Beil. X-750, X_1-(356)], m.p. 147–148°, which on ring closure with

conc. H_2SO_4 yields 2-chloroanthraquinone (3:4922) q.v. [For corresp. reactns. of C̄ with 4-bromophthalic anhydride (125), 4-sulfophthalic anhydride (126), naphthalene-1,2-dicarboxylic acid anhydride (127), or naphthalene-2,3-dicarboxylic acid anhydride (128) see indic. refs.]

Miscellaneous condensations. C̄ with acetylene + $AlCl_3$ gives (129) 1,2-bis(4-chlorophenyl)ethane (4,4'-dichlorodibenzyl) + other prods., cf. also (130). — C̄ with propylene in pres. of sulfonic acids at 86–130° gives (131) isopropylbenzene (cumene) (1:7440). — C̄ + hexene-3 + H_2F_2 gives (25% yield (132)) 4-chloro-(1'-ethylbutyl)benzene. — C̄ + cyclohexene + conc. H_2SO_4 gives (50% yield (133)) 4-chlorophenylcyclohexane. — C̄ + allyl chloride (3:7035) + conc. H_2SO_4 gives (133) 1-chloro-2-(*p*-chlorophenyl)propane.

C̄ + isopropyl alc. with 80% H_2SO_4 at 70° gives (72% yield (134)) 4-chloro-isopropylbenzene (3:8705). — C̄ with *ter*-butyl alc. + $AlCl_3$ gives (135) 4-chloro-*ter*-butylbenzene; C̄ with *ter*-amyl alc. + $AlCl_3$ gives (135) 4-chloro-*ter*-amylbenzene.

C̄ + CO + $AlCl_3$ + $TiCl_4$ at 60 atm. and 30–35° (136) or C̄ + HCN + $AlCl_3$ at 100° for 6 hrs. (137) gives *p*-chlorobenzaldehyde (3:0765). — C̄ + CO + cat. + steam at 300–400° (138) (139) gives benzoic acid. — C̄ with paraformaldehyde + $ZnCl_2$ (140) (142) or C̄ with formalin + HCl (141) or C̄ with chloromethyl methyl ether (3:7085) + $ZnCl_2$ (142) or C̄ with *bis*-(chloromethyl) ether (3:5245) + $ZnCl_2$ (142) yields *p*-chlorobenzyl chloride (3:0220) q.v. — C̄ with *p*-chlorobenzyl chloride (3:0220) + H_2SO_4 yields (142) 4,4'-dichlorodiphenylmethane.

C̄ with chloral (3:5210) or chloral hydrate (3:1270) + conc. or fumg. H_2SO_4 gives 1,1,1-trichloro-2,2-*bis*-(*p*-chlorophenyl)ethane ("DDT") (3:3298) q.v.

Hydrolysis. C̄ is unaffected by protracted boilg. with aq. or even alc. alk.; however, by use of increased temp. and press. especially in pres. of catalysts the hydrolysis of C̄ constitutes an extremely important industrial process for manufacture of phenol.

For general studies on the catalytic hydrolysis of C̄ to phenol with steam at elevated temperatures see (143) (144) (145) (146); for patents employing this method see (147)–(159) incl. — For résumé of prepn. of phenol via Raschig method (C_6H_6 + HCl + O_2 to C̄ with subsequent hydrolysis) see (160); for relevant patents see (161) (162) (163). — For sepn. of products of hydrolysis see (41) (164).

C̄ may also be hydrolyzed to phenol by means of aq. NaOH, $Ca(OH)_2$, Na_2CO_3, $NaHCO_3$, etc., at elevated temp. and press. especially in pres. of catalysts, notably copper: for impt. general review of these methods up to 1927 see (165); for general discussion see (166); for recent patents on this process and its variants see (167)–(182) incl. — For conv. of C̄ with alk. to 4-hydroxybiphenyl (1:1585) see (183) or to diphenyl ether (1:7125) see (184) (185) (186).

C̄ htd. with aq. Na_2S, NaSH, or H_2S under press. gives (187) (188) (189) (190) diphenyl sulfide and/or thiophenol. — C̄ + H_2S + cat. at 700° gives (191) thiophenol.

[For use of C̄ in prepn. of sulfur dyes by htg. with sulfur see (192) (193).]

Ammonolysis. C̄ with dry NH_3 does not react even in pres. of Cu + I_2 and high temp. and press. (194). — However, C̄ with conc. aq. NH_4OH htd. at high temp. and press. especially in pres. of Cu, Cu cpds., or other cat. yields aniline and/or diphenylamine; for general discussion of this reactn. see (195) (196) (197) (198) (199); for illustrative patents see (200)–(208) incl.; for purification of reactn. prod. see (209) (210). — For behavior of C̄ with Na in liq. NH_3 (211) and its use in detn. of halogen content of C̄ (212) see indic. refs. — For behavior of C̄ with KNH_2 in liq. NH_3 see (213) (214).

Nitration. C̄ on mononitration, e.g., with mixt. of 10 ml. HNO_3 (D = 1.52) + 50 ml. HNO_3 (D = 1.48) for 25 g. C̄ at 0° (215), gives a prod. contg. 69.9% *p*-chloronitrobenzene [Beil. V-243, V_1-(130), V_2-(183)], m.p. 82°, together with 29.8% *o*-chloronitrobenzene [Beil. V-241, V_1-(129), V_2-(180)], m.p. 32°; the *p/o* ratio is but little different at −30°;

[*See also* 1-*chloropropanol*-2 (3:7747).]

[For prepn. of C̄ from its acetate (see below) by alcoholysis with excess boilg. dry MeOH for 8 hrs. (83% yield) see (1); note that this prepn. really starts from the isomeric 1-chloropropanol-2, the conversion of which to C̄ involves the following steps: reaction with KOAc yielding $CH_3.CH(OH).CH_2(OAc)$, conversion of latter with HCl + $ZnCl_2$ to $CH_3.CH(Cl).CH_2(OAc)$, and finally alcoholysis to C̄ as mentioned above (1) (4); for formn. of C̄ by alk. hydrol. of its trichloroacetate see (9).]

[Note that although C̄ is formed in other ways (e.g., from propanediol-1,2 (propylene glycol) (1:6455) with HCl or S_2Cl_2 (5), from 2,3-epoxybutane (propylene oxide) (1:6115) *by addn. of* HCl (5), *from propylene with* HOCl (5), *or from α-chloro-n-propylamine with* HNO_2 (6)) the product of these reactions appears to be (5) (6) an inseparable mixt. of about 40% C̄ with 60% of the isomeric 1-chloropropanol-2 (3:7747).]

Reactions of the halogen atom of C̄. [C̄ when added dropwise to conc. aq. KOH loses HCl yielding (1) 2,3-epoxybutane (propylene oxide) (1:6115), b.p. 35°. — C̄ with KCN in 80% alc. contg. some NaI gives on warming (60% yield (2)) β-hydroxy-*n*-butyronitrile [Beil. III-309, III_2-(221)], b.p. 214–215° (2); note that this is *not* the product to be expected from simple replacement of Cl by CN and apparently results from preliminary formation of propylene oxide to which HCN then adds so as to give a straight (rather than forked) carbon chain.]

Reactions of the OH group of C̄. [C̄ reacts normally as a substituted primary alc. giving ethers, esters, oxidn. products, etc.]

[C̄ readily gives the corresp. ethers; e.g., C̄ with Me_2SO_4 on warming gives (7) β-chloro-*n*-propyl methyl ether, b.p. 98–99° at 756 mm., $D_4^{20} = 0.9946$, $n_D^{20} = 1.40754$ (7); C̄ with EtOH + conc. H_2SO_4 on htg. gives (54% yield (7)) β-chloro-*n*-propyl ethyl ether, b.p. 116–117° at 758 mm., $D_4^{20} = 0.9828$, $n_D^{20} = 1.41285$ (7); for corresp. formn. of ethers with *n*-propyl alc. (1:6150) and with allyl alc. (1:6145) see (7).]

[C̄ (1 mole) with SO_2Cl_2 (2.5 moles) at 130° gives (16% yield (7)) *bis*-(β-chloro-*n*-propyl) ether, b.p. 188° at 762 mm., $D_4^{20} = 1.109$, $n_D^{20} = 1.4467$ (7); note that this ether is not obtd. from C̄ with conc. H_2SO_4 (7).]

[C̄ on oxidn. with 3 wt. pts. conc. HNO_3 as directed (8) (2) gives (85% yield (2)) α-chloropropionic acid (3:6125), accompanied by some acetic acid (1:1010) and oxalic acid (1:0445); note that C̄ on oxidn. with chromic acid yields no α-chloropropionic acid but only acetic acid (1:1010) and formic acid (1:1005) (2).]

—— **β-Chloro-*n*-propyl acetate** [Beil. II-129, II_1-(58), II_2-(139)]: oil, insol. aq., b.p. 151–152° at 768 mm. (11), 152–153° at 750 mm. (1). [Prepd. indirectly; furthermore the prods. reported may be contaminated with some of the isomeric β-chloroisopropyl acetate cf. (10).]

—— **β-Chloro-*n*-propyl benzoate**: unreported.

—— **β-Chloro-*n*-propyl *p*-nitrobenzoate**: unreported.

—— **β-Chloro-*n*-propyl 3,5-dinitrobenzoate**: unreported.

for f.p./compn curve of system *p*-chloronitrobenzene/*o*-chloronitrobenzene (eutectic, m p. 14.7°, contg. 33.1% *p*-isomer) see (215). — For mononitration using 0.9 g. of 70% HNO_3 + 1.29 g. 94% H_2SO_4 per gram of $\bar{C}$ (216) or using nitrosulfonic acid (from fumg. HNO_3 treated with SO_2) at 30° (217) or using $Fe(NO_3)_3$ in Ac_2O at 40–45° (218) see indic. refs. — Note that no appreciable amt. of *m*-chloronitrobenzene is formed by direct nitration of $\bar{C}$.

$\bar{C}$ on dinitration, e.g., with 5 wt. pts. of a mixt. consisting of equal wts. of 92.8% HNO_3, 93.3% H_2SO_4, and fumg H_2SO_4 (contg. 14.2% SO_3) at 95° for 2 hrs. (219) gives 96.7% yield 2,4-dinitrochlorobenzene [Beil V-263, V-(137), V_2-(196)], cryst. from alc., m.p. 52–53°. [The other dinitro isomers are known but need not be discussed here.]

Sulfonation. $\bar{C}$ is insol. in cold conc. H_2SO_4; however, $\bar{C}$ on warming or on stdg. at room temp. for 48 hrs. (220) with equal wt. conc. H_2SO_4 dissolves and later ppts. *p*-chlorobenzenesulfonic acid [Beil. XI-54, XI_1-(14)], anhydrous cryst. from $CHCl_3$, m.p. 92–93° (220), monohydrate from aq , m.p. 67° (221). — $\bar{C}$ with fumg. H_2SO_4 (10% SO_3) below 60° for 1 hr. then poured into 6 vols. satd. aq. NaCl soln. gives (222) (223) sodium salt of *p*-chlorobenzenesulfonic acid which with PCl_5 yields corresp. sulfonyl chloride (see below). — For reactn. of $\bar{C}$ with $ClSO_3H$ see below. — [The corresp. *bis*- (4-chlorophenyl) sulfone [Beil. VI-327, VI_1-(149)] which may be formed in small amt. has m.p. 147–148°.] [For study of kinetics of sulfonation of $\bar{C}$ see (231).]

Ⓓ ***p*-Bromochlorobenzene:** $\bar{C}$ with 0.25–0.50 mole Br_2 at 60° in pres. of Fe gives (88% yield (99)) *p*-bromochlorobenzene, cryst. from alc., m.p. 67–68°.

Ⓓ **2,4-Dinitrochlorobenzene:** $\bar{C}$ on htg. with mixt. of HNO_3 + H_2SO_4 (see above under nitration) at 95° for 2 hrs. gives (96.7% yield (219)) 2,4-dinitrochlorobenzene, cryst. from alc., m p. 52–53°.

Ⓓ **4-Chlorobenzenesulfonamide:** $\bar{C}$ with $ClSO_3H$ in $CHCl_3$ as directed (224) gives 4-chlorobenzenesulfonyl chloride, cryst. from dry ether, m.p. 53°, which by boilg. with conc. NH_4OH or htg. with solid $(NH_4)_2CO_3$ for 30 min. at 100° gives 4-chlorobenzenesulfonamide, cryst. from dil. alc., m.p. 142–143° u.c. (224).

$\bar{C}$ with Mg in dry ether as specified (5) gives 74.4% yield corresponding RMgCl.

$\bar{C}$ converted (as above) to RMgCl and the latter oxidized with O_2 gives (42% yield (3)) 2-methylhexanol-2, b.p. 139.5–140.5° at 741 mm., 110° at 250 mm., $D_4^{20} = 0.813$, $n_D^{20} = 1.4173$ (3).

[For reactn. of RMgCl with ethyl chloroformate (3:7295) yielding (5) ethyl *n*-butyl-dimethyl-acetate, b.p. 66.5–70.0° at 16 mm., $n_D^{20} = 1.4148$ (5) (corresp. amide, m.p. 92.8–93.8° (5)) see (5); for reactn. of RMgCl with AcCl (3:7065) giving (9% yield (5)) 3,3-dimethylheptanone-2, b.p. 68–70.5° at 20 mm., $n_D^{20} = 1.4206$ (semicarbazone, m.p. 129–130°) (5) see (5).]

$\bar{C}$ converted to RMgCl and treated with CO_2 gives (5) *n*-butyl-dimethylacetic acid (constants not given (5)) (corresp. amide via acid chloride, m.p. 92.8–93.8° u.c. (5)).

M.P. 45–46° (1)
41–42° (2)

White ndls. from alc.

[For prepn. of C̄ from 2,6-dichloro-3-aminotoluene [Beil. XII-872] via diazotization and use of Cu_2Cl_2 reactn. see (1); from *p*-toluenesulfonyl chloride via chlorination, hydrolysis to acid, and subsequent hydrolytic cleavage of the sulfonic acid radical see (3) (2); for formn. of C̄ together with other prods. from 2,5-dichlorotoluene (3:6245) or 2,6-dichlorotoluene (3:6270) with Cl_2 in pres. of Al/Hg see (4).]

[C̄ with Cl_2 in pres. of Al/Hg yields (5) 2,3,5,6-tetrachlorotoluene (3:2575).]

C̄ on mononitration by soln. in cold fumg. HNO_3 yields (1) 2,3,6-trichloro-5-nitrotoluene [Beil. V-333], ndls. from alc., m.p. 57–58° (1); C̄ on dinitration, e.g., with 6 pts. fumg. HNO_3 + 4 pts. conc. H_2SO_4 (1), yields 2,3,6-trichloro-4,5-dinitrotoluene [Beil. V-346], pr. from AcOH, m.p. 140–142° (1), 140–141° (6).

C̄ on oxidn. with dil. HNO_3 in s.t. at 140° yields (1) 2,3,6-trichlorobenzoic acid (3:4500), m.p. 164°.

{$\bar{C}$ on htg. with sodium diethylacetate yields (2) corresp. anhydride, b.p. 230° (2).}

{$\bar{C}$ with Cl_2 yields (4) α-chloro-diethylacetyl chloride, b.p. 93° at 70 mm. (amide, m.p. 58° (4)); $\bar{C}$ with Br_2 yields (5) α-bromo-diethylacetyl *bromide*, b.p. 98–100° at 25 mm. (5); for reactn. of $\bar{C}$ with $AlCl_3 + C_6H_6$ see (6).}

{$\bar{C}$ (1 mole) upon addition to *ter*-butyl MgCl (3.7 moles) in dry ether yields (3) (by virtue of reducing actn. of the tertiary RMgX cpd.) 2-ethylbutanol-1 (1:6223), 2,2-dimethyl-4-ethylhexanol-3 (b.p. 131–132° at 150 mm., $D_{-}^{20} = 0.8339$, $n_D^{20} = 1.4340$–1.4362, *N*-(α-naphthyl)carbamate, m.p. 63–64°), and hexamethylethane (1:7090), m.p. 103° (3).}

$\bar{C}$ on hydrolysis yields 2-ethylbutanoic acid (1:1115) q.v. (for the amide, anilide, *p*-toluidide, and other derivatives corresponding to $\bar{C}$ see 1:1115).

CHAPTER XVIII

DIVISION B. *LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE*

Section 2. D_4^{20} less than 1.1500

(3:8000–3:8499)

3:8000 3-CHLOROBUTANOL-2 (β-Butylene chlorohydrin; pseudo-butylene chlorohydrin) $CH_3—CH(Cl)—CH(OH)—CH_3$ C_4H_9OCl Beil. I - 373, I_1—, I_2-(403)

B.P. 138–140°		(1)	D_0^{18} = **1.0692** (3) (4) n_D^{20} = **1.4422** (9)
138–139°	at 753 mm.	(2)	
136.0–137.5°	at 760 mm.	(3) (4)	
134–138°		(9)	
76–79°	at 100 mm.	(5)	

[*See also d,l-erythro-3-chlorobutanol-2* (3:8004) *and d,l-threo-3-chlorobutanol-2* (3:8002).]

C̄ in this present discussion designates the ordinary mixture of stereoisomeric configurations of 3-chlorobutanol-2.

Colorless somewhat viscous liq. of agreeable odor. — C̄ is sol. at 20° in 15 vols. aq (2); its sepn. from dilute aq. solns. is best effected by steam distillation at reduced pressure (6) cf. (9).

[For prepn. of C̄ from ordinary butene-2 (mixt. of *cis* and *trans* stereoisomers) by addn. of HOCl (yields: 55% (11), 50% (3), 20% (5)) (4) (1) (2), with Cl_2 + steam at 100° (60–65% C̄ together with 10–30% 2,3-dichlorobutane (3:7615) (6)), with Cl_2 + aq. at 40–50° (50–60% yield (6)) (9), or with *N*-chlorourea in dil aq acid 15–17° in pres. of $CuCl_2$ (best yield 79.9% C̄ + 20.1% 2,3-dichlorobutane (3:7615) obtd. in 5% AcOH (7), but proportion of the two products varies widely with nature of acid used) see indic. refs.]

[For tabular and graphic data on equilibrium consts. of binary system C̄ + aq, and ternary system C̄ + 2,3-dichlorobutane (3:7615) + aq. see (8).]

C̄ in s.t. at 180°, or C̄ with aq. in s.t. at 100° for 10 hrs. or at 120° for 3 hrs., gives (80–100% yield (3)) (10) butanone-2 (ethyl methyl ketone) (1:5405) + HCl (cf. also (14)).

[C̄ with solid KOH (5), or with 40–50% aq. NaOH or KOH (15–20% excess) at 75–90° (11) (10), or with aq. KOH, K_2CO_3, or PbO at ord temp. (3) (4) (2) causes elimination of HCl and gives (yields: 87–90% (11), 75–81% (10), 66% (5)) 2,3-epoxybutane (α,β-dimethylethylene oxide) (1:6116) (mixt. of *cis* and *trans* stereoisomers)]

[The simple alkyl ethers of C̄ have been prepared by indirect means; e g., from butene-2 by action of corresp. alkyl hypochlorites dislvd. in the corresp. alc. or by action of *N,N'*-
(3-chloro-2-methoxybutane), b.p. 116°,
chloro-2-ethoxybutane), b.p. 122–124°,
ropyl, and isoamyl ethers see (12).]

—— 3-Chlorobutyl-2 acetate: b.p. 161–165° at 760 mm., 71–73° at 30 mm., D_4^{20} = 1.0692, n_D^{20} = 1.4298 (13) cf. (7). [Prepd. indirectly from ord. butene-2 with *N,N*-dichlorobenzenesulfonamide + AcOH in ether (28% yield (13)).] [For analogous prepn. of the corresp. formate, chloroacetate, and trichloroacetate see (13).]

—— 3-Chlorobutyl-2 benzoate: b.p. 263–265.5 u.c. (7).

—— 3-Chlorobutyl-2 *p*-nitrobenzoate: unreported.

—— 3-Chlorobutyl-2 3,5-dinitrobenzoate: unreported.

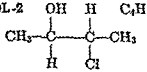
3:8002 *d,l-threo*-3-CHLOROBUTANOL-2 C_4H_9OCl Beil. S.N. 24



B.P. 130.8° at 748 mm. (1)		D_4^{25} = 1.0586 (1)	n_D^{25} = 1.4386 (1)
52.0° at 30 mm. (1)			
51.5–52.5° at 30 mm. (2)		D_4^{20} = 1.0626 (2)	n_D^{20} = 1.4403 (2)
51.6–52.1° at 30 mm. (1)			

[*See also ord.* 3-*chlorobutanol*-2 (3:8000) *and d,l-erythro-3-chlorobutanol*-2 (3:8004).]

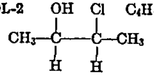
[For prepn. of $\bar{C}$ from *cis*-2,3-epoxybutane (1:6116) (2 moles) with conc. HCl (3 moles) at 5° or below (77% yield) see (1); from *cis*-butene-2 with *ter*-butyl hypochlorite (3:7165) in $AcOH/H_2SO_4$ (61% yield (1)) or with $Ca(OCl)_2$ in AcOH (2) see indic. refs.; from the diacetate of *meso*-butanediol-2,3 (1:6452) in conc. HCl contg. 1 drop conc. H_2SO_4 with large excess dry HCl gas at −10° for 90 hrs. (43% yield) see (1). — Note that $\bar{C}$ *cannot* be obtd. from butene-2 with aq. *N*-chloroacetamide (1).]

[$\bar{C}$ (1 mole) with $SOCl_2$ (1.5 moles) refluxed 3 hrs., then kept at 100° for 3 hrs. more, gives (17.4% yield (1)) *d,l*-2,3-dichlorobutane (3:7615); note, however, that $\bar{C}$ (1 mole) with $SOCl_2$ (2 moles) htd. 2 hrs. at 95° in pres. of pyridine gives (24% yield (1)) *meso*-2,3-dichlorobutane (3:7580). — Note that $\bar{C}$ with conc. HCl or with conc. HCl + $ZnCl_2$ *fails* to give any dichlorobutane; note also that $\bar{C}$ *fails* to react with 60% HBr even in s.t. at 100° for 3 hrs. (1).]

[$\bar{C}$ with very conc. aq. KOH at 90–95° loses HCl and gives (75% yield (1)) *cis*-2,3-epoxybutane (1:6116).]

3:8002 (1) Lucas, Gould, *J. Am. Chem. Soc.* **63**, 2541–2551 (1941). (2) Wilson, Lucas, *J. Am. Chem. Soc.* **58**, 2396–2402 (1936).

3:8004 *d,l-erythro*-**3-CHLOROBUTANOL-2** C_4H_9OCl **Beil. S.N. 24**



B.P. 135.4° at 748 mm. (1) D_4^{25} = 1.0610 (1) n_D^{25} = 1.4397 (1)
55.9–56.1° at 30 mm. (1)

[*See also ord.* 3-*chlorobutanol*-2 (3:8000) *and d,l-threo*-3-*chlorobutanol*-2 (3:8002).]

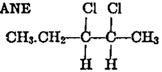
[For prepn. of C̄ from *trans*-2,3-epoxybutane (1:6116) (2 moles) with conc. HCl (3 moles) at 5° or below (82.5% yield) see (1).]

[C̄ (1 mole) with $SOCl_2$ (1.5 moles) refluxed 3 hrs., then kept at 100° for 3 more hrs. gives (16% yield (1)) *meso*-2,3-dichlorobutane (3:7580); C̄ (1 mole) in pyridine (2.2 moles) treated with $SOCl_2$ (2 moles) at 100° for 3 hrs. gives (63% yield (1)) *d,l*-2,3-dichlorobutane (3:7615), and C̄ (3 moles) with PCl_3 (1 mole) at 100° for 3 hrs. also gives (20% yield (1)) *d,l*-2,3-dichlorobutane (3:7615); note, however, that C̄ (1 mole) with PCl_5 (3.9 moles) in $CHCl_3$ refluxed 2 hrs. gives (42.7% yield (1)) a mixt. of *d,l*- and *meso*- forms of 2,3-dichlorobutane — Note that C̄ with conc. HCl or with conc. HCl + $ZnCl_2$ *fails* to give any dichlorobutane; note also that C̄ *fails* to react with 60% HBr even in s.t at 100° for 3 hrs. (1).]

[C̄ with aq. KOH loses HCl and gives (1) *trans*-2,3-epoxybutane (1:6116).]

3:8004 (1) Lucas, Gould, *J. Am. Chem. Soc.* **63**, 2541–2551 (1941).

3:8010 2,3-DICHLOROPENTANE $C_5H_{10}Cl_2$ **Beil. I - 131**
(*sym*.-Ethyl-methyl-ethylene dichloride) I_1—
I_2-(96)



B.P. 138–139.5° (1)
50–53° at 28 mm. (2)
50–51° at 20 mm. (3)

Principal component of comml. "amylene dichloride" (5).

[For prepn. of C̄ from pentene-2 (*unsym* -ethyl-methyl-ethylene) (1:8215) + Cl_2 at −17° (3) or below −5° (4) see indic. refs.; for formn. of C̄ (together with other products) from pentane (1:8505) + Cl_2 see (2) (5).]

C̄ on boilg. with 10% alc. KOH gives (2) 2-chloropentene-2 (3:7285), but C̄ with aq. K_2CO_3 gives no pentanediol-2,3 (see below).

C̄ on boilg. with Zn dust in alc. or on htg. with Na in xylene at 120° gives (6) pentene-2 (1:8215).

[C̄ + aq. vapor passed at 300° over $MgCl_2$ gives (48–50% yield (7)) pentadiene-1,3 (1:8035).]

C̄ on protracted (250 hrs) boilg. with 35 pts. aq. gives (3) traces of the corresp. glycol, pentanediol-2,3 [Beil. I-482], and either or both pentanone-2 (1:5415) and/or pentanone-3 (1:5420).

Liquid with penetrating odor. — Insol. aq.

[For prepn. of C̄ from ethyl methyl ketone (butanone-2) (1:5405) with Cl_2 in pres. of $CaCO_3$ + aq. (yields of C̄ about 25% always accompanied by 75% of the isomeric 3-chlorobutanone-2 (3:7598)) see (1) (3) (6) (10) (12); with Cl_2 in vapor phase (13) (14), with Cl_2 or SO_2Cl_2 in sunlight (8) (11), or with *N*-chlorourea (5) see indic. refs. — For formn. of C̄ from 1-chlorobutanol-2 (3:8025) by oxidn. with chromic acid (4), from butene-1 with HOCl (4), from 2-chloromethyl-2-ethyl-4-methyl-1,3-dioxolone-5 by hydrol. with AcOH/HCl (9), or from 2-(chloromethyl)butene-1 (3:9214) by ozonolysis (18) see indic. refs.]

[C̄ on reduction using yeast gives (15) 1-chlorobutanol-2 (3:8025).]

C̄ on oxidn. with HNO_3 (8) (11) yields chloroacetic acid (3:1370).

[C̄ on hydrolysis, e.g., by refluxing overnight with K formate in MeOH, yields (1) butanone-2-ol-1 (propionyl-carbinol) [Beil. I-826, I_1-(870)], b.p. 153–154°, 50.5–51.0° at 14 mm. (1); note, however, that C̄ with K acetate in EtOH gives (6) (8) (11) (65–70% yield (6)) propionyl-carbinyl acetate, b.p. 176° (8) (11), 178–180° (6).]

[C̄ with conc. aq KCN even in the cold yields (8) (11) the corresp. nitrile, propionylacetonitrile [Beil. III-671], b.p. 164–165° (8) (11), colorless liq., insol. aq. — C̄ with conc. aq. $(NH_4)_2SO_3$ at 70° yields (7) butanone-2-sulfonic acid-1. — C̄ with NaN_3 in aq. contg. AcOH yields (10) 1-azidobutanone-2, oil, b p. 56° at 2 mm. (10)]

[C̄ with thiourea refluxed for 2 hrs. gives (72% yield (16)) 2-amino-4-ethylthiazole hydrochloride, cryst. from alc./acetone, m.p. 185.5–187.5° u.c.; this salt with conc. aq. NH_4OH gives the free base, m.p. 35°, b.p. 118–120° at 7 mm. (16) (corresp. acetyl deriv., m.p. 117.5° u c. (16)). — C̄ with thiobenzamide + NaOAc htd in alc. gives (67% yield (17)) 4-ethyl-2-phenylthiazole, yel. cryst. from xylene, m p. 117–118° (17)]

C̄ with phenylhydrazine yields (4) a prod., yel. cryst. from AcOH, m.p. 210–215° dec., whose structure is in doubt.

Ⓓ **Chloromethyl ethyl ketone semicarbazone:** m.p. 121° (5), 120–121° (18).

Ⓓ **Condens. prod. of C̄ with *N*-methyl-β-carbohydrazidopyridinium *p*-toluenesulfonate:** cryst. from 1 1 EtOH/ether, m p. 136–137° cor. (19). [From C̄ + indicated reagent refluxed 15 min. in abs. alc. (19).]

Ⓓ **1-(Phthalimido)butanone-2:** ndls. from hot aq , m.p. 107° (12). [From C̄ with K phthalimide in dry xylene 2 hrs at b p. (27% yield (12)).]

3:8115 2-CHLORO-3-ETHYL-3-METHYLPENTENE-1 $C_8H_{15}Cl$ **Beil. S.N. 11**

B.P. 147° at 743 mm. (1) n_D^{25} **= 1.4450 (1)**
53° at 20 mm. (1) D_4^{20} **= 0.9147 (1)**

[For prepn of C̄ from 3-ethyl-3-methylpentanone-2 [Beil. I_2-(760)] (1) with PCl_5 (65% yield) see (1).]

C̄ with $NaNH_2$ in mineral oil at 160–165° gives 45% yield 3-ethyl-3-methyl-pentyne-1, b.p. 98–100° at 745 mm., $D_4^{20} = 0.7360$, $n_D^{20} = 1.4102$ (Ag salt, darkens 167°, melts 191.5°) (1).

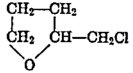
3:8115 (1) Davis, Marvel, *J. Am. Chem. Soc.* **53**, 3844–3845 (1931).

3:8117 α-CHLOROCROTONALDEHYDE C_4H_5OCl **Beil. I - 731**
(2-Chlorobuten-2-al-1) I_1—
I_2-(789)

B.P. 147–150° at 760 mm.	**(1)**	D_4^{23} **= 1.1404 (4)**	n_D^{23} **= 1.478 (4)**
147–149°	**(2)**		
147°	**(3)**	D_4^{15} **= 1.1422 (4)**	
146–148°	**(4)**		
53–54° at 20 mm.	**(4) (5)**	D_4^{0} **= 1.1590 (4)**	

Colorless lachrymatory liq. gradually becoming colored in light. — Spar. sol. aq.; eas. sol. alc., ether, $CHCl_3$. — Volatile with steam. — Note that although two geometrical isomers are possible only this one (configuration uncertain) is known.

3:8152 TETRAHYDRO-α-FURFURYL CHLORIDE C_5H_9OCl Beil. S.N. 2362
(2-(Chloromethyl)tetrahydrofuran)



B.P. 150–151°	at 762 mm. (1)	D_4^{20} = 1.1102 (2)	n_D^{20} = 1.4560 (2)
149.0–149.5°	at 721 mm. (2)		
47–48°	at 15 mm. (3)		n_D^{12} = 1.45922 (1)
41–42°	at 11 mm. (3)		
38.5–39°	at 10 mm. (2)		

Water-white liq. with mild and pleasant odor. — C̄ has no lachrymatory properties and is relatively stable (2); its chlorine atom is extremely unreactive (2).

[For prepn. of C̄ from tetrahydro-α-furfuryl alcohol (1:6445) with $SOCl_2$ + pyridine *(yields: 75% (2), 73–75% (3)) see indic. refs.; note that attempts to replace $SOCl_2$ by* PCl_3 (excess) in dry ether (2) were *not* successful; for formn. of C̄ from 5-chloropentanediol-1,4 (1) by dehydrative ring closure with 15% H_2SO_4 at 100° for 2 hrs. (19% yield) see (1).]

C̄ with metallic Na in dry ether under reflux, subsequently decomposed by water, gives (yields: 82% (4), 76–83% (3)) penten-4-ol-1 (penten-1-ol-5) [Beil. I-443, I₂-(483)], b.p. 141.0–141.5° at 758 mm. (5), 139° at 760 mm. (6), 138.8–139.3° at 760 mm. (7); D_4^{25} = 0.8588 (7), D_4^{20} = 0.8457 (5); n_D^{20} = 1.43085 (5), $n_D^{15.5}$ = 1.4312 (8), n_D^{15} = 1.4305 (9) (corresp. allophanate, m.p. 148° (6), 147–148° (9); corresp. *N*-phenylcarbamate, oil, b.p. 183.5° at 16 mm. (8)).

C̄ with thiourea refluxed in alc. 4 days gives (10) *S*-(tetrahydro-α-furfuryl)isothiourea, isolated as corresp. picrate, m.p. 153.0–153.5° (10).

53–54°	at 16 mm.	(3)

D^{20}_{20} = **1.017** (3) n^{20}_{D} = **1.4171** (3)

[For prepn. from vinyl acetate (b.p. 69–71°) by treatment in abs. EtOH soln. with Cl_2 in dark and in a solid CO_2/acetone cooling bath (83% yield) see (3); from acetaldehyde diethylacetal ("acetal") (1:0156) with Cl_2 at 50° in presence of abs. alc. NaOEt (90% yield) see (4); from paraldehyde (1:0170) by chlorination and subsequent treatment *with EtOH see (5) (6); from EtOH (1:6130) by treatment with* Cl_2 see (7) (8).]

[For prepn. of C̄ from chloroacetaldehyde (3:7212) on warming with EtOH see (9); from chloroacetaldehyde ethyl alcoholate (chloroacetaldehyde ethyl-hemi-acetal) [Beil. I-611] in EtOH with dry HCl gas see (10); from α,β-dichloroethyl ethyl ether (3:5640) with 2 vols. abs. EtOH (2) or with NaOEt (11) (12) (13) see indic. refs.]

C̄ is comml. chem. in U.S. (1943) (14); C̄ is widely used in org. synthesis as source of combined chloroacetaldehyde (3:7212) and otherwise.

The acetal portion of C̄ is stable to alkali but readily hydrolyzed by aq. acids; the chlorine atom, however, behaves like a reactive alkyl halide; all these characteristics are illustrated in the reactns. cited below.

C̄ on warming with dil. H_2SO_4 yields (15) chloroacetaldehyde (3:7212) accompanied by some *bis*-(β-chloro-α-ethoxyethyl) ether, b.p. abt. 165°; C̄ on satn. at 100° with dry HCl gas yields (9) α,β-dichloroethyl ethyl ether (3:5640). — C̄ on htg. with AcOH at *120° or with anhydrous oxalic acid at 100–150° yields (12) chloroacetaldehyde (3:7212)* + ethyl acetate (1:3015) or diethyl oxalate (1:1055) respectively.

[C̄ htd. with NaOEt in s.t. at 140–150° for 30 hrs. (11) (13) (17) or with abs. alc. NaOEt at 160° under press. (16) gives (66% yield (16)) ethoxyacetaldehyde diethylacetal, b.p. 168° (11) (this prod. on boilg. with dil. H_2SO_4 (17) (13) (16) hydrolyzes to EtOH (1:6130) + ethoxyacetaldehyde (1:0159), b.p. 105–106°). — C̄ htd. with 10% excess of satd. abs. alc. KOH in s.t. for 75 hrs. gives (95% yield (18)) glycolaldehyde diethylacetal (hydroxyacetaldehyde diethylacetal) (1:0191), b.p. 167°.] [For reactn. of C̄ with many other alcs. (19) (20) and phenols (21) in pres. of alk. see indic. refs.]

[C̄ htd. with Na or Mg at *120–130°* (22) or with Na in ether at 0–20° (23) yields ethyl [illegible] ethoxyacetaldehyde diethylacetal [illegible]

[C̄ htd. with 4–5 vols. conc. aq. NH_4OH in s.t. at [illegible] for 12–14 hrs. (25) or C̄ [illegible] satd. alc. NH_3 in s.t. at 130° (26) (27) (28) or refluxed in pres. of NaI (29) yields aminoacetaldehyde diethylacetal [Beil. IV-308, IV_1-(449), IV_2-(758)], b.p. 163°. — C̄ htd. with alc. hydrazine hydrate under press. for 6 hrs. at 115–120° yields (30) hydrazinoacetaldehyde diethylacetal [Beil. IV-553].]

[C̄ with aniline + $NaNH_2$ in ether gives (77% yield (31)) *N*-(phenyl)aminoacetalde-

hyde diethylacetal [Beil. XII-213], b.p. 92–94° at 0 3 mm.; for corresp. behavior with benzylamine (32) or primary aliph. amines (33) see indic. refs.] — C̄ with 3 moles phenylhydrazine htd. several hrs. at 130° yields (34) glyoxal-*bis*-(phenylhydrazone), yel. tbls. from alc. or ether, m.p. 177° u.c., 179° cor. (34).

C̄ on acid hydrolysis (3) yields ethyl alcohol (1:6130) and chloroacetaldehyde (3:7212) q.v.

3:8230 4-CHLORO-OCTENE-4 $C_8H_{15}Cl$ Beil. S.N. 11

$$CH_3.CH_2\,CH_2.CH{=}\underset{|}{\overset{Cl}{C}}{-}CH_2.CH_2.CH_3$$

B.P. 157–159.5° at 750 mm. (1) **D_4^{25} = 0.8788 (1)** **n_D^{25} = 1.4394 (1)**

Although two geom. stereoisomers of C̄ are possible only this one has as yet been reported.

[For prepn of C̄ from octyne-4 (di-*n*-propylacetylene) (1·8110) with AcCl + $SnCl_4$ (both stereoisomers of 4-chloro-3-*n*-propylhepten-3-one-2 are also formed: *cis*, b.p. 117–118° at 28 mm., D_4^{25} = 0.9680, n_D^{25} = 1.4587; *trans*, b.p. 112–113° at 28 mm., D_4^{25} = 0.9592, n_D^{25} = 1.4601 (1)) see (1).]

3:8230 (1) Kroeger, Sowa, Nieuwland, *J. Org. Chem.* **1**, 163–169 (1936).

3:8235 *d,l*-α-ETHYL-*n*-VALERYL CHLORIDE $C_7H_{13}OCl$ Beil. II - 344

(*d,l*-2-Ethylpentanoyl chloride-1; ethyl-*n*-propyl-acetyl chloride)

$$CH_3.CH_2.CH_2.\underset{C_2H_5}{\underset{|}{CH}}\,.\,\underset{Cl}{\underset{|}{C}}{=}O$$

II₁—
II₂—

B.P. 158–160° (1)
50° at 11 mm. (2)

[For prepn. of C̄ from 2-ethylpentanoic acid-1 (ethyl-*n*-propyl-acetic acid) (1:1133) with PCl_3 (1) or $SOCl_2$ (2) see indic. refs.]

C̄ on hydrolysis yields ethyl-*n*-propyl-acetic acid (1:1133) q.v. (for the amide, anilide, *p*-toluidide, and other derivatives corresponding to C̄ see 1:1133).

3:8235 (1) Rasetti, *Bull. soc. chim.* (3) **33**, 687 (1905). (2) Reichstein, Trivelli, *Helv. Chim. Acta* **16**, 974 (1933); **15**, 258–259 (1932).

3:8240 2-CHLOROBUTEN-2-OL-1 (β-Chlorocrotonyl alcohol)

C_4H_7OCl Beil. I - 442, I_1—, I_2-(481)

B.P. 159° at 760 mm. (1)	$D_4^{23} = 1.0950$ (4)	$n_C^{23} = 1.45093$ (4)
158–161° (2)		
158.3° cor. at 742.5 mm. (3)	$D_4^{20} = 1.118$ (1)	$n_D^{20} = 1.46823$ (1)
52–53° at 19 mm. (4)		

Note: *cis* and *trans* stereoisomers of $\bar{C}$ are theoretically possible but have not definitely been reported.

[For prepn. of $\bar{C}$ from 2-chlorobuten-2-al-1 (α-chlorocrotonaldehyde) (3:8117) by reduction in abs. alc. with H_2 + $Al(OEt)_3$ (2) or with $Mg(OEt)_2.EtOMgCl$ (1) see (2) (1); for formn. of $\bar{C}$ (together with 3-chlorobuten-3-ol-2) (3:9115) from either the low-boilg (3:5360) or high-boilg. (3:5615) stereoisomer of 1,2-dichlorobutene-2 by hydrolysis with 2 pts. aq. + 1 mole $CaCO_3$ for 4 hrs. at 70° see (4); for prepn. of $\bar{C}$ from 2,2,3-trichlorobutanol-1 (3:1336) with Zn dust + HCl see (3).]

Ⓓ 2-Chlorobuten-2-yl-1 *N*-(α-naphthyl)carbamate: m.p. 95–96° (4).

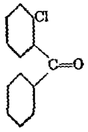
3:0715 2-CHLOROBENZOPHENONE (*o*-Chlorophenyl phenyl ketone)



$C_{13}H_9OCl$ Beil. VII - 419
VII_1-(227)

M.P. 46°	(1)	B.P. 330° (3) cor.	(4)
45.5–46°	(2)	185–188° at 13 mm.	(7)
45.5°	(3) (4) (5) (6) (8) (10)		
52–56°	(7)		

Tbls. from $CHCl_3$ + lgr. (3) (4); cryst. from pet. eth. (5). — [For crystallog. data see (5) (8).]

[For prepn. (93% yield (9)) from *o*-chlorobenzoyl chloride (3:6640) + C_6H_6 + $AlCl_3$ see (3) (5) (9); for formation (12%) in reaction of BzOH + chlorobenzene + $AlCl_3$ (main prod. 4-chlorobenzophenone (3:1914)) see (2).]

C̄ on reduction with 10% Na/Hg + alc. (11) or boilg. alc. KOH (12) gives almost exclusively 2-chlorodiphenylcarbinol [Beil. VI-680], m.p. 65° (11) (12), 62° (19). — C̄ with Al/Hg + 80% alc. (6) gives mainly 2-chlorodiphenylcarbinol (above) + a little 2,2'-dichlorobenzpinacol. — C̄ with Zn + AcOH (11) or C̄ in alc. on long exposure to sunlight (11) (13) (14) gives 2,2'-dichlorobenzpinacol [Beil. VI_1-(523)], m.p. 174–175° (6), 178° dec. (11).

C̄ htd. with aniline 3–4 hrs. at 200° yields (4) 2-chlorobenzophenone anil [Beil. XII-201], pale yel. ndls. or scales from alc., m.p. 128° (4). [Fused subst. or solns. in org. solvents (especially $CHCl_3$) are yellow.]

C̄ fused for 3 hrs. at 200° with a mixt. of KOH + NaOH gives (1) BzOH (1:0715) (90–95% yield) + chlorobenzene (3:7903) but no *o*-chlorobenzoic acid; however, C̄ with aq. NaOH + trace CuO in iron bomb (or in pres. of Fe powder) at 240° for 6 hrs. gives (58% yield (20)) fluorenone (1:9014).

C̄ with CH_3MgI yields (15) 1-(*o*-chlorophenyl)-1-phenylethylene, oil, b.p. 162–163° at 18 mm. (15); C̄ with Mg + MgI_2 easily loses nuclear halogen (16).

Ⓓ 2-Chlorobenzophenone oxime: from C̄ + $NH_2OH.HCl$ + dil. alc. KOH (5) (17) (7) or from C̄ + NH_2OH HCl + alc. htd. in s.t. for 3 hrs. at 130° (17); cryst. from pet. ether, m.p. 133–134° (17), 121° (5) (7). [With PCl_5 in dry ether, followed by aq. this oxime yields by Beckmann rearr. *o*-chlorobenzanilide [Beil. XII-266], m.p. 118° (5), 114° (17).] [The above oxime boiled with conc. aq. KOH for 1 day (5) or refluxed 6 hrs. with 20 pts. 30% MeOH/KOH, then diluted with aq. (17) (18), gives 3-phenylindoxazene [Beil. XXVII-71], ndls. or tbls. from ether or alc., m.p. 83–84° (18), 82.5° (5) (11).]

3:0715 (1) Lock, Rödiger, *Ber.* **72**, 867 (1939). (2) Newton, Groggins, *Ind. Eng. Chem.* **27**, 1398 (1935). (3) Overton, *Ber.* **26**, 28–29 (1893). companying p-isomer (3:8287) varies widely, e.g., from 100% C̄ with $PbCl_2 + NH_4OH$ (42), through 62% o/28% p with $PbCl_2$ (8), to 2.5 o/1 p via the electrolytic methods (40) (for details the orig. refs. must be consulted).] — [For sepn. of C̄ from polychlorotoluenes via const.-boilg. mixt. with aq. see (79).]

[For prepn. of C̄ from hydrazone of o-chlorobenzaldehyde (3:6410) by Wolff-Kishner reduction (35–82% yield) see (113).]

[For thermal anal. of system: C̄ + $SbCl_3$ see (48).]

[C̄ with H_2 in pres. of $Pd/CaCO_3$ in alc./alk. soln. loses all its chlorine as HCl (49); C̄ with HI + P at 302° for 5 hrs. gives 80% yield (50) toluene (1:7405).]

C̄ on oxidn. with CrO_3 is completely destroyed (30); C̄ on oxidn. with boilg. aq. $KMnO_4$ (74–78% yield (51)) (52) (36) (53) or C̄ on cat. oxidn. with air over granular tin vanadate at 287° (13.8% yield (54)) cf. (55) or C̄ + KCN + $NiCl_2$ in dil. alc. 20 hrs. at 260–270° (7.5% yield (63)) gives o-chlorobenzoic acid (3:4150); C̄ with CrO_2Cl_2 followed by aq. (51.5% yield (56)) (57) or C̄ on oxidn. with Ce cpds. (58) or with air over Ta_2O_5 (59) cf. (60) or C̄ with $MnO_2 + H_2SO_4$ (61) or PbO_2 + dil. H_2SO_4 (24% yield (62)) gives o-chlorobenzaldehyde (3:6410).

[C̄ with Cl_2 in pres. of Al/Hg gives (64) a mixt. contg. 2,3- (3:6345), 2,4- (3:6290), 2,6- (3:6270), together with some 2,5-dichlorotoluene (3:6245). — C̄ with Cl_2 + 3% PCl_3 in light gives (65) (19) o-chlorobenzyl chloride (3:6400); C̄ with $Cl_2 + PCl_5$ at 150–180° (66) (67) (68) cf. (70) gives o-chlorobenzal (di)chloride (3:6625); C̄ with $Cl_2 + PCl_3$ (73) or with Cl_2 at 160–190° (69) gives (64% yield (69)) (70) (71) o-chlorobenzotrichloride (3:6880).]

[C̄ with Br_2 in pres. of Al/Hg in CCl_4 gives (74) mainly 5-bromo-2-chlorotoluene [Beil. V-307, V_1-(155)], together with a smaller amt. of 4-bromo-2-chlorotoluene [Beil. V-307, V_1-(155)]; the former is also obtd. (75) from C̄ + $Br_2 + HNO_3 + H_2SO_4$ in AcOH. — C̄ with Br_2 (76) (77) yields o-chlorobenzyl bromide [Beil. V_1-(155)] (for studies of rate of side-chain bromination of C̄ see (78)).]

[C̄ + $I_2 + HNO_3 + H_2SO_4$ in AcOH gives (75) 2-chloro-5-iodotoluene [Beil. V-315]]

[C̄ with $AlCl_3$ + HCl gas as directed (7) undergoes partial rearr. to both m-chlorotoluene (3:8275) and p-chlorotoluene (3:8287); for anal. of mixts. of the three isomers see (7).]

[C̄ with AcCl (80) or better Ac_2O (81) + $AlCl_3$ gives (70% yield (81)) 4-chloro-3-methylacetophenone [Beil. VII-307], b.p. 254.2–254.4° at 753.4 mm., n_D^{25} = 1.5521 (81). — C̄ with β-chloropropionyl chloride (3:5690) + $AlCl_3$ in CS_2 gives (68% yield (82)) (83) 2-chloro-5-(β-chloropropionyl)toluene, colorless pr. from C_6H_6, m.p. 46° (82), which on ring closure with conc. H_2SO_4 gives (82) (83) 6-chloro-7 (or 5)-methylindanone-1, cryst. from alc., m.p. 74–75° (82) (83). — C̄ with trichloroacetonitrile + $AlCl_3$ (4 moles) at 80–90° satd. with HCl gas for 2 days gives (40% yield (84)) 4-chloro-3-methyl-ω,ω,ω-trichloroacetophenone, b.p. 155–160° at 11 mm. (84). — C̄ with fumaryl (di)chloride + $AlCl_3$ in CS_2 at 50–60° for 2 hrs. gives (51% yield (85)) *trans-bis*-1,2-(4-chloro-3-methylbenzoyl) ethylene, pale yel. cryst. from alc., m.p. 167° (85).]

[C̄ with benzoyl chloride + $AlCl_3$ gives (83% yield (86)) 3-chloro-4-methylbenzophenone [Beil. VII_1-(236)], lfts. from alc., m.p. 82–83° (86); C̄ with o-chlorobenzoyl chloride (3:6640) + $AlCl_3$ in CS_2 for 12 hrs. gives (87) 2′,3-dichloro-4-methylbenzophenone, cryst. from alc., m.p. 43.5° (87). — C̄ with naphthalene-*bis*-1,4(or 5)-(dicarboxylic acid dichloride) + $AlCl_3$ gives (88) *bis*-1,4(or 5)(chlorotoluoyl)naphthalene (used for ring closure to corresp. dibenzpyrenequinones).]

[C̄ with phthalic anhydride + $AlCl_3$ at 90° gives (89) (90) (91) a mixt. (93% yield (90)) of two o-(chlorotoluoyl)benzoic acids A + B: A, m.p. 183–184° (90), 182–183° (91) (89), the main prod., is regarded variously as either (90) o-(3-chloro-4-methylbenzoyl)benzoic acid or (91) o-(4-chloro-3-methylbenzoyl)benzoic acid but in any case with conc. H_2SO_4

ring-closes to give (92% yield (90)) (91) 2-chloro-3-methylanthraquinone, colorless tbls. from toluene, m.p. 219° (91) cor. (90); B, m.p. 176–177° (91), the minor prod., regarded (91) as *o*-(2-chloro-3-methylbenzoyl)benzoic acid, with conc. H_2SO_4 ring-closes to give 1-chloro-2-methylanthraquinone, yel.-br. ndls. from toluene, m.p. 171° (91), 170–171° (90).] — [For reactn. of $\bar{C}$ with 3,4-dichlorophthalic anhydride (3:3695) (92) or with pyromellitic anhydride (93) see indic. refs.]

[$\bar{C}$ with aq. NaOH in pres. of Cu at 350–360° under press. yields (94) a mixt. contg. 41% *o*-cresol (1:1400) + 59% *m*-cresol (1:1730) (for extensive study of hydrolysis of $\bar{C}$ as means of prepn of *m*-cresol (1:1730) see (112)); $\bar{C}$ with NH_3 + cat. under press. as directed (95) (96) (97) yields *o*-toluidine (for behavior of $\bar{C}$ with liquid NH_3 see (98)). — $\bar{C}$ with aniline + Cu at 175° yields (99) phenyl-*o*-tolylamine. — $\bar{C}$ with diphenylamine + K at 240–245° in H_2 gives (by rearr.) (100) *N,N*-diphenyl-*m*-toluidine, m.p. 69–70°.] — [Note that $\bar{C}$ does not react with aq. sodium sulfanilate + Na_2CO_3 (dif. from benzyl chloride (3:8535)) and use in sepn. of $\bar{C}$ from the latter (8).]

[$\bar{C}$ on mononitration, e.g., with 4 pts. HNO_3 ($D = 1.52$) at 0° (101) gives a mixt. contg all four possible isomers, viz., 43% 2-chloro-5-nitrotoluene [Beil. V-329, V_1-(163)], m.p. 42.9° (101), 44° (102), 21% 2-chloro-6-nitrotoluene [Beil. V-327, V_1-(162)], m.p. 35.3° (101), 37° (103) (104), 19% 2-chloro-3-nitrotoluene [Beil. V-328, V_1-(163)], m.p. 22.1° (101), 21.5° (105), and 17% 2-chloro-4-nitrotoluene [Beil. V-329, V_1-(163)], m.p. 62.3° (101), 65° (105A).]

$\bar{C}$ on dinitration, e.g., with mixt. of 3 wt. pts. HNO_3 ($D = 1.48$) + 9 wt. pts. conc H_2SO_4 at 100° (106), or with 2 vol. pts. HNO_3 ($D = 1.42$) + 5 vols. pts. conc. H_2SO_4 at 100° as directed (107), gives mainly (55–60% (107)) 2-chloro-3,5-dinitrotoluene [Beil. V-345, V_1-(169)], cryst. from alc., m.p. 64° (107), 63–64° (106), accompanied by smaller amts. of three isomers, viz., 2-chloro-4,5-dinitrotoluene, m.p. 88.5° (18–20% (107)), 2-chloro-5,6-dinitrotoluene, m.p. 106.5° (18–20% (107)), and 2-chloro-4,6-dinitrotoluene, m.p. 49° (1–2% (107)) [*the two other possible dinitro-2-chlorotoluenes have been prepd.* by indirect means, viz., 2-chloro-3,4-dinitrotoluene, m.p. 89° (108), and 2-chloro-3,6-dinitrotoluene, m.p. 62–63° (109)].

[$\bar{C}$ on monosulfonation with fumg. H_2SO_4 (37) or 100% H_2SO_4 (23) (8) or $ClSO_3H$ (110) (see below) yields 2-chlorotoluenesulfonic acid-5 [Beil. XI-95]; $\bar{C}$ sulfonates more readily (8) than *p*-chlorotoluene (3:8287) and may thus be used to separate $\bar{C}$ from the latter (8) (111).]

Ⓓ **2-Chlorotoluenesulfonamide-5 (4-chloro-3-methylbenzenesulfonamide-1):** cryst. from dil. alc., m.p. 126° u.c. (110). [From $\bar{C}$ with $ClSO_3H$ as directed (110) followed by conv. of the intermediate 2-chlorotoluenesulfonyl chloride-5, cryst. from pet. ether, m.p. 63° u.c. (110), with $(NH_4)_2CO_3$.]

B.P. 160° at 764 mm. (1)

[For prepn. of Č from α-chloro-*n*-valeronitrile with MeOH + H_2SO_4 see (1).]

3:8264 (1) Henry, *Bull. acad. roy Belg.* (3) **36**, 241–262 (1898); *Cent.* **1898**, I 194.

[For study of system: $\bar{C}$ + $SbCl_3$ see (7).]

[$\bar{C}$ with NH_3 + cat. as directed (34) (35) yields *m*-toluidine; $\bar{C}$ with aq. NaOH in pres. of Cu at 300–400° under press. yields (51) mixt. of *o*-cresol (1:1400), *m*-cresol (1:1730), and *p*-cresol (1:1410).]

[$\bar{C}$ on mononitration, e.g., with 4 pts. HNO_3 (D = 1.52) at 0°, gives a mixt. contg. (36) cf. (37) (13) (38) 59% 3-chloro-6-nitrotoluene [Beil. V-327, V_1-(162)], m.p. 24.9°, + 32% 3-chloro-4-nitrotoluene [Beil. V-329, V_1-(163)], m.p. 24.2°, + 9% 3-chloro-2-nitrotoluene [Beil. V-327, V_1-(162)], m.p. 23.4°. — $\bar{C}$ on dinitration, e.g., with mixt. of 2 wt. pts. HNO_3 (D = 1.52) + 3 wt. pts. conc. H_2SO_4 at room temp. for 12–18 hrs. (13), gives (95.8% yield (13)) 3-chloro-4,6-dinitrotoluene [Beil. V-344, V_1-(168)], cryst. from alc. or lgr., m.p. 91° (13) (38) (39), 90–90.5° (52) (note that the isomeric 3-chloro-2,6-dinitrotoluene [Beil. V_1-(168)] (40), m.p. 77° (40), and 3-chloro-2,4-dinitrotoluene, m.p. 92° (41), are also known but prepd. by indirect means). — $\bar{C}$ on trinitration, e.g., by refluxing with 3 pts HNO_3 (49.4°Bé) + 3 pts. H_2SO_4 (66°Bé) at 160° (42), yields 3-chloro-2,4,6-trinitrotoluene [Beil. V-349], cryst. from C_6H_6 + lgr., m.p. 150–151° (52), 148.5° (42).]

[$\bar{C}$ with Na followed by CO_2 as directed gives (yields: 88% (43A), 58% (43B)) *m*-toluic acid (1:0705), m.p. 110–111°, also obtd. in small yield (44) from $\bar{C}$ + alc. KCN in pres. of $NiCl_2$, htd. in s.t. at 260–270° for 20 hrs.]

[$\bar{C}$ with CrO_2Cl_2 gives a cpd. which with aq. gives (44.5% yield (45)) *m*-chlorobenzaldehyde (3:6475).]

$\bar{C}$ on oxidn. with $K_2Cr_2O_7$ + H_2SO_4 (14), with 5% aq. $KMnO_4$ (11) (46) or with dil. HNO_3 in s.t. at 130–140° for 10 hrs. (15) gives (75% yield (46)) *m*-chlorobenzoic acid (3:4392).

Ⓓ **3-Chloro-6-sulfonamidotoluene (4-chloro-2-methylbenzenesulfonamide)**: cryst. from dil. alc., m.p. 184–185° u.c. (47). [From $\bar{C}$ with $ClSO_3H$ as directed (47) followed by treatment of the resultant 4-chloro-2-methylbenzenesulfonyl chloride, cryst. from pet. eth., m.p. 52–53° u.c. (47), 54° (49) with $(NH_4)_2CO_3$.]

[For prepn. of C̄ from *m*-toluidine [Beil. XII-853, XII_1-(397)] via diazotization and use of Cu_2Cl_2 reactn. (yields: 86% (46), 80% (11)) (12) (13) or CuH (35% yield (48)) see indic. refs., from 3-chloro-4-aminotoluene [Beil. XII-989, XII_1-(436)] via diazotization followed by boilg. with alc. (60% yield (14)) or conversion to corresp. hydrazine and subsequent oxidn. with $CuSO_4$ (50% yield (15)) see indic. refs.; from 5-chloro-2-aminotoluene [Beil. XII-835] with alc. H_2SO_4 + ethyl nitrite (1) or by diazotization, reduction to the corresp. hydrazine, and oxidn. of latter with $CuSO_4$ (43–63% yield (15)) see indic. refs.: for formn. of C̄ from 1-methylcyclohexanone-3 by conversion with PCl_5 to 3-chloro-1-methylcyclohexene-*x*, treatment with Br_2, and boilg. with quinoline see (16); from 3-chloro-1-methylcyclohexadiene-1,3 [Beil. V-116] by conv. to dibromide and boilg. with quinoline see (17), from *m*-cresol (1:1730) with PCl_5, or from tri-(*m*-tolyl) phosphate at 210° see (18): for study of formn. of C̄ by partial rearr. with $AlCl_3$ of *o*-chlorotoluene (3:8245) or *p*-chlorotoluene (3:8287) see (2).]

[C̄ with H_2 in pres. of $Pd/CaCO_3$ in alc./alk. soln. loses all its chlorine as HCl (19); C̄ with H_2 in pres. of Pt in AcOH loses HCl, but no quant. data are given (20).]

[C̄ with Cl_2 in pres. of Al/Hg yields (21) both 2,5-dichlorotoluene (3:6245) and 3,4-dichlorotoluene (3:6355) but no trace of any other isomers.]

[C̄ with Br_2 in CCl_4 at 60–80° in bright light (22) (23) or in CS_2 (23) or C̄ at 130° with Br_2 directly (24) gives (55% yield (22)) *m*-chlorobenzyl bromide, m.p. 15–15.5°, b.p. 103–105° at 8 mm. (22), b.p. 108–111° at 10 mm (24), D_{25}^{25} = 1.5652 (22); C̄ with Br_2 in CCl_4 in pres. of Al/Hg (25) or C̄ with Br_2 in AcOH in pres. of HNO_3 or HNO_3/H_2SO_4 (26) gives both 6-bromo-3-chlorotoluene, b.p. 120–125° at 15 mm. (26), 100–103° at 15 mm. (25) (note disagreement!), and 4-bromo-3-chlorotoluene, b.p. 90–93° at 12 mm. (26).] — [C̄ with Br_2 in pres. of Be yields (27) *x*,*y*-dibromo-3-chlorotoluene, m.p. 96.5°.]

[C̄ with $AlCl_3$ + HCl gas as directed undergoes partial rearr. (2) to both *o*-chlorotoluene (3:8245) and *p*-chlorotoluene (3:8287), for anal. of mixtures of the three isomers see (2).]

[C̄ with AcCl + $AlCl_3$ in CS_2 gives (60% yield (28)) 3-chloro-4-acetyltoluene (2-chloro-4-methylacetophenone), b.p. 260–262° at 760 mm. (28), b.p. 120–126° at 14 mm (29), accompanied (29) by some of the isomeric 3-chloro-6-acetyltoluene (4-chloro-2-methylacetophenone), b.p. 120–122° at 14 mm. (29). — C̄ with chloroacetyl chloride (3:5235) + $AlCl_3$ in CS_2 gives (70% yield (33)) 3-chloro-6-(chloroacetyl)toluene (ω,4-dichloro-2-methylacetophenone, m.p. 90° (33). — C̄ with β-chloropropionyl chloride (3:5690) + $AlCl_3$ in CS_2 gives (87% yield (50)) (30) 3-chloro-6-(β-chloropropionyl)toluene which on ring closure with conc. H_2SO_4 gives (50) (30) 5-chloro-7-methylindanone-1, m.p. 71° (50) (30). — C̄ with biphenyl-4,4′-*bis*-(carboxylic acid chloride) + $AlCl_3$ yields (31) 4,4′-*bis*-(4-chloro-2-methylbenzoyl)-biphenyl (used in prepn. of *bis*-anthraquinonyl derivs.).]

[C̄ with trichloroacetonitrile + $AlCl_3$ as directed (32) yields 4-chloro-2-methylbenzoic acid (3:4700).]

[Other reactns. involving only the OH group of $\bar{C}$ include the following: $\bar{C}$ with acetylene + BF_3 + HgO gives (38% yield (30)) ethylidene *bis*-(γ-chloro-*n*-propyl)acetal, b.p. 127–129° at 14 mm. (30); $\bar{C}$ with benzonitrile + HCl gas in ether gives (31) γ-chloro-*n*-propyl iminobenzoate hydrochloride; $\bar{C}$ with β-acetobromglucose + Ag_2CO_3 yields (32) tetra-acetyl-β-*d*-(γ-chloro-*n*-propyl)glucoside, m.p. 74° (for extension to prepn. of corresp. xyloside, galactoside, and lactoside see (32)).]

[$\bar{C}$ with solid KOH loses HCl on htg. giving (16) (7) (10) (1) 1,3-epoxypropane (trimethylene oxide) [Beil. XVII-6, $XVII_1$-(3)], b.p. 47.8° at 760 mm., $D_4^{25} = 0.8930$, $n_D^{24} = 1.3897$ (16) (for study of rate of reactn. see (33)).]

[$\bar{C}$ with NaOEt in abs. alc. reacts vigorously giving (38% yield (34)) ethyl γ-hydroxy-*n*-propyl ether (trimethylene glycol monoethyl ether) [Beil. I-476, I_1-(247)], b.p. 160–161° (34), *162.1–162.2°*, $D_4^{20} = 0.91691$, $n_D^{20} = 1.41666$ *(35)*, accompanied by some trimethylene glycol diethyl ether, b.p. 140° (34). — $\bar{C}$ with NaSH as directed gives (70–80% yield (34)) γ-hydroxy-*n*-propyl mercaptan, b.p. 85–90° at 15 mm. (Hg mercaptide = Hg ($SCH_2CH_2CH_2OH)_2$, pl. from butanol, m.p. 132–134° (36). — $\bar{C}$ with aq. Na_2S gives (36) *bis*-(γ-hydroxy-*n*-propyl) sulfide, visc. oil which could be neither distd. nor crystd. but which with phenyl isocyanate gave the corresp. *bis*-(phenylcarbamate), m.p. 146–148° (36). — $\bar{C}$ with $NaSCH_3$ in ether gives (76% yield (42)) γ-hydroxy-*n*-propyl methyl sulfide, b.p. 105–105.5° at 30 mm. (42). — $\bar{C}$ with benzyl mercaptan in alc. gives (88% yield (43)) benzyl γ-hydroxy-*n*-propyl sulfide, b.p. 185° at 19 mm. (43).]

[$\bar{C}$ in alk. medium reacts with phenols yielding corresp. subst. alcohols; e.g., $\bar{C}$ with phenol + alc. NaOEt (75% yield (37)) or $\bar{C}$ + phenol + aq. NaOH (80% yield (38) (39)) gives 3-phenoxypropanol-1, b.p. 158–160° at 25 mm., $n_D^{20} = 1.491$ (37) which with $ZnCl_2$ at 215° loses aq. and ring-closes (37) to chromane [Beil. XVII-52, $XVII_1$-(22)]; for corresp. reactn. with *o*-cresol (40), with *m*-cresol (41), *p*-cresol (41), β-naphthol (40), or resorcinol (40) see indic. refs.]

[$\bar{C}$ with prim. or sec. amines splits out HCl yielding corresp. subst. aminoalcohols: e.g., for reactn. of $\bar{C}$ with aniline + anhydrous Na_2CO_3 giving (67.5% yield) 3-(*N*-phenylamino)propanol-1 (*N*-(γ-hydroxy-*n*-propyl)aniline), b.p. [illegible] at 30 mm., $D_{26}^{26} = 1.063$,

for $\bar{C}$ with *ac*-

sec. amines see

(47) (55); for $\bar{C}$ with morpholine giving (75% yield) 3-(morpholino)propanol-1, b.p. 147–149° at 21 mm., $n_D^{25} = 1.4743$, $n_D^{20} = 1.4762$, see (76); for $\bar{C}$ with piperidine see (48) (56).] — [$\bar{C}$ with *ter*-amines yields corresp. quat. ammon. salts: e.g., $\bar{C}$ with $(CH_3)_3N$ in C_6H_6 in s.t. at 100° for 8 hrs. gives (92% yield (49)) γ-homocholine chloride, m.p. 173° (49); $\bar{C}$ with pyridine gives (85% yield (50)) γ-hydroxy-*n*-propyl pyridinium chloride, oil.] — [For reactn. of $\bar{C}$ with arsanilic acid (*p*-aminobenzenearsonic acid) (51), with *p*-hydroxybenzenearsonic acid (52), with ethyl β-methylaminopropionate (53), or with various carbazole derivs. (54) see indic. refs.]

[$\bar{C}$ with 1 mole thiourea htd. at 120–125° yields (57) *S*-(γ-hydroxy-*n*-propyl)isothiourea hydrochloride, cryst. from butanol, m.p. 130° (57); $\bar{C}$ with dry sodium *p*-toluenesulfonamide htd. at 160–170° for 18 hrs. yields (58) *N*-(γ-hydroxy-*n*-propyl)-*p*-toluenesulfonamide as an oil.]

[For study of rate of reactn. of $\bar{C}$ with KI in acetone at 35° and 45° see (39); for reactn. of $\bar{C}$ with Na_3AsO_3 see (5).]

—— γ-Chloro-*n*-propyl acetate [Beil. II_1-(48), II_2-(139)]: liq., b.p. 168–169° (59), 165–166° (60), 88–90° at 22 mm. (61), 66° at 14 mm. (17), 62–63° at 10 mm. (7) $D_{21}^{21} = 1.1105$ (7); $n_D^{21} = 1.431$ (7). [From $\bar{C}$ + AcCl (yields: 90% (60), 87% (16)) (7) (62), from 1,3-dichloropropane (3:5450) with AgOAc (53% yield (61)), or from

45–46° (1)

[For prepn. of Č from 2,2'-dichlorobenzilic acid (1) by oxidn. with CrO_3/AcOH (47% yield (1)) or from di-(*o*-chlorophenyl)carbinol (1) by oxidn. with $Na_2Cr_2O_7/H_2SO_4$/AcOH see indic. refs.]

Ⓓ 2,2'-Dichlorobenzophenone 2,4-dinitrophenylhydrazone: m.p. 206–208° (1).

3:0717 (1) Haller, Bartlett, Drake, Newman, Cristol et al., *J. Am. Chem. Soc.* **67**, 1600–1601 (1945).

3:0720 ETHYLENE GLYCOL *bis*-CHLOROACETATE $C_6H_8O_4Cl_2$ Beil. S.N. 160

$ClCH_2.CO.O.CH_2$
$ClCH_2.CO.O.CH_2$

M.P. 45–46.5° (1) B.P. 142–144° at 2 mm. (1)

Cryst. from ether/pet. eth. — Insol. aq. (dif. from β-hydroxyethyl chloroacetate (3:6780)).

[For prepn. of Č from ethylene oxide (1:6105) with chloroacetic acid (3:1370) as by-product of prepn. of β-hydroxyethyl chloroacetate (3:6780) see (1); note also that Č is formed (together with ethylene glycol (1:6465)) by disproportionation of β-hydroxyethyl chloroacetate (3:6780) on long stdg. in ord. glass bottles (1).]

Č on shaking with aq. is hydrolyzed only very slowly (1).

[For use of Č as insecticide, fungicide, and disinfectant see (2).]

3:0720 (1) Meerwein, Sönke, *J. prakt. Chem.* (2) **137**, 316–318 (1933). (2) Peet (to Rohm and Haas Co.), U.S. 1,816,441, July 28, 1931; *Cent.* **1932**, I 1146; *C.A.* **25**, 5501 (1931); French 667,633, Oct. 18, 1929; *Cent.* **1930**, I 2614.

trimethylene glycol (1:6490) with Ac_2O + S_2Cl_2 (68% yield (17)).] — [This acetate with solid KOH loses HOAc giving (16) (7) (61) 2,3-epoxypropane (trimethylene oxide) (see above).]

—— γ-*Chloro-n-propyl benzoate*: oil, b.p. 154–156° at 22 mm. (31), 155–156° at 15 mm. (4), 133–134° at 2 mm. (39), D_4^{22} = 1.1672 (31), n_D^{20} = 1.5136 (31). [From C̄ + BzCl (yields: 84% (39), 75% (4)) or from γ-chloro-n-propyl iminobenzoate hydrochloride (see above) by hydrol. (31).] — [For reactn. of this ester with pyrrolidine (63), pyrroline (63), piperidine (56), subst. piperidines (64) (65) (68), hydrogenated quinolines (66), or with *N*-methyl-phenyl-alkylamines (67) see indic. refs.]

—— γ-*Chloro-n-propyl p-nitrobenzoate*: oil, b.p. 168.5–169.5° at 2 mm., D_{25}^{25} = 1.3222, n_D^{25} = 1.54736 (67). [From C̄ + *p*-nitrobenzoyl chloride on htg. (67).]

Ⓓ γ-Chloro-n-propyl 3,5-dinitrobenzoate: colorless pl. from lt. pet., m.p. 77° (17). [From C̄ + 3,5-dinitrobenzoyl chloride (17).]

—— γ-Chloro-n-propyl hydrogen phthalate: unreported.

—— γ-Chloro-n-propyl hydrogen 3-nitrophthalate: unreported.

—— γ-*Chloro-n-propyl benzenesulfonate*: unreported.

—— γ-Chloro-n-propyl *p*-toluenesulfonate: oil, b.p. 216–219° at 17 mm. (69), 188–192° at 5 mm (24), D_4^{20} = 1.2674 (69), D_{25}^{25} = 1.2396 (24), n_D^{20} = 1.5230 (69), n_D^{21} = 1.5225 (24). [From C̄ + *p*-toluenesulfonyl chloride on htg. (69) or with aq. NaOH at 15° (50–55% yield (24)).] — [For reactn. of this ester with RMgX cpds. see (69) (24), with various sodium acetylenes see (70).]

—— γ-*Chloro-n-propyl carbamate*: *pearly cryst. from hot. aq., m.p. 62° (29).* [From C̄ with urea nitrate (2 moles) on htg. at 130–135° (16% yield (29)) or from γ-chloro-n-propyl chloroformate (3:6010) with conc. aq. NH_4OH (29).]

—— γ-Chloro-n-propyl *N*-(phenyl)carbamate: ndls. from alc., m.p. 38° (29), m.p. 35–36° (28), b.p. 190° at 3.5 mm. (28). [From C̄ + phenyl isocyanate at 150° (29) or from γ-chloro-n-propyl chloroformate (3:6010) with aniline (29).]

—— γ-*Chloro-n-propyl N-(p-nitrophenyl)carbamate*: *unreported.*

Ⓓ γ-Chloro-n-propyl *N*-(α-naphthyl)carbamate, cryst. from hot lgr., m.p. 76° (71) (17), 76.5° (9), 75.5–76.5° (28). [From C̄ + α-naphthyl isocyanate (71).]

Ⓓ *N*-(γ-Hydroxy-n-propyl)phthalimide [3-(*N*-phthalimido)propanol-1] [Beil. XXI-472]: cryst. from aq., m.p. 75° (72), 74° (73), 88° (74). [From C̄ + K phthalimide at 190° (73); also indirectly as cited in other indicated refs.]

Ⓓ *N*-(γ-Hydroxy-n-propyl)tetrachlorophthalimide [3-(*N*-tetrachlorophthalimido)propanol-1)]: pr. from acetone, m.p. 165–166° (75). [From C̄ with K tetrachlorophthalimide as directed (75).]

See also Note 4.

See also Note 1.

Note 1. For further data on b.p. of $\bar{C}$ at 16 pressures from 74–764 mm. see (4).

Note 2. For effect of press on m.p see (20).

Note 3. For data on D_4^t from $t = 25°$ to $t = 160°$ see (16) (4); note also $D_{20}^{20} = 1.0714$ (8).

Note 4. For n_D^{19}/compn. data on system: $\bar{C}$ + o-chlorotoluene (3:8245) see (22).

$\bar{C}$ with aq. forms a const.-boilg mixt., b.p. 95° (use in sepn. of $\bar{C}$ from polychlorotoluenes (23)). — For f p./compn. data on system: $\bar{C}$ + o-chlorotoluene (3:8245) (eutectic, f.p. −49 8°, contg. 27 wt % $\bar{C}$) see (8) (147); for D_{20}^{20}/compn. data (8) and for n_D^{19}/compn. data (22) on this system see indic. refs. — For f p /compn. data on systems of $\bar{C}$ with *p-bromotoluene* or with *p-fluorotoluene* see (19). — For data on const.-boilg. mixts. of $\bar{C}$ with various org cpds see Beil. V_2-(227). — For cryoscopic constant (i e., lowering of f.p. per mole solute per 1000 g $\bar{C}$) viz , 5 53 (12), 5 6 (24), 5 97 (25), see indic. refs.; for use in detn of $\bar{C}$ in mixt. with o-chlorotoluene (3:8245) and m-chlorotoluene (3:8275) see (25).

[For prepn. of $\bar{C}$ from p-toluidine via diazotization in HCl and warming the resultant solution as such (yields: 60% (26), 40–44% (27)) (28) or in pres. of Cu_2Cl_2 (yields: 95% (33), 88–89% (29), 81% (31), 70–79% (30), 63.5% (32)) [for study of kinetics of this reaction see (34) (35)], or in pres of Cu powder (63.8% yield (36)), or in pres. of CuH (64% yield (37)), or by electrolysis between Cu electrodes in pres. of $CuCl_2$ (38) see indic. refs.; for prepn. of $\bar{C}$ from p-toluidine via diazotization, conversion to solid p-toluenediazonium chloride, and subsequent warming with C_6H_6 + $AlCl_3$ (39), or via diazotization, conversion of diazonium salt to its cpd. with $PbCl_4$, and subsequent htg. of latter in naphthalene at 150° (40), see indic. refs.]

[For formn. of $\bar{C}$ (usually together with other prods) from toluene (1:7405) with Cl_2 (70) in pres. of Fe in diffuse light in cold (8) (gives mixt. contg. 42% $\bar{C}$ + 58% o-chlorotoluene (3:8245) (8) (22)), or in pres. of I_2 (22) (41) (42), or in pres. of $PbCl_2$ (8), $SbCl_5$ (41), $MoCl_5$ (43) (28) (44), or Al/Hg (45); for formn of $\bar{C}$ from toluene by electrolysis in strong HCl (46) or in AcOH/conc. HCl in dark (47) see indic. refs.; for formn. of $\bar{C}$ from toluene with SO_2Cl_2 at 160° (48), with SO_2Cl_2 in pres. of various cat. in dark (49), with SO_2Cl_2 + $AlCl_3$ + S_2Cl_2 at 70° (50), with pyrosulfuryl chloride + $AlCl_3$ at 0° (51), with HCl + HNO_3 at 100° (52), with n-butyl chlorosulfonate + $AlCl_3$ (6 2% yield (53)), with anhydrous $FeCl_3$ after refluxing 1½ hrs. (65% yield (54)), or with NCl_3 (55) see indic. refs.]

[For formn. of $\bar{C}$ from o-chlorotoluene (3:8245) or m-chlorotoluene (3:8275) by partial rearr. with $AlCl_3$ + HCl gas see (25); from tetra-(p-tolyl)tin with Cl_2 in $CHCl_3$ (85% yield (6)) or from tri-(p-tolyl) stibine dichloride on htg. under 5–7 mm. press. at 60–65° (56) (note that at 160–200° di-p-tolylstibine chloride is formed (56)) or from tri-(p-tolyl)-phosphite dichloride by htg at 200–210° (57) see indic. refs.; from p-tolyl MgBr in ether with Cl_2 (58) or with benzenesulfonyl chloride (59) see indic. refs.; from p-toluenediazopiperidide with conc. HCl see (60); from p-chlorobenzaldehyde (3:0765) on elec. reduction in acid soln. with Cu cathode see (61); from chlorobenzene (3:7903) via condensation with CH_2O + HCl to p-chlorobenzyl chloride (3:0220) and subsequent reductn. with Zn + NaOH see (62)]

[C̄ on pyrolysis over red-hot Pt yields (63) mainly 4,4′-dichlorodibenzyl (1,2-*bis*-(*p*-chlorophenyl)ethane [Beil. V-600, V_1-(281), V_2-(507)], colorless lfts. from alc., m.p. 112°, accompanied by a very small amt. 4,4′-dichlorostilbene (1,2-*bis*-(*p*-chlorophenyl)ethylene) [Beil. V_1-(304), V_2-(539)], ndls. from alc., m.p. 170°.]

[C̄ with H_2 in pres. of $Pd/CaCO_3$ (64) or reduced Ni (65) in alc./alk. soln. loses all its halogen as HCl; C̄ with Na in liq. NH_3 as directed (66) yields toluene and other prods.; C̄ with HI + P in s.t. at 302° for 5 hrs. gives (80% yield (67)) toluene.]

C̄ on oxidn. with 3 pts. $KMnO_4$ in dil. aq. soln. under reflux for 4–5 hrs. (68) (51), or with CrO_3 (42), or with dil. HNO_3, e g., with 6 pts. of dil. HNO_3 (1 vol. conc. HNO_3 + 2 vols. aq.) at 145° for 1½ hrs. (69) or at 115–120° for 5–6 hrs. (70), yields *p*-chlorobenzoic acid (3:4940), m.p. 243° (for use in quant. estn. of C̄ in pres. of toluene, benzyl chloride, and *o*-chlorotoluene see (70)). — Note that with HNO_3 C̄ is more rapidly oxidized than *o*-chlorotoluene, *m*-chlorotoluene, or the various dichlorotoluenes but more slowly than *p*-bromotoluene (69). — C̄ on oxidn. with air at 260° in pres. of Na_2CO_3 and under press. (71), or on vapor-phase oxidn. over suitable cat. (72), or on electrolytic oxidn. in dil. Na_2CO_3 soln. at 60° (73) cf. (74), or even on very long stdg. (2 years) with I_2 + aq. in sunlight (75) gives *p*-chlorobenzoic acid. — C̄ with N_2O_4 yields (76) *p*-chlorobenzoic acid accompanied by nitration prods.

[C̄ with chromyl chloride (CrO_2Cl_2) yields an addn. prod. which with aq. gives in good yield (77) *p*-chlorobenzaldehyde (3:0765). — C̄ with air in aq. susp. of FeO.OH + cat. at 235–240° and 50–60 atm. press. gives (78) a mixt. of *p*-chlorobenzaldehyde (3:0765) + *p*-chlorobenzoic acid (3:4940).]

[C̄ with Cl_2 or on htg. with $PbCl_4.2NH_4Cl$ or with SO_2Cl_2 in pres. of dibenzoyl peroxide in dark yields *p*-chlorobenzyl chloride (3:0220), q.v. for relevant refs. — C̄ with 2 moles Cl_2 in pres. of 5% PCl_5 at 160–170° gives (79) (80) *p*-chlorobenzal (di)chloride (3:6700). — C̄ with 3 moles Cl_2 at high temp. in u.v. light (81) cf. (82) or with 3 moles Cl_2 (83) in pres. of $FeCl_3$ (84) or of PCl_5 (85) (86) gives (93% yield (85)) *p*-chlorobenzotrichloride (3:6825) q.v. — C̄ with Cl_2 (1 mole) in pres. of 1% Fe or 40% $PbCl_2$ at 20° gives (65% yield (87)) a mixt. comprising 58.4% 2,4-dichlorotoluene (3:6290) + 41.6% 3,4-dichlorotoluene (3:6355).]

[C̄ with Br_2 at 130° (88) or at 160° (89) (90) or in pres. of dibenzoyl peroxide in dark at 100° (91) gives (21% yield (90)) exclusively (91) *p*-chlorobenzyl bromide [Beil. V-307, V_2-(239)], cryst. from MeOH, m.p. 62–63° (88), ndls. from 85% alc., m.p. 50° (90), 51° (79), 48.5° (89); for study of rate of side-chain bromination of C̄ in CS_2 at 57° see (92). — C̄ with 2 moles Br_2 in pres. of $BeBr_2$ (93) or in AcOH + fumg. HNO_3 + fumg. H_2SO_4 (94) gives *p*-chlorobenzal (di)bromide, m.p. 99° (93).]

[C̄ with $AlCl_3$ + HCl gas as directed (25) undergoes partial rearr. to both *o*-chlorotoluene (3:8245) and *m*-chlorotoluene (3:8275); for anal. of mixts. of the three isomers see (25).]

[C̄ with AcCl (95) or better Ac_2O (96) (97) + $AlCl_3$ in CS_2 (98) gives (yields: 85% in 4 hrs. (97), 65% (98), 34% in 2 hrs. (96)) 2-chloro-5-methylacetophenone [Beil. VII-307], b.p. 245.8–246.0° at 760.1 mm. (96), n_D^{25} = 1.5419 (96). — C̄ with β-chloropropionyl chloride (3:5690) + $AlCl_3$ in CS_2 gives (87% yield (99)) (100) 4-chloro-3-(β-chloropropionyl)toluene, oil, which on ring closure with conc. H_2SO_4 gives (72% yield (99)) (100) 7-chloro-4-methylindanone-1, cryst. from MeOH, m.p. 128° (99) (100). — C̄ with trichloroacetonitrile + $AlCl_3$ (4 moles) at 80–90° satd. with HCl gas for 2 days gives only 5% yield (101) of a mixt. of 2-chloro-5-methyl- and 5-chloro-2-methyl-ω,ω,ω-trichloroacetophenones.]

[C̄ with oxalyl (di)chloride (3:5060) + $AlCl_3$ in CS_2 for 20 hrs. at room temp. gives (40% yield (102)) 2-chloro-5-methylbenzoic acid (6-chloro-3-methylbenzoic acid) (3:4615), cryst. from aq., m.p. 163–166° (102), accompanied by some dichlorodimethyl-benzophenone, m.p. 70°, whose structure was not detd. — C̄ with fumaryl (di)chloride (3:5875) + $AlCl_3$

in CS_2 at 50–60° for 2 hrs. gives (25% yield (103)) *bis*-1,2-(2-chloro-5-methylbenzoyl)-ethylene, pale yel. cryst. from alc., m.p. 158° (103).]

[$\bar{C}$ with benzoyl chloride + $AlCl_3$ in CS_2 gives (50% yield (98)) (104) (105) 2-chloro-5-methylbenzophenone (6-chloro-3-methylbenzophenone) [Beil. VII_1-(235)], cryst. from AcOH, m.p. 35–36° (98) (104) (105), together with 5-chloro-2-methyl-(3-chloro-6-methyl)-benzophenone [Beil. VII_1-(235)], oil, b.p. 210° at 30 mm. (106). — $\bar{C}$ with *o*-chlorobenzoyl chloride (3:6640) + $AlCl_3$ in CS_2 gives (106) 5,2′-dichloro-2-methylbenzophenone [Beil. VII_1-(235)], oil, b.p. 225° at 12 mm. (106).]

[$\bar{C}$ with phthalic anhydride (1:0725) + $AlCl_3$ gives (62.5% yield on the phthalic anhydride (107)) *o*-(2-chloro-5-methylbenzoyl)benzoic acid, ndls. from C_6H_6, m.p. *164–165°* *(107)*, 165° (108), which with conc. H_2SO_4 at 75° for 4 hrs. (108) or with 8 pts. fumg. H_2SO_4 (20% SO_3) (107) ring-closes to give (yields: 93% (107), 85% (108)) 1-chloro-4-methyl-anthraquinone [Beil. VII-809, VII_1-(421)], yel. ndls. from AcOH or alc., m.p. 164° (107) (108). — Note that the structure of the above keto acid, m.p. 164–165°, has been definitely established (109) as shown and that it is *not* the isomeric *o*-(5-chloro-2-methylbenzoyl)-benzoic acid, which appears to be still unreported. — For reactn. of $\bar{C}$ with 3,6-dichloro-phthalic anhydride (3:4860) (110) or with pyromellitic anhydride (111) in pres. of $AlCl_3$ see indic. refs.]

[$\bar{C}$ does *not* (112) react with *bis*-(chloromethyl) ether (3:5245), but $\bar{C}$ with formalin + conc. HCl yields (62) 4-chloro-3-(chloromethyl)toluene since on reductn. with Zn + NaOH the prod. gives 4-chloro-1,3-dimethylbenzene (3:8665). — $\bar{C}$ with aq. vapor + CO over suitable cat. at 300–400° yields (113) *p*-toluic acid (1:0795). — $\bar{C}$ with NH_3 + CO over suitable cat. as directed (114) yields *p*-toluidine (see also below). — $\bar{C}$ with S_2Cl_2 + $AlCl_3$ in CS_2 gives (115) 4,5-dichloro-1,8-dimethylthianthrene, m.p. 195–197° (115).]

[$\bar{C}$ with Li in ether gives (63% yield (116)) *p*-tolyllithium; $\bar{C}$ with Li at 150° followed by treatment with aq. gives (117) toluene + 4,4′-dimethylbiphenyl. — $\bar{C}$ with Na in C_6H_6 treated with CO_2 at ord. temp. (118) (119) or at 50° and 500 lbs. press. (120) cf. (121) gives (yields: 95% (120), 76% (121)) *p*-toluic acid (1:0795), m.p. 178°. — $\bar{C}$ with Na treated with benzophenone as directed (122) yields diphenyl-*p*-tolyl-carbinol [Beil. VI-722, VI_1-(355)], m.p. 72–73°.]

[$\bar{C}$ on hydrolysis with aq. vapor over silica gel contg. 3% finely divided Ni at 380° (123), or with aq. vapor over cat. at 480° (124), or with aq. Na_2CO_3 in pres. of Cu at 300° under press. (125), or with 15–20% aq. NaOH at 300° (126) gives (80% yield (123)) *p*-cresol (1:1410). Note, however, claim (127) that $\bar{C}$ when hydrolyzed with 15% aq. NaOH in pres. of Cu for 2 hrs. at 315–320° yields prod. contg. not only *p*-cresol (1:1410) but also *m*-cresol (1:1730) (for extensive study of hydrolysis of $\bar{C}$ as means of prepn. of *m*-cresol see (147)). — $\bar{C}$ with H_2S at 700° over suitable cat. yields (128) thio-*p*-cresol (*p*-tolyl-mercaptan).]

[$\bar{C}$ with aq. NH_4OH + CuO at 150–250° under press. (129) or $\bar{C}$ + aq. NH_4OH + Cu salts + various anti acids at 225–230° under press. (130) (131) yields *p*-toluidine and/or di-*p*-tolylamine. — $\bar{C}$ with KNH_2 in liq. NH_3 (132) or Na in liq. NH_3 (66) yields *p* toluidine. — Note that $\bar{C}$ does not react with aq. sodium sulfanilate + Na_2CO_3 (dif. from benzyl chloride (3:8535) and use in sepn. of $\bar{C}$ from latter (8)).]

[$\bar{C}$ on mononitration yields a mixt. contg. both *4-chloro-2-nitrotoluene* [Beil. V-327, V_1-(162), V_2-(251)], m.p. 38.2° (133), 37–38° (10), 37° (29) (22), b.p. 239.5–240° at 718 mm. (134), 115.5° at 11 mm. (22) (easily volatile with steam, but not reacting with piperidine even after 8 hrs. at 100° (10)), and *4-chloro-3-nitrotoluene* [Beil. V-329, V_2-(252)], m.p. 7° (135), 5.8° (133), b.p. 260° at 745 mm. (135), 118° at 11 mm. (22) (reacts readily with piperidine at 100° (10)); e.g., $\bar{C}$ added in 2 equal portions to 3 wt. pts. HNO_3 (D = 1.5) at 0° gives 88% yield of mixt. contg. 58.8% 4-chloro-2-nitrotoluene + 41.2% 4-chloro-3-

[C̄ on pyrolysis over red-hot Pt yields (63) mainly 4,4′-dichlorodibenzyl (1,2-*bis*-(*p*-chlorophenyl)ethane [Beil. V-600, V_1-(281), V_2-(507)], colorless lfts. from alc., m.p. 112°, accompanied by a very small amt. 4,4′-dichlorostilbene (1,2-*bis*-(*p*-chlorophenyl)ethylene) [Beil. V_1-(304), V_2-(539)], ndls. from alc., m.p. 170°.]

[C̄ with H_2 in pres. of $Pd/CaCO_3$ (64) or reduced Ni (65) in alc./alk. soln. loses all its halogen as HCl; C̄ with Na in liq. NH_3 as directed (66) yields toluene and other prods.; C̄ with HI + P in s.t. at 302° for 5 hrs. gives (80% yield (67)) toluene.]

C̄ on oxidn. with 3 pts. $KMnO_4$ in dil. aq. soln. under reflux for 4–5 hrs. (68) (51), or with CrO_3 (42), or with dil. HNO_3, e.g., with 6 pts. of dil. HNO_3 (1 vol. conc. HNO_3 + 2 vols. aq.) at 145° for 1½ hrs. (69) or at 115–120° for 5–6 hrs. (70), yields *p*-chlorobenzoic acid (3:4940), m.p. 243° (for use in quant. estn. of C̄ in pres. of toluene, benzyl chloride, and *o*-chlorotoluene see (70)). — Note that with HNO_3 C̄ is more rapidly oxidized than *o*-chlorotoluene, *m*-chlorotoluene, or the various dichlorotoluenes but more slowly than *p*-bromotoluene (69). — C̄ on oxidn. with air at 260° in pres. of Na_2CO_3 and under press. (71), or on vapor-phase oxidn. over suitable cat. (72), or on electrolytic oxidn. in dil. Na_2CO_3 soln. at 60° (73) cf. (74), or even on very long stdg. (2 years) with I_2 + aq. in sunlight (75) gives *p*-chlorobenzoic acid. — C̄ with N_2O_4 yields (76) *p*-chlorobenzoic acid accompanied by nitration prods.

[C̄ with chromyl chloride (CrO_2Cl_2) yields an addn. prod. which with aq. gives in good yield (77) *p*-chlorobenzaldehyde (3:0765). — C̄ with air in aq. susp. of FeO.OH + cat. at 235–240° and 50–60 atm. press. gives (78) a mixt. of *p*-chlorobenzaldehyde (3:0765) + *p*-chlorobenzoic acid (3:4940).]

[C̄ with Cl_2 or on htg with $PbCl_4.2NH_4Cl$ or with SO_2Cl_2 in pres. of dibenzoyl peroxide in dark yields *p*-chlorobenzyl chloride (3:0220), q.v. for relevant refs. — C̄ with 2 moles Cl_2 in pres. of 5% PCl_5 at 160–170° gives (79) (80) *p*-chlorobenzal (di)chloride (3:6700). — *C̄ with 3 moles Cl_2 at high temp. in u.v. light (81) cf. (82) or with 3 moles Cl_2 (83) in pres.* of $FeCl_3$ (84) or of PCl_5 (85) (86) gives (93% yield (85)) *p*-chlorobenzotrichloride (3:6825) q.v. — C̄ with Cl_2 (1 mole) in pres. of 1% Fe or 40% $PbCl_2$ at 20° gives (65% yield (87)) a mixt. comprising 58.4% 2,4-dichlorotoluene (3:6290) + 41.6% 3,4-dichlorotoluene (3:6355).]

[C̄ with Br_2 at 130° (88) or at 160° (89) (90) or in pres. of dibenzoyl peroxide in dark at 100° (91) gives (21% yield (90)) exclusively (91) *p*-chlorobenzyl bromide [Beil. V-307, V_2-(239)], cryst. from MeOH, m.p. 62–63° (88), ndls. from 85% alc., m.p. 50° (90), 51° (79), 48.5° (89); for study of rate of side-chain bromination of C̄ in CS_2 at 57° see (92). — C̄ with 2 moles Br_2 in pres. of $BeBr_2$ (93) or in AcOH + fumg. HNO_3 + fumg. H_2SO_4 (94) gives *p*-chlorobenzal (di)bromide, m.p. 99° (93).]

[C̄ with $AlCl_3$ + HCl gas as directed (25) undergoes partial rearr. to both *o*-chlorotoluene (3:8245) and *m*-chlorotoluene (3:8275); for anal. of mixts. of the three isomers see (25).]

[C̄ with AcCl (95) or better Ac_2O (96) (97) + $AlCl_3$ in CS_2 (98) gives (yields: 85% in 4 hrs. (97), 65% (98), 34% in 2 hrs. (96)) 2-chloro-5-methylacetophenone [Beil. VII-307], b.p. 245.8–246.0° at 760.1 mm. (96), n_D^{25} = 1.5419 (96). — C̄ with β-chloropropionyl chloride (3:5690) + $AlCl_3$ in CS_2 gives (87% yield (99)) (100) 4-chloro-3-(β-chloropropionyl)toluene, oil, which on ring closure with conc. H_2SO_4 gives (72% yield (99)) (100) 7-chloro-4-methylindanone-1, cryst. from MeOH, m.p. 128° (99) (100). — C̄ with trichloroacetonitrile + $AlCl_3$ (4 moles) at 80–90° satd. with HCl gas for 2 days gives only 5% yield (101) of a mixt. of 2-chloro-5-methyl- and 5-chloro-2-methyl-ω,ω,ω-trichloroacetophenones.]

[C̄ with oxalyl (di)chloride (3:5060) + $AlCl_3$ in CS_2 for 20 hrs. at room temp. gives (40% yield (102)) 2-chloro-5-methylbenzoic acid (6-chloro-3-methylbenzoic acid) (3:4615), cryst. from aq., m.p. 163–166° (102), accompanied by some dichlorodimethyl-benzophenone, m.p. 70°, whose structure was not detd. — C̄ with fumaryl (di)chloride (3:5875) + $AlCl_3$

in CS_2 at 50–60° for 2 hrs. gives (25% yield (103)) *bis*-1,2-(2-chloro-5-methylbenzoyl)-ethylene, pale yel. cryst. from alc., m.p. 158° (103).]

[$\bar{C}$ with benzoyl chloride + $AlCl_3$ in CS_2 gives (50% yield (98)) (104) (105) 2-chloro-5-methylbenzophenone (6-chloro-3-methylbenzophenone) [Beil. VII_1-(235)], cryst. from AcOH, m.p. 35–36° (98) (104) (105), together with 5-chloro-2-methyl-(3-chloro-6-methyl)-benzophenone [Beil. VII_1-(235)], oil, b p. 210° at 30 mm. (106). — $\bar{C}$ with *o*-chlorobenzoyl chloride (3:6640) + $AlCl_3$ in CS_2 gives (106) 5,2′-dichloro-2-methylbenzophenone [Beil. VII_1-(235)], oil, b.p. 225° at 12 mm. (106).]

[$\bar{C}$ with phthalic anhydride (1:0725) + $AlCl_3$ gives (62.5% yield on the phthalic anhydride (107)) *o*-(2-chloro-5-methylbenzoyl)benzoic acid, ndls. from C_6H_6, m p. 164–165° (107), 165° (108), which with conc. H_2SO_4 at 75° for 4 hrs. (108) or with 8 pts. fumg. H_2SO_4 (20% SO_3) (107) ring-closes to give (yields: 93% (107), 85% (108)) 1-chloro-4-methyl-anthraquinone [Beil. VII-809, VII_1-(421)], yel. ndls. from AcOH or alc., m.p. 164° (107) (108). — Note that the structure of the above keto acid, m.p. 164–165°, has been definitely established (109) as shown and that it is *not* the isomeric *o*-(5-chloro-2-methylbenzoyl)-benzoic acid, which appears to be still unreported — For reactn. of $\bar{C}$ with 3,6-dichlorophthalic anhydride (3:4860) (110) or with pyromellitic anhydride (111) in pres. of $AlCl_3$ see indic. refs.]

[$\bar{C}$ does *not* (112) react with *bis*-(chloromethyl) ether (3:5245), but $\bar{C}$ with formalin + conc. HCl yields (62) 4-chloro-3-(chloromethyl)toluene since on reductn. with Zn + NaOH the prod gives 4-chloro-1,3-dimethylbenzene (3:8665). — $\bar{C}$ with aq. vapor + CO over suitable cat at 300–400° yields (113) *p*-toluic acid (1:0795). — $\bar{C}$ with NH_3 + CO over suitable cat. as directed (114) yields *p*-toluidine (see also below). — $\bar{C}$ with S_2Cl_2 + $AlCl_3$ in CS_2 gives (115) 4,5-dichloro-1,8-dimethylthianthrene, m.p. 195–197° (115).]

[$\bar{C}$ with Li in ether gives (63% yield (116)) *p*-tolyllithium; $\bar{C}$ with Li at 150° followed by treatment with aq. gives (117) toluene + 4,4′-dimethylbiphenyl. — $\bar{C}$ with Na in C_6H_6 treated with CO_2 at ord. temp. (118) (119) or at 50° and 500 lbs. press. (120) cf. (121) gives (yields: 95% (120), 76% (121)) *p*-toluic acid (1·0795), m.p. 178°. — $\bar{C}$ with Na treated with benzophenone as directed (122) yields diphenyl-*p*-tolyl-carbinol [Beil. VI-722, VI_1-(355)], m p. 72–73°.]

[$\bar{C}$ on hydrolysis with aq. vapor over silica gel contg 3% finely divided Ni at 380° (123), or with aq. vapor over cat. at 480° (124), or with aq. Na_2CO_3 in pres. of Cu at 300° under press. (125), or with 15–20% aq. NaOH at 300° (126) gives (80% yield (123)) *p*-cresol (1·1410). Note, however, claim (127) that $\bar{C}$ when hydrolyzed with 15% aq. NaOH in pres. of Cu for 2 hrs. at 315–320° yields prod. contg. not only *p*-cresol (1:1410) but also *m*-cresol (1·1730) (for extensive study of hydrolysis of $\bar{C}$ as means of prepn. of *m*-cresol see (147)). — $\bar{C}$ with H_2S at 700° over suitable cat. yields (128) thio-*p*-cresol (*p*-tolyl-mercaptan).]

[$\bar{C}$ with aq. NH_4OH + CuO at 150–250° under press. (129) or $\bar{C}$ + aq. NH_4OH + Cu salts + various anti acids at 225–230° under press. (130) (131) yields *p*-toluidine and/or di-*p*-tolylamine. — $\bar{C}$ with KNH_2 in liq. NH_3 (132) or Na in liq. NH_3 (66) yields *p* toluidine. — Note that $\bar{C}$ does not react with aq. sodium sulfanilate + Na_2CO_3 (dif. from benzyl chloride (3:8535) and use in sepn. of $\bar{C}$ from latter (8)).]

[$\bar{C}$ on mononitration yields a mixt. contg both *4-chloro-2-nitrotoluene* [Beil. V-327, V_1-(162), V_2-(251)], m.p 38.2° (133), 37–38° (10), 37° (29) (22), b.p. 239 5–240° at 718 mm. (134), 115.5° at 11 mm. (22) (easily volatile with steam, but not reacting with piperidine even after 8 hrs at 100° (10)), and *4-chloro-3-nitrotoluene* [Beil. V-329, V_2-(252)], m p. 7° (135), 5.8° (133), b p. 260° at 745 mm. (135), 118° at 11 mm. (22) (reacts readily with piperidine at 100° (10)); e g., $\bar{C}$ added in 2 equal portions to 3 wt. pts HNO_3 (D = 1.5) at 0° gives 88% yield of mixt. contg. 58 8% 4-chloro-2-nitrotoluene + 41.2% 4-chloro-3-

3:8290 ETHYL β-CHLOROPROPIONATE

$C_5H_9O_2Cl$ Beil. II - 250

$ClCH_2.CH_2.CO.O.C_2H_5$ II_1-(111)

II_2-(227)

B.P. 162–163° at 765 mm. (1)	D_4^{20} = 1.1086 (5)	n_D^{20} = 1.42537 (5)
162.5° at 761 mm. (2)	1.1025 (18)	1.4269 (18)
162–163° at 760 mm. (3)		
162° (4)	D_4^{15} = 1.1141 (2)	n_D^{15} = 1.4284 (2)
161.4–161.8° at 758 mm. (5)		
161° (6)		
80° at 29 mm. (2)		
61.5° at 15 mm. (7)		

[For prepn. of C̄ from β-chloropropionic acid (3:0460) by esterification with EtOH + HCl (59% yield (6)) (4) or H_2SO_4 (1) see indicated refs.; from β-chloropropionyl chloride (3:5690) + EtOH see (1); from acrylic acid chloride (3:7153) + EtOH see (4) (7); from ethyl acrylate (1:3071) + HCl see (2); from acrylonitrile + HCl *to* β-chloropropionitrile followed by reactn. with EtOH see (8); from ethyl lactate (1:3303) + $SOCl_2$ + pyridine (95% yield (9)) see (9).]

C̄ with 20% alc. NaOH at room temp. (10) or htd. at 95–100° with 10 pts. conc H_2SO_4 (11) gives (90% yield (10)) *ethyl acrylate (1:3071), b.p. 101°.*

C̄ refluxed with NaI in acetone gives (yield: 81% (12), 75–80% (13)) ethyl β-iodopropionate, b.p. 183–185° at 760 mm. (13). [For study of rate of reactn. with KI in acetone see (6).] [Note also that β-iodopropionic acid with alc. HCl (as in its esterification) gives some ethyl β-chloropropionate *(14).*]

C̄ on catalytic hydrogenation as specified (7) takes up only a little H_2 [dif. from ethyl α-chloropropionate which gives quant. ethyl propionate].

[For reactns. of C̄ with CH_3MgI (15), C_2H_5MgBr (16), and other RMgX cpds. (17) see indicated refs.]

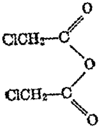
3:0730 CHLOROACETIC ACID ANHYDRIDE $C_4H_4O_3Cl_2$

Beil. II - 199
II_1-(89)
II_2-(193)



M.P. 48–49° (16)	B.P. 163°	at 116 mm. (4)	$D_4^{50} = 1.3604$ (5)
46–47° (1)	161°	at 104 mm. (4)	$D_4^{20} = 1.5497$ (5)
46° (2)	149°	at 62 mm. (4)	
45.2° (3)	144°	at 51 mm. (4)	
	135°	at 36 mm. (4)	
	126–128°	at 30 mm. (5)	
	126°	at 24 mm. (4)	
	115–120°	at 20 mm. (6)	
	109–110°	at 10 mm. (2)	
	108–110°	at 10 mm. (16)	

Note that the above name of C̄ is so rendered to emphasize that it is the anhydride of chloroacetic acid (not a monochlorinated acetic anhydride).

Pr. from C_6H_6; eas sol. cold ether, $CHCl_3$; spar. sol. cold C_6H_6; insol. cold lgr.

[For prepn of C̄ from chloroacetic acid (3:1370) with P_2O_5 in vac. (2), or with Ac_2O (5) (6) (in latter case note also formn. of mixed anhydride acetic-chloroacetic anhydride, b.p. 80–83° at 30 mm. (5), 80–85° at 20 mm. (3), $D_4^{20} = 1.2003$ (5)), or with chloroacetyl chloride (3 5235) + an inorg acid chloride (7) or $AlCl_3$ (8), see indic. refs.; for prepn. of C̄ from sodium chloroacetate with oxalyl (di)chloride (3:5060) in C_6H_6 (54% yield) see (9); for prepn. of C̄ from chloroacetyl chloride (3:5235) with Na_2CO_3 (4) or KNO_3 (1) see indic. refs]

C̄ with aq K_2CO_3 yields (2) polyglycolide (1:4976), m.p. 220°.

[For reactn. of C̄ with $AlCl_3$ + toluene giving 46–59% ω-chloro-*p*-methylacetophenone (3:1130) see (10); for reactn. of C̄ with $AlCl_3$ + biphenyl giving 41% yield ω-chloro-*p*-phenylacetophenone, pale yel ndls. from dil. alc , m.p. 122–123° see (11); for abnormal reactn. of C̄ with benzyl MgCl yielding ω-chloro-*o*-methylacetophenone (3:9660) see (12).]

[For behavior of C̄ with various carbohydrates (13) and with cellulose (14) see indic. refs.]

C̄ htd. 4 hrs. at 160–180° with phenyl isothiocyanate yields (15) after distn. at 14–20 mm. 2,4-dioxo-3-phenylthiazolidine [Beil. XXVII-238, $XXVII_1$-(305)], m p. 147–148° (15).]

C̄ with aq hydrolyzes almost instantly yielding chloroacetic acid (3:1370). — For the amide, anilide, *p*-toluidide, and other derivs. corresp. to C̄ see chloroacetic acid (3:1370).

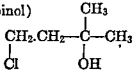
3:8335 4-CHLORO-2-METHYLBUTANOL-2 $C_5H_{11}OCl$ Beil. I - 390

(β-Chloroethyl-dimethyl-carbinol) I_1— I_2-(424)



B.P. 166° (1)
72° at 13 mm. (2)
62–63° at 14 mm. (3)

[For prepn. of C̄ from methyl β-chloropropionate (3:5765) (3) or from ethyl β-chloropropionate (3:8290) (1) (53% yield (2)) with MeMgBr see indic. refs.]

C̄ with fumg. HCl at room temp. yields (1) 2,4-dichloro-2-methylbutane (3:8105).

C̄ mixed with 3 pts. dry powdered KOH and htd. at 130–180° gives (43% yield (2)) by loss of HCl and ring closure 2,4-epoxy-2-methylbutane (α,α-dimethyltrimethylene oxide), b.p. 71° at 750 mm., $D_4^{20} = 0.8279$ (2).

C̄ with specially dried K phthalimide htd. in a s.t. 8 hrs. at 169°, finally 3½ hrs. at 218°, yields (3) (by metathesis and loss of H_2O) *N*-(2-methylbuten-2-yl-4)phthalimide, m.p. 99° (3).

3:8335 (1) Henry, *Bull. soc. chim. Belg.* **20**, 152–156 (1906); *Cent.* **1906**, II 1178; *Compt. rend.* **142**, 133 (1906). (2) Bennett, Philip, *J. Chem. Soc.* **1928**, 1938. (3) Späth, Spitzy, *Ber.* **58**, 2276–2277 (1925).

3:8325 ETHYL β-CHLOROISOCROTONATE $C_6H_9O_2Cl$ Beil. II - 417
II₁-(190)
II₂-(397)

B.P.		B.P. (*contd*)			
165.6–167.2°	(1)	60° at 15 mm.	(7)	D_4^{20} = 1.088	(8)
164°	(13)	56–57° at 13 mm.	(8) (9)	1.087	(7)
161.4°	(2)	54° at 14 mm.	(10)	1.086	(11)
159–161°	(3)	50° at 10 mm.	(11)	n_D^{20} = 1.4538	(7)
157–158° at 740 mm.	(4)			$D_4^{18.7}$ = 1.0924	(3)
155–156°	(5)			$n_D^{18.7}$ = 1.45423	(3)
154–157°	(6)			$D_4^{17.7}$ = 1.0896	(8)
				$n_D^{17.7}$ = 1.45467	(8)
				$D_4^{14.4}$ = 1.0920	(11)

[*See also ethyl β-chlorocrotonate* (3:8538).]

Note the lack of accord regarding the b.p. of C̄ especially at ordinary pressures; this is presumably attributable to more or less contamination with the stereoisomeric ester (3:8538).

[For prepn. of C̄ from β-chloroisocrotonic acid (3:1300) in EtOH with dry HCl gas (yields: 100% (4), 65% (12)) (2) (5) or a little conc. H_2SO_4 (yield 65% (6)) (8) (11) see indic. refs.]

[For prepn. of C̄ from ethyl acetoacetate (1·1710) with PCl_5 in C_6H_6 followed by refluxing with a little I_2 see (13) (1); note, however, that this method has subsequently (6) been regarded as unsatisfactory for the prepn. of pure C̄ although it suffices to give (40–50% yields (14)) a mixt. of C̄ with its stereoisomer (3:8538) which for many purposes is adequate.]

[C̄ (2 moles) with K_2S (1½ moles) in 5 vols. abs. EtOH refluxed for 5 hrs. (note that the stereoisomer (3:8538) requires 16) gives (53% yield (14)) diethyl β,β′-thiodicrotonate, $S(—C(CH_3)=CH.COOC_2H_5)_2$, b.p. 150–153° at 4 mm. (14), accompanied by some ethyl β-mercaptocrotonate (see below).]

[C̄ with alc. NaSH as directed gives (55–60% yield crude prod. (15)) ethyl β-mercaptocrotonate, note that this prod. is apparently a mixt. of the two geom. stereoisomeric thioenols together with the keto form, viz., ethyl thioacetoacetate, CH_3 CS.CH_2.$COOC_2H_5$; for details see (15); note also that ethyl β-chlorocrotonate (3:8538) by the same treatment gives the same result so that a mixt. of the esters can be employed as initial material.]

[C̄ with alkali derivs. of alcohols, phenols, mercaptans, etc., splits out alkali halide yielding corresp. ethyl β-substituted crotonates: e.g., C̄ with NaOEt in ether gives (5) ethyl β-ethoxycrotonate [Beil. III-373, III₁-(135), III₂-(254)], m p. 29.5° (5); C̄ with Na allylate gives (6) ethyl β-allyloxycrotonate; C̄ with Na cinnamylate gives (6) ethyl β-cinnamyloxycrotonate; C̄ with Na phenolate gives (16) ethyl β-phenoxycrotonate, b.p. 152° at 18 mm. (16); note that in the three preceding cases either C̄ or its stereoisomer (3:8538) yields the same result.]

[C̄ with Na salt of ethyl mercaptan gives (12) ethyl β-ethylmercaptoisocrotonate, b.p. 127–129° at 16 mm. (12); C̄ with Na salt of benzyl mercaptan gives (75% yield (12)) a mixt. of ethyl β-benzylmercaptocrotonate, m.p. 64.5° (12), and ethyl β-benzylmercaptoisocrotonate (consts. not given).]

[C̄ with diethyl sodiomalonate gives (9) cf. (17) *cis* diethyl α-carbethoxy-β-methylglutaconate, $(C_2H_5OOC)_2CH.C(CH_3)=CH.COOC_2H_5$ [Beil. II-853], b p. 164–165° at 12 mm.,

3:8346 2-CHLORO-OCTENE-1 $CH_3—(CH_2)_5—C(Cl)═CH_2$ $C_8H_{15}Cl$ Beil. I-221, I_1—, I_2—

Cryst. with agreeable camphoraceous odor from MeOH or EtOH. — Eas. sol. MeOH, C_6H_6, toluene, or pet. ether; spar. sol. in abs. alc. below 0°.

$\bar{C}$ slowly sublimes but on attempted distn. at ord. press. decomposes at about 240°.

[For prepn. of $\bar{C}$ from chloral (3:5210), chloral hydrate (3:1270), or metachloral with $ClSO_3H$ or FSO_3H at not above 50–60° see (1); note that from chloral (3:5210) with $ClSO_3H$ at −50° for 10–12 hrs. yield of $\bar{C}$ may be as high as 50%; from metachloral with $ClSO_3H$ at 50° for a few hrs. yield is 60% (1); note also that various other products including chloralide (3:3510) are also formed. — For formn. of $\bar{C}$ from trichloroethylene (3:5170) with excess Cl_2O in CCl_4 at −20° (2), or perhaps from *α,α′*-dichlorodiethyl ether (3:7595) with Cl_2 in sunlight (3), see indic. refs.]

$\bar{C}$ on htg. in pres. of air gives (2) phosgene (3:5000).

$\bar{C}$ on reduction with conc. HI ($D = 1.78$) in boilg. AcOH quantitatively yields (2) ethane.

$\bar{C}$ is fairly stable toward boilg. aq. or aq. alkalies (1).

$\bar{C}$ is claimed (1) to react with 2 moles of RMgX cpds. of either aliphatic or aromatic types, but no details are reported.

3:0738 (1) Fuchs, Katscher, *Ber.* **62**, 2381–2386 (1929). (2) Goldschmidt, Schussler, *Ber.* **58**, 569–570 (1925). (3) Roth, *Ber.* **8**, 1017–1018 (1875).

See also Note 2.
See also Note 3.

Note 1. Despite an earlier report (1), C̄ is later (34) stated to decompose so readily on heating that precise detn. of boiling point at 760 mm. is impracticable.

Note 2. The presence of benzyl alc. (1:6480) lowers density; presence of HCl or of oxidation products raises density (24).

Note 3. Values of n_D^{20} for mixtures of C̄ with benzal (di)chloride (3:6327) (for which n_D^{20} = 1.5502) are linear with composition (31).

[*See also benzal (di)chloride* (3:6327) *and benzotrichloride* (3:6540).]

Colorless liq. with penetrating odor; vapor of C̄ is irritating to eyes. — Insol. aq., volatile with steam. — Insol. cold conc. H_2SO_4, but soon reacts evolving HCl. C̄ dissolves below −20° in equal vol. pet. ether (35).

Binary systems containing C̄. *C̄ + toluene:* for b.p. and vapor press. relations see (36). — *C̄ + anisole:* for f.p./composition data see (25). — *C̄ + N-methylaniline:* for f.p./composition data see (25).

C̄ with benzaldehyde (1:0195) forms a const.-boilg mixt., b.p. 177.9° at 760 mm., contg. 50 wt. % C̄ (37-a). — *C̄ with n-butyric acid* (1:1035) forms a const.-boilg. mixt , b.p. 160 8° at 760 mm , contg. 35 wt. % C̄ (38) — *C̄ with isobutyric acid* (1:1030) forms a const.-boilg. mixt , b.p. 153 5° at 760 mm , contg. 20 wt. % C̄ (38). — *C̄ with n-caproic acid* (1:1130) forms a const.-boilg mixt , b.p. 179.0° at 760 mm , contg. 97 wt. % C̄ (38).

C̄ with chloroacetic acid (3:1370) forms a const -boilg mixt., b.p. 172° at 760 mm., contg. 72 wt. % C̄ (38-b) — *C̄ with "α-dichlorohydrin"* (1,3-dichloropropanol-2) (3:5985) forms a const.-boilg. mixt , b.p. 168.9° at 760 mm., contg. 43 wt % (2)

PREPARATION OF C̄

From benzene. The prepn. of C̄ from benzene (1:7400) by direct introduction of the —CH_2Cl group (chloromethylation) has been much studied especially in recent years. Chloromethylation may be effected with paraformaldehyde (1:0080), formalin (1:0145), chloromethyl methyl ether (3.7085), or *bis*-(chloromethyl) ether (3:5245), each in the pres. of $ZnCl_2$ and frequently also of HCl gas. For a general review of the process of chloromethylation see (39) and subsequent articles (32) (40) (41). Various by-products of the reaction are formed, notably ω,ω'-dichloro-*p*-xylene (3:2825) and diphenylmethane (1:7120). For study of further chloromethylation of C̄ to various poly-(chloromethyl)-benzenes see (41).

[For prepn. of C̄ from C_6H_6 (1:7400) by chloromethylation with paraformaldehyde (1:0080) + $ZnCl_2$ + HCl (yields: 80% (42), 73 5% (40), 70% (32), 36% (42)) (39), with formalin (1:0145) + $ZnCl_2$ + HCl (yields: 70.5% (40), 57% (44)) (45) (39) (48), or with chloromethyl methyl ether (3:7085) (40) (43) (46) (47) or *bis*-(chloromethyl) ether (3:5245) (40) (43) see indic. refs.]

From toluene. [For prepn. of C̄ from toluene (1:7405) by chlorination with SO_2Cl_2 in pres. of dibenzoyl peroxide (75–80% yield (15)), with SO_2Cl_2 (for study of effect of catalysts see (83) (84)) below 130° (49) (50), with SO_2Cl_2 in pres. of acetyl chloride (51), with Cl_2 (52) (53) (for study of catalysts see (85)) in vapor phase (54) (55) (61) in light (56) (57) (58) (59) (60) (62), with Cl_2 in pres. of Pb + PCl_3 (63), with NOCl at 150° (64) or 350° (65), with NCl_3 (66), or with *ter*-butyl hypochlorite (3.7165) (62% yield (67)) see indic. refs.]

From benzyl alcohol. [For prepn. of C̄ from benzyl alcohol (1:6480) with HCl gas (68), with conc. aq HCl at 60° (70–100% yield (69)) (70) in C_6H_6 (study of kinetics at 60° (71)), with conc. HCl + $ZnCl_2$ in cold (100% yield (72)), with PCl_3 + $ZnCl_2$ (60% yield (72)), with $SOCl_2$ (100% yield (73)) in C_6H_6 (85% yield (72)) or in *N,N*-dimethylaniline (26% yield (72)), or with $AlCl_3$ in pet. eth. above 40° (74) see indic. refs.]

From other miscellaneous sources. [For formn. of C̄ from benzyl chloroformate (3:9565) on htg. (75) (76), from benzyl benzoate (1:4422) with 5 moles SO_2Cl_2 (77), from dibenzyl ether (1:7640) or other benzyl ethers with PCl_5 (78), from dibenzyl disulfide with excess SO_2Cl_2 in C_6H_6 at 37–39° (79), from benzylamine with NOCl in ether at −15° (80) or with *aqua regia* (81), or from tetrabenzylhydrazine with conc. HCl on htg. (82) see indic. refs.]

CHEMICAL BEHAVIOR OF C̄

Determination of C̄. Many methods for detn. of C̄ have been employed and no complete listing can be given here; the following examples, however, may be helpful. [For detn. of C̄ by boilg. with alc. $AgNO_3$ and weighing pptd. AgCl see (85) cf. (83); for detn. of C̄ in

C_6H_6 by addn. of excess standard $AgNO_3$ in isopropyl alc., htg. several hrs., and excess $AgNO_3$ titrated with standard aq. NaCl see (71); for methods of detn. of C̄ in pres. of benzal (di)chloride (3:6327) or benzotrichloride (3:6540) see (86) (87).]

Pyrolysis of C̄. [C̄ on boiling (34) (88) gradually dec. with evoln. of HCl. — C̄ over glowing Pt wire gives (89) (90) much stilbene (1:7250) accompanied (91) by small amounts of toluene (1:7405) and dibenzyl (1:7149).]

Resinification of C̄. C̄ under the influence of various catalysts condenses with itself evolving HCl and yielding a material of composition $(C_7H_6)_n$; this material is often (though incorrectly) designated as polymeric C̄. Because of the indefinite character of the product and the voluminous and diffuse character of the literature, no exhaustive review will here be attempted. However, for extensive reviews of this reaction see (92) (93); for studies of catalysts for this type of reaction see also (94) (95) (96) (97).

Reduction of C̄. [C̄ with H_2 in pres. of $Pd/BaCO_3$ (98) or Ni (99) in alc. KOH loses all its halogen as HCl (use in quant. detn.), but the corresp. org. reduction prod. has not been characterized. — C̄ with H_2 in pres. of colloidal Pd in alc. gives (76% yield (100)) toluene (1:7405). — C̄ with EtOH + Zn dust on boilg. gives (101) cf. (102) toluene (1:7405) + benzyl ethyl ether (1:7530). — C̄ in EtOH/KOH with hydrazine hydrate in pres. of Pd boiled for 1 hr. gives (29% yield (103)) dibenzyl (1:7149); note that in conc. soln. only traces of dibenzyl are formed (103) cf. (104) and the principal prod. is *N,N*-dibenzylhydrazine [Beil. XV-533, XV_1-(164)] accompanied by some benzyl ethyl ether (1:7530).]

Oxidation of C̄. C̄ upon oxidn. yields either benzoic acid or benzaldehyde according to circumstances.

[C̄ with air at 160° over Ni cat. (105), with O_2 in u.v. light (106), or with CrO_3/H_2SO_4 at 95–98° for 1½ hrs. (note that β-chloroethylbenzene (3:8712) is stable under these conditions (107)) cf. (53), gives benzoic acid (1:0715). — C̄ with conc. aq. alk. at 250–280° and at 300–500 lb./sq. in. press. gives (80–90% yield (108)) benzoic acid (1:0715).]

[C̄ with equimolal amt. SeO_2 refluxed without solv. for 3 hrs. (109), with CrO_2Cl_2 followed by aq. (110), with hot very dil. HNO_3 (111) (112), with hot 14% aq. $Pb(NO_3)_2$ (111), with boilg. aq. $Ca(NO_3)_2$ (112), with boilg. aq. $Na_2Cr_2O_7$ + Na_2CO_3 (113), with boilg. aq. or alc. hexamethylenetetramine (114) (115), with air at 160° over Ni cat. (105), or with steam + air at 360–480° over V_2O_5 on pumice (116) (117) gives benzaldehyde (1:0195); naturally any over-oxidn. gives also some benzoic acid (1:0715).]

[Note that auto-ignition temp. of C̄ on Pt in air at ord. press. is 627° (118).]

Substitution of C̄. *Chlorination* [C̄ with NOCl at 150° gives (64) benzal (di)chloride (3:6327). — C̄ with aq. $PbCl_4.2NH_4Cl$ on boilg gives (119) benzal (di)chloride (3:6327) + benzotrichloride (3:6540). — C̄ with Cl_2 in pres. of I_2 at 30–40° gives (120) cf. (121) both *o*-chlorobenzyl chloride (3:6400) and *p*-chlorobenzyl chloride (3:0220). — Note that C̄ with Cl_2 in sunlight (122) undergoes both substitution and addition and that only isolatable prod. was benzal (di)chloride hexachloride, m.p. 153°.]

Bromination. [C̄ with Br_2 at 100° gives (123) cf. (124) a mixt. of benzyl bromide, benzal chlorobromide, and benzal (di) bromide. — C̄ with Br_2 + $BeBr_2$ in ether gives (125) *p*-bromobenzyl bromide. — C̄ with Br_2 in pres. of I_2 gives (126) (127) a mixt. of *p*-bromobenzyl bromide and *p*-bromobenzyl chloride.]

Sulfonation. [Presumably because of facile hydrolysis or resinification of C̄ with conc. H_2SO_4, its direct sulfonation has not been reported. However, *p*-sulfobenzyl chloride (ω-chlorotoluene-*p*-sulfonic acid) [Beil. XI_1-(30)] has been prepd. (e.g., (128) (129)) from sodium salt of *p*-toluenesulfonic acid by chlorination.]

Nitration. C̄ on mononitration gives a mixt. of *o*-nitrobenzyl chloride [Beil V-327, V_1-(162), V_2-(252)], m.p. 49–50° (130), 49.5° (17), 48–48.5° (131), 48–49° (132), 47.9° (133) (143), *m*-nitrobenzyl chloride [Beil. V-329, V_1-(163), V_2-(252)], m.p. 45–46° (130),

45.5° (17) (131) (134), 44.9° (143), 44.8° (133), and p-nitrobenzyl chloride [Beil. V-329, V_1-(163), V_2-(253)], cryst. from alc., m.p. 72.5° (17) (131) (134), 72.4° (133), 71–72° (130), 71.95° (143), 71° (53). — [For earlier studies of this mononitration of $\bar{C}$ see (53) (135) (136) (137) (138) (139) and especially (140). — Subsequent studies of this mononitration have been primarily concerned with the proportion of isomers; e.g., $\bar{C}$ on mononitration with conc. HNO_3 in acetic anhydride gives (133) 40.9% o-, 4.2% m-, and 54.9% p-nitrobenzyl chlorides (cf. (141) (142) (144)). — For thermal anal. of various mixtures of these three nitrobenzyl chlorides see (133) (143). — For study of rate of nitration of $\bar{C}$ in nitrobenzene soln. at 16–18° see (145). Note that p-nitrobenzyl chloride is a useful reagent for characterization of organic acids by conversion to the corresp. p-nitrobenzyl esters (146) (147); for transformation of p-nitrobenzyl chloride to p-nitrobenzyl bromide in alc. NaBr see (147) cf. (148).]

[Direct polynitration of $\bar{C}$ has not been reported; however, p-nitrobenzyl chloride on further nitration with HNO_3/H_2SO_4 as directed (149) (150) gives 2,4-dinitrobenzyl chloride [Beil. V-344, V_2-(263)], tbls. from ether, m.p. 34° (150), 33–34° (149). — No other dinitrobenzyl chlorides and no trinitrobenzyl chlorides have been reported.]

Hydrolysis of $\bar{C}$. $\bar{C}$ on hydrolysis by various means gives benzyl alcohol (1:6480) and HCl.

[$\bar{C}$ with aq. on protracted boilg. (151) (86) in sunlight (154), with steam + cat. at 550–850° (155) cf. (156), with boilg. aq. K_2CO_3 (157) or alk.-earth carbonates at elev. temps. (158) (159), with hot aq. suspension of PbO (111), with boilg. aq. Na_2CO_3, NaOH, or their mixt. (160) (161), or with anhydrous formic acid (162) gives benzyl alcohol (1:6480).— For studies on kinetics of hydrolysis of $\bar{C}$ in aq. (163) (169), in 95% EtOH at 30° and 40° (164) (165), in 50% acetone at 60° (166) cf. (167) (168) (170) (17), in dioxane (22), or in formic acid (170) see indic. refs.]

Behavior of $\bar{C}$ with Other Inorganic Reactants

With alkali sulfhydrates. [$\bar{C}$ with alc. KSH (171) (172) or aq. NaSH (173) (174) (175) gives (75% yield (172)) benzyl mercaptan [Beil. VI-453, VI_1-(224), VI_2-(427)], b.p. 194–195° (171), 99° at 32 mm (176), 75.8–76.2° at 10 mm. (11), D_4^{25} = 0.8097 (176), n_D^{25} = 1.5729 (176) (corresp. benzoate, m.p. 30° (177), 3,5-dinitrobenzoate, m.p. 119–120° (177), reaction prod. with 3-nitrophthalic anhydride, m.p. 136–137° (177), 2,4-dinitrophenyl thioether, m.p. 182.5° cor. (185)). Note that benzyl mercaptan with isotopic sulfur has been prepared (178) from $\bar{C}$ via conversion to RMgCl and reaction with S^{34}.]

With alkali sulfides. [$\bar{C}$ with alc. K_2S (171) or alc. Na_2S (179) gives (83% yield (179)) dibenzyl sulfide [Beil. VI-455, VI_1-(225), VI_2-(429)], tbls. from ether, $CHCl_3$, or alc., m.p. 49–50° (180), 49° (171) (179) (181) (corresp. sulfoxide [Beil. VI-456, VI_1-(226), VI_2-(429)], m.p. 135° (182), 133–134.6° (183), 132–133° (179); corresp. sulfone [Beil. VI-456, VI_1-(226), VI_2-(430)], m.p. 151° (184), 149.5–151° (183), 149.5–150° (179)).]

With alkali polysulfides. [$\bar{C}$ with alc. $Na_2S.9H_2O$ + S (186) (189) in C_6H_6 (187) cf. (188) gives dibenzyl disulfide [Beil. VI-465, VI_1-(229), VI_2-(437)], m.p. 74° (189), 72° (190), 71–72° (191), 70° (186) (corresp. disulfoxide [Beil. VI-466, VI_1-(230), VI_2-(438)], m.p. 108° (190) (192) cf. (209) (201) (210)).]

With salts of various sulfur acids. [$\bar{C}$ with conc. aq. K_2SO_3 (194) cf. (196) or Na_2SO_3 (195) in aq. alc. at 37° (197) (for study of rate at 40° see (16)) or at 190–200° under press. (93% yield (198)), or $\bar{C}$ with aq. Na_2SO_3/NaOH on boilg. (80% yield (199)) (192), gives corresp. salt of toluene-α-sulfonic acid (benzylsulfonic acid) [Beil. XI-116, XI_1-(32)]; for dimorphism of Na salt see (200) (corresp. sulfonyl chloride, m.p. 92–93° (201) (202), 92° (203); corresp. amide, m.p. 105° (203) (192), 104–105° (199), 102° (204); corresp. methyl ester, m.p. 61–62° (205)).]

[$\bar{C}$ with $Na_2S_2O_3$ on boilg. in aq. alc. (206) or aq. (207) gives salt of *S*-benzylthiosulfuric acid [Beil. VI-439, VI_1-(230)] (corresp. quaternary salt, viz., benzyl-dimethyl-phenyl-ammonium *S*-benzylthiosulfate, from metathesis of benzyl-dimethyl-phenyl-ammonium chloride with sodium *S*-benzylthiosulfate, has m.p. 104° (208)).]

With salts of other inorganic acids. [$\bar{C}$ with NaI in acetone (211) (212) or abs. MeOH (213), or $\bar{C}$ with KI in acetone (214) or EtOH (215), gives (90% yield (211)) benzyl iodide [Beil. V-314, V_1-(157), V_2-(241)], m.p. 24° (211) (212), 27–30° (213), b.p. 97–98° at 11 mm. (216), 93° at 10 mm. (214). — *For study of rate of reaction of $\bar{C}$ with KI in acetone at 25°* (19) (20), 30° (19), and 50° (19), or with NaI or LiI in acetone at 25° or 30° (19), see indic. refs.]

[$\bar{C}$ with powdered $AgNO_3$ in dry ether 20 hrs. in cold, then at 70–75° for 5 hrs., gives (84% yield (219)) (220) benzyl nitrate [Beil. VI-439], explosive liquid, b.p. 106° at 20 mm. (219), 100–101° at 18 mm. (21), 43° at 0.5 mm. (220). — For study of kinetics of reaction of $\bar{C}$ with solid $AgNO_3$ (221) in pres. of inert diluents such as dry ether, $CHCl_3$, and CCl_4 (222) see indic. refs.; for study of kinetics of reaction of $\bar{C}$ with $Hg(NO_3)_2$ in aq. dioxane see (21).]

[$\bar{C}$ with $AgNO_2$ (223) (224) (231) or better mercurous nitrate (225) gives ω-nitrotoluene (phenylnitromethane) [Beil. V-325, V_1-(161), V_2-(249)], b.p. 225–227° dec. (226) (227) cf. (228), 141–142° sl. dec. at 35 mm. (226), 135° at 25 mm. (229), 118–119° at 16 mm. (230), 110° at 8 mm. (231), 90–92° at 3 mm. (232); $D_4^{24.7} = 1.1540$ (233), $D_0^{20} = 1.1598$ (226); $n_{He}^{24.7} = 1.5285$ (233), $n_D^{20} = 1.5323$ (226); note, however, that phenylnitromethane is best prepd. in a different way, viz., from benzyl cyanide with methyl nitrate and alc./NaOEt (50–55% yield (232)). — Note that the isomeric benzyl nitrite [Beil. VI-439], unstable oil, b.p. 80–81° at 35 mm. (234), has been reported from benzyl alcohol (1:6480) with aq. $NaNO_2 + H_2SO_4$ (234).]

[$\bar{C}$ with NaN_3 in alc. refluxed 6 hrs. gives (90% yield (234)) ω-azidotoluene (benzyl azide) [Beil. V-350, V_1-(174), V_2-(274)], oil, insol. aq. and volatile with either steam or ether, b.p. 108° at 23 mm. (235), 82.5° at 16.5 mm. (234), 74° cor. at 11 mm. (236); $D_-^{24.9} = 1.0655$ (237); $n_D^{24.9} = 1.53414$ (237).]

[For behavior of $\bar{C}$ with metallic cyanides see below under organic acids.]

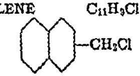
With ammonia. $\bar{C}$ with ammonia under various circumstances (see below) gives one (or more) of the following amines.

Benzylamine [Beil. XII-1013, XII_1-(445)], liq. with faint characteristic odor, misc. with aq. alc. ether: b.p. 184.5° cor. at 760 mm. (238), 184–186° cor. at 745 mm. (239), 184° at 767 mm. (240), 182° at 749 mm. (226), 181.5–182° at 740 mm. (241), 90° at 12 mm (242); $D_4^{25} = 0.9812$ (243), $D_4^{20} = 0.9822$ (244); $n_D^{20} = 1.54015$ (226), $n_D^{19.5} = 1.54406$ (244) (corresp. $\bar{B}$.HCl, m.p. 255.5–258° (245), 255–256° rap. htg. (226), 253° (246); $\bar{B}$ PkOH, m.p. 195–199° (247), 194° (248); $\bar{B}$.3,5-dinitrobenzoic acid, m.p. 210.0° cor. (249); $\bar{B}$ 2,4-dinitrobenzoic acid, m.p. 199.1–200.1° cor. (513); $\bar{B}$.*p*-toluenesulfonic acid, m.p. 180.5–181.5° u.c. (250), 180° (251)). — *Dibenzylamine* [Beil. XII-1035, XII_1-(453)], oil, insol. aq., eas. sol. alc., ether; b.p. >300° dec. (252), 268–271° cor. at 250 mm. (238), 218–220° at 60 mm. (253), 215° ± 1° at 39 mm. (254), 186° at 19 mm. (255), 172° at 14 mm. (256); f.p. −25.6° (254); $D_4^{25} = 1.024$ (255), 1.019 (257); $D_4^{21.6} = 1.0256$ (244); $n_D^{21.6} = 1.57432$ (244) (corresp. $\bar{B}$ HCl, m.p. 256° (252), 255.5° (258); $\bar{B}$.*p*-toluenesulfonic acid, m.p. 155.5–156.5° u.c. (250)). — *Tribenzylamine* [Beil. XII-1038, XII_1-(454)], solid, m.p. 92° (259) (260), 91° (256) (261) (262); b.p. 218–222° at 14 mm. (256), 230° at 13 mm. (259) (corresp. $\bar{B}$.HCl, m.p. 227–228° (263), 221° (261); $\bar{B}$.*p*-toluenesulfonic acid, m.p. 200.0–202.5° u.c. (250)).

[For formn. of mixts. of benzylamine, dibenzylamine, and tribenzylamine (properties given in preceding paragraph) from reaction of $\bar{C}$ with aq. NH_4OH at 80° for 8 days (264) or at 125° and 8 atm. press. (265) in pres. of cat. (266); from reaction of $\bar{C}$ with alc. NH_3 on

3:0747 2-(CHLOROMETHYL)NAPHTHALENE $C_{11}H_9Cl$ Beil. V - 567
V_1—
V_2-(464)

(β-Naphthylmethyl chloride;
β-menaphthyl chloride)



M.P. 48–49° (11) B.P. 170° at 20 mm. (1)
48° (1) 168° at 20 mm. (2) (6)
47.8° (2) 162° at 15 mm. (1)
47–48° (3)
47° (4) (5) (6)

[*See also* 1-(*chloromethyl*)*naphthalene* (3:0250).]

Colorless cryst. from alc. (6) (5); loses HCl on attempted distn. at ord. press.

[For prepn. of C̄ from 2-methylnaphthalene (1:7605) with Cl_2 in sunlight (5) (3) (6) and best at elevated temp., e.g. 220° (7) or even 250–280° (8) (53% yield (11)), see indic. refs.; from β-naphthylcarbinol [Beil. VI-668] (4) (2) with PCl_5 (2) or with $SOCl_2$ in toluene (4) see indic. refs.; from *N*-(benzoyl)-β-naphthylmethylamine (1) or from *N*-(benzoyl)-*bis*-(β-naphthylmethyl)amine (1) by htg with PCl_5 see (1).]

C̄ on oxidn. with aq. $Pb(NO_3)_2$ soln. yields (6) β-naphthaldehyde (1:0036); C̄ on oxidn. with alk. $KMnO_4$ yields (6) β-naphthoic acid (1:0800).

C̄ on reductn. with Zn/Cu couple yields (2) 2-methylnaphthalene (1:7605).

[C̄ with excess Na in dry ether readily gives (8) α,β-*bis*-(2-naphthylmethyl)ethane, m.p. 182° (9) (picrate, m.p. 198° (9)).] — [For study of reactn. of C̄ with 1-(chloromethyl)-naphthalene (3:0250) + $AlCl_3$ in CS_2 see (7).]

[C̄ with Mg in dry ether + trace C_2H_5I gives corresp. β-$C_{10}H_7.CH_2MgCl$, but reactn. is capricious and requires pure C̄ (4), the RMgCl cpd. with AcCl in ether does not follow a normal course but gives instead 1,3-di-(β-naphthyl)-2-methylpropene-1, cryst. from AcOH, m.p. 184–185° (4).]

[*For study of reactn. of* C̄ *with ethyl acetoacetate* + *NaOEt in abs. alc. giving* (83% yield) ethyl α-(β-naphthylmethyl)acetoacetate see (10).]

C̄ with aq. at 100° for 1½ hrs. is 17% hydrolyzed (1).

[C̄ with large excess of conc. C_6H_6 soln. of dimethylamine htd. in s.t. at 100° for 10 hrs. yields (1) *N*,*N*-dimethyl-β-naphthylmethyl-amine.]

3:0750 1,1,2,3,4-PENTACHLOROBUTANE $C_4H_5Cl_5$ Beil. S.N. 10

(Solid diastereoisomer)
(1,2,3,4,4-Pentachlorobutane
(solid diastereoisomer))

$$CH_2(Cl)—CH(Cl)—CH(Cl)—CHCl_2$$

M.P. 49° (1) B.P. 230° (1) D_{-}^{53} = 1.530 (2) n_D^{53} = 1.5065 (2)
48° (2) 105–107° at 13 mm. (1)
102° at 11 mm. (2)

[*See also liquid diastereoisomer* (3:0068).]

gives (yields: 92% (329), 85% (212)) benzylamine (for constants see above under behavior of C̄ with NH_3) as hydrochloride; RMgCl with $BrNH_2$ gives (63% yield (330)) benzylamine. — RMgCl with NCl_3 gives (331) both benzylamine (32% yield) and dibenzylamine (7% yield). — RMgCl with SiF_4 gives (336) $(C_6H_5.CH_2)_3SiF$, m.p. 79°, accompanied by some $(C_6H_5.CH_2)_4Si$, m.p. 127.5°; the latter is also obtd. (20.7% yield (337)) from RMgCl with Na_2SiF_6.]

RMgCl with organic reactants frequently (but not invariably) leads to products derived from *o*-tolyl MgCl and/or *p*-tolyl MgCl: for reviews on and studies of this rearr. of RMgCl see (332) (333) (334) (335). — RMgCl shows little if any tendency to act as a reducing agent in Grignard additions; for review of reducing action of many Grignard reagents (including $C_6H_5.CH_2MgCl$) see (338).

[RMgCl with CO at 120° under press. gives (60% yield (339)) 1,3-diphenylpropene-1 [Beil. V-643, V_1-(310), V_2-(552)]. — RMgCl with CO_2 gives (yields: 75–76% (310), 62.7% (335), 60% (340), 51% (318), 40% (333)) phenylacetic acid (1:0665).]

[RMgCl with trioxymethylene gives (50–55% yield (341)) (342) (343) *o*-tolylcarbinol (1:5922) (*note rearr.*), but RMgCl with acetaldehyde (as paraldehyde) gives (343) (335) the expected benzyl-methyl-carbinol [Beil. VI-503, VI_1-(251), VI_2-(472)]. — RMgCl with benzaldehyde gives according to conditions various prods. including benzyl-phenyl-carbinol (1:5958) (78% yield (344)) (345) (346), stilbene (1:7250) (25–35% yield (316)), and other products.]

[RMgBr with acetone gives (347) (343) benzyl-dimethyl-carbinol (1:5910). — RMgCl gives with diphenylketone (85% yield (349)) (348) benzyl-diphenyl-carbinol [Beil. VI-721, VI_1-(354), VI_2-(696)] easily dehydrated to (54–59% overall yield (316)) α,α,β-triphenylethylene [Beil. V-722, V_1-(355), V_2-(630)].]

[RMgCl with $ClCH_2OCH_3$ (3:7085) according to circumstances gives either or both the "normal" prod. (350) (351) methyl β-phenylethyl ether [Beil. VI-479, VI_1-(238), VI_2-(449)] and the "abnormal" prod. (352) (353) methyl *o*-tolylcarbinyl ether [Beil. VI-484]. — RMgCl with $ClCH_2O.CH_2CH_3$ (3:7195) according to circumstances gives either or both the "normal" prod. (354) ethyl β-phenylethyl ether [Beil. VI_1-(450)] or the "abnormal" products (352) (332) ethyl *o*-tolyl ether [Beil. VI-484] and ethyl *p*-tolyl ether [Beil. VI-498].]

[RMgCl with methyl chloroformate (3:5075) gives some "abnormal" prod. (333). — RMgCl with ethyl chloroformate (3:7295) gives not only the "normal" tribenzylcarbinol [Beil. VI-723, VI_1-(356)] (355) and ethyl phenylacetate (1:3872) but also "abnormal" products (332) (333).]

[RMgCl with acetyl chloride (3:7065) gives (yields: 24% (333), 18% (335)) (332) the "abnormal" product, methyl *o*-tolyl ketone (*o*-methylacetophenone) (1:5224). — RMgCl with benzoyl chloride (3:6240) gives (333) the "abnormal" product, phenyl *o*-tolyl ketone [Beil. VII-439, VII_1-(234)].]

[RMgCl with benzenesulfonyl chloride gives (356) (357) benzyl phenyl sulfone [Beil. VI-455, VI_2-(428)] (2.9% yield (356)) cf. (357) and C̄ (60% yield (356)).]

RMgCl with alkyl *p*-toluenesulfonates gives hydrocarbons. — [E.g., RMgCl with methyl *p*-toluenesulfonate gives (40.9% yield (358)) ethylbenzene (1:7410), with ethyl *p*-toluenesulfonate (358) or diethyl sulfate (359) gives (yields: 100% (359), 38.3% (358)) *n*-propylbenzene (1:7450), with *n*-propyl *p*-toluenesulfonate gives (35.6% yield (358)) *n*-butylbenzene (1:7515), with *n*-butyl *p*-toluenesulfonate gives (yields: 67% (361), 50–59% (360), 24.6% (358)) *n*-amylbenzene (1:7549). — RMgCl with γ-chloro-*n*-propyl *p*-toluenesulfonate gives (42–50% yield (362)) ω-chloro-*n*-butylbenzene (δ-phenyl-*n*-butyl chloride) [Beil. V_1-(201), V_2-(317)].]

stdg. several days (268) (269) (270) or in s.t. at 100° (256) (267), with NH_3 in conc. aq. phenol in s.t. at 100° for 18 hrs. (271), with liq. NH_3 for 24 hrs. (256), or with 5 moles aq. $(NH_4)_2CO_3$ for 5–6 hrs. at 85–110° (160) see indic. refs.]

[For formn. of benzylamine from reaction of C̄ with K phthalimide at 170–180° followed by hydrolysis of the *N*-benzylphthalimide (*see below under* Ⓓ*'s*) *with fumg.* HCl at 200° for 2 hrs (272) cf. (273) (274), with silver cyanate followed by hydrolysis with alkali (275) (276) cf. (268) (277), with acetamide followed by hydrolysis with alc. KOH (278), or with hexamethylenetetramine followed by hydrolysis with alc. HCl (279) see indic. refs]

[For formn. of tribenzylamine from reaction of C̄ with $NaNH_2$ at 120° for 24 hrs. see (261) (280)]

With hydroxylamine. [C̄ with $NH_2OH.HCl + Na_2CO_3$ in aq. alc. under reflux gives (281) (282) (283) (284) *N,N*-dibenzylhydroxylamine [Beil. XV-19, XV_1-(9)], m.p. 124° (284), 123–124° (285), 123° (281); note that the isomeric *O,N*-dibenzylhydroxylamine [Beil. XV-21], oil, b.p. 145–146° at 3 mm. (286), is obtd. indirectly. — C̄ with acetone oxime refluxed in 75% AcOH *gives (287) (as the hydrochloride) N-benzylhydroxylamine [Beil.* XV-17, XV_1-(8)], m.p. 57° (288), 56–58° (289) (B̄.HCl, m.p. 110° (288)). — Various other benzylated hydroxylamines cannot be discussed here.]

With hydrazine. [C̄ with alc 50% hydrazine hydrate under reflux gives (290) *N,N*-dibenzylhydrazine [Beil. XV-533, XV_1-(164)], m p. 65° (B̄.HCl, m.p. 202° (292), 200° (290)); note that the isomeric *N,N'*-dibenzylhydrazine [Beil. XV-534, XV_1-(166)], m.p. 47° (291) (B̄ HCl, m.p. 225° (293)), is prepd. indirectly. — Various other benzylated hydrazines *cannot be discussed here.*]

With metals. *Sodium* [C̄ with Na at 30° on stdg gives (294) encrustation of $NaCH_2$-C_6H_5 [Beil. XVI_1-(589)]; the solid is wine red within 5 hrs , red-violet in 12 hrs., blue-violet in 36 hrs., and finally blue-black; and the sodium benzyl can be isolated as a blue-violet solid stable in air (294) — C̄ with Na at 100° (295) in a mixt. of C_6H_6 and toluene *(296) or in toluene (297) gives* dibenzyl (1:7149). — C̄ *with* Na in liq. NH_3 *loses its halogen* quantitatively (298) giving (50% yield (299)) dibenzyl (1:7149) accompanied by toluene and other products. — For study of free benzyl radical from C̄ with Na vapor in helium see (302)]

[C̄ with Cu powder in s.t. at 150–160° for 12 hrs (300), or C̄ with Al powder (pretreated with H_2 at 500°) *refluxed at 200° for 1 hr (301), gives (60% yield (301)) dibenzyl (1:7149).]*

Magnesium [C̄ as vapor passed over htd. Mg gives (303) magnesium allylide which with aq yields methylacetylene ("allylene").]

[C̄ with Mg in dry ether gives (304) (305) (306) C_6H_5 CH_2MgCl: for study of optimum conditions (311) giving yields of 94.28% (307), 93.2% (308), 91 0–94.1% (309), 90.7–91.2% (310) *see indic. refs.; for study of effect of nature of Mg (312), of use of* ether/hydrocarbon mixts. as solvent (313), of stability toward long boilg in ether or ether/benzene (314) see indic. refs., for further examples of practical prepn. of $C_6H_5.CH_2MgCl$ see (315) (316). — Note that some dibenzyl (1:7149) (e.g., 9.4% (317)) and di-*p*-tolyl (4,4'-dimethylbiphenyl) (318) are also formed and the yield of dibenzyl is greatly increased in pres. of cat. such as $CuCl_2$, $HgBr_2$, $FeCl_3$, $FeBr_3$ (319), *or* $MoCl_5$ (320).]

An exhaustive treatment of the behavior of $C_6H_5.CH_2MgCl$ (hereafter called RMgCl) is far beyond the scope of this book, but the following examples will be useful and will serve as lead references; for further examples see Beil. XVI-939, XVI_1-(554) and subsequent literature.

[RMgCl with O_2 gives (80% *yield (321)) cf (322) benzyl alcohol (1:6480).* — RMgCl (1 mole) gives (84% yield (323)) (324) (325) $C_6H_5CH_2HgCl$, m.p. 104° (323) (324) (326), but excess RMgCl with $HgCl_2$ gives (326) (325) (327) dibenzyl mercury, m p. 111° (326). — RMgCl with $SbCl_3$ gives (328) tribenzylstilbene, m.p. 107–108°. — RMgCl with $ClNH_2$

[$\bar{C}$ with benzyl alc./$NaOCH_2C_6H_5$ in ether (415), with solid KOH at 180–200° (416), with conc. aq. NaOH at 90–120° (416), or with K benzylate in liq. NH_3 (408) gives dibenzyl ether (1:7640).]

With phenols (or phenolates). $\bar{C}$ with phenols may react either with phenolic or nuclear hydrogen giving respectively benzyl aryl ethers or benzylated phenols; moreover, the former may, under appropriate conditions, be rearranged to the latter; examples of all these types of reaction are included below.

[$\bar{C}$ with K phenolate (111) (418) or Na phenolate (417) in boilg. alc., or $\bar{C}$ with phenol in boilg. alc. NaOMe or NaOEt (419) (420), boilg. aq. NaOH (160) (421), or boilg. acetone + K_2CO_3 (422) gives (73% yield (421)) benzyl phenyl ether [Beil. VI-432, VI_1-(220), VI_2-(411)], m.p. 39° (418) (420) (421) (422), 38–39° (401); b.p. 286–287° (401), 286–288° (419), 178–179° at 35 mm. (422), 124–125° at 4 mm. (417). — Note that although this prod. is completely stable to distn. (419) yet on htg. with $ZnCl_2$ or in dry HCl as directed (421) it undergoes rearr. (accompanied by some cleavage) giving 2-benzylphenol (1:1431), 4-benzylphenol (1:1485), 2,4-dibenzylphenol (see below), and other prods.]

$\bar{C}$ under suitable conditions also effects nuclear benzylation of phenol yielding a mixt. of *o*-benzylphenol (1:1431) and *p*-benzylphenol (1:1485) (the latter usually predominating) accompanied by polybenzylphenols and other products. [E.g., $\bar{C}$ with phenol (1:1420) directly at 125° (423) or 150–180° (160), or in pres. of Cu powder at 115–120° (160), Ce at 120–130° (424), Ti (393), $AlCl_3$ in pet. ether (425), Zn at room temp. (426) (427) (428) (429) in solvent media such as C_6H_6, toluene, $CHCl_3$, or EtOH (430), $ZnCl_2$ on warming (421) (431) (432), 38% HCl in s.t. at 100° (421), P_2O_5 (434) or PCl_5 (435) in toluene at 130–135°, or $\bar{C}$ with Na phenolate (or phenol + Na) in dry toluene (419) (436) (437) gives *o*-benzylphenol + *p*-benzylphenol (accompanied by other products). — For sepn. of the two benzylphenols by formn. of Na salt of latter in toluene see (438).]

Other phenols, cresols, naphthols, etc., behave analogously but cannot be discussed here.

With phenol ethers. With phenol ethers (where no phenolic H atom is available for reaction) $\bar{C}$ effects nuclear benzylation. [E.g., $\bar{C}$ with methyl phenyl ether (anisole) (1:7445) refluxed 2–3 hrs. (391), or in pres. of Zn (439), Ti (393), Ce (424), W (365), $AlCl_3$ (440), or $ZnCl_2$ + dry HCl (421) gives (yields: 63% (393), 57% (424), 52.9% (365)) *p*-benzylanisole [Beil. VI-676, VI_1-(325), VI_2-(630)], b.p. 305–308° (425), 191–193° at 38 mm. (391), 172–174° at 10 mm. (421), 157–158° at 8 mm. (411), 133–135° at 4 mm. (425); m.p. 20–21° (441).]

[$\bar{C}$ with phenetole (1:7485) in pres. of Ti (393), U (365), or Ce (424) as directed gives (yields: 76% (393), 80% (365), 88% (424)) *p*-benzylphenetole [Beil. VI-676, VI_2-(630)], b.p. 317° (442), 315–317° (425), 217° at 37 mm. (442), 203° at 12 mm. (442), 171–173° at 12 mm. (425).]

With organic acids (or their salts). *KCN or NaCN.* [$\bar{C}$ with alc. KCN (443) (444) (445) (446) in pres of CuCN and in u.v. light (447), or $\bar{C}$ with aq. alc NaCN (160) (448), gives (yields: 80–90% (448), 70–76% (447), 70% (160)) benzyl cyanide (α-tolunitrile) (phenylacetonitrile) [Beil. IX-441, IX_1-(176)], b.p. 233–234° cor. (3), 231–232° at 755 mm. (449), 135–140° at 38 mm. (448), 118–119° at 20 mm. (450), 107–107.4° at 12 mm. (18); f.p. −24.6° (26), −26.5° (451); $D_4^{25} = 1.0125$ (452), $D_4^{20.2} = 1.0176$ (453), 1.0157 (454); $n_D^{25} = 1.52105$ (455), $n_D^{20.2} = 1.52422$ (453); for removal from this prod. of traces of benzyl isocyanide with aq. H_2SO_4 at 60° see (456).]

With salts of aliphatic acids. [$\bar{C}$ with Na formate + anhydrous formic acid in s.t at 140° (402) gives benzyl formate (1:3596) q.v.]

[$\bar{C}$ with KOAc in alc. (443) (457) (460) or benzyl acetate itself (458), or $\bar{C}$ with $Pb(OAc)_2$ in AcOH (459), or $\bar{C}$ with NaOAc in AcOH (461) cf. (160) or aq at 115° (160), gives (80% yield (160)) benzyl acetate (1:3751) q.v.; for study of kinetics see (22).]

BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

With hydrocarbons. $\bar{C}$ with benzene (1:7400) in pres. of widely varied condensing agts. gives diphenylmethane (1.7120), frequently accompanied by *o*-dibenzylbenzene [Beil. V-710, V_1-(351), V_2-(621)], m.p 78–79°, and by *p*-dibenzylbenzene [Beil. V-711, V_1-(351), V_2-(621)], m p. 86°. — [E g , $\bar{C}$ with benzene (1·7400) in pres. of Zn dust (363) (369), Cr powder (364), uranium dust at 100° for 4 hrs. (365), Al powder (preheated in H_2 at 500°) (301), Ti (393), Al/Hg (366) (367), Al + $HgCl_2$ (368), Al + HCl (368), $AlCl_3$ (369) (370), $AlCl_3$/nitrobenzene cpd. at 30° (372), NaCl.$AlCl_3$ at 15–20° (373), $BeCl_2$ at 100° for 6 hrs. (374), $TiCl_4$ (375), $ZrCl_4$ (376), $SnCl_4$/diethyl etherate (377), $TlCl_3$ (378), iron pyrites (97), Ag_2SO_4 (379), silver methionate (neutral silver salt of methanedisulfonic acid) (379), P_2O_5 (380), or HF in Cu bomb at 100° for 15 hrs (381) gives (yields: 60–63% (368), 60% (372) (374), 56% (381), 52% (373), 49.5–52.5% (366), 40% (365), 38% (301), 35% (375), 30% (376), 22% (363)) diphenylmethane (1:7120).]

[$\bar{C}$ with toluene (1:7405) in pres. of Zn dust (382) cf. (383) (384), Ti (393), $AlCl_3$ (369) (370) cf. (385) (386) (371), Al/Hg (367), $FeCl_3$ (385) (386), $BeCl_2$ at 110–125° (374), or MeMgI (387) gives *p*-benzyltoluene [Beil V-607, V_1-(286), V_2-(511)], b.p. 279°.]

[$\bar{C}$ with *m*-xylene (1:7420) in pres. of Zn dust (388), finely divided Cu (389), or $BeCl_2$ at 130–140° (374) gives (73.6% yield (384)) phenyl-*m*-xylyl-methane [Beil. V-615, V_1-(289), V_2-(518)], b.p. 295–296° cor. (388) (389)]

[$\bar{C}$ with mesitylene (1.7455) refluxed 60 hrs. without cat. (391), or in pres. of $AlCl_3$ (390) at 98–100°, or $BeCl_2$ at 140–160° (374), gives (78% yield (374)) benzylmesitylene (phenyl-2,4,6-trimethylphenyl-methane) [Beil. V-619], m p. 36–37° (390), 36° (374)]

[$\bar{C}$ with biphenyl (1:7175) refluxed 3 hrs without cat. (391), or in pres. of Zn dust at 100° (392), or of Ti (393) gives 4-benzylbiphenyl [Beil V-708, V_2-(618)], m.p. 85° (392) (391).]

[$\bar{C}$ with naphthalene (1:7200) refluxed 3 hrs. without cat. (391), or in pres of Zn dust (394) (395), $ZnCl_2$ (396) at not over 125° (397), $AlCl_3$ (396) (398), Ti (393), or P_2O_5 at 200° (380) gives mainly 1-benzylnaphthalene [Beil. V-689, V_1-(341), V_2-(604)], m.p. 59° (corresp. picric acid addn. cpd., m p. 100–101° (396) (400)), accompanied by some 2-benzylnaphthalene [Beil. V-690], m p. 55–55.5° (398), 55 5° (399) (corresp picric acid addn. cpd., m.p. 93° (396) (400)). — Note that using $ZnCl_2$ little 2-benzylnaphthalene is formed (398), also that polybenzylation may occur (399).]

With alcohols (or alcoholates). [$\bar{C}$ with MeOH/KOH (401) or with MeOH/NaOMe (403) in s.t at 120° (402) gives benzyl methyl ether (1.7475), b.p. 170–171° cor. (403), 170 5° cor. at 760 mm. (3), 170–171° at 759 mm. (377), 170 2–172 2° at 760 mm (404); D_4^{25} = 0.9745 (405), 0 9594 (403), D_4^{20} = 0 9649 (403); n_D^{25} = 1.4983 (403), n_D^{20} = 1.5031 (405), 1.5008 (403) (corresp. picrate, m.p. 115–116° u c (406)). — $\bar{C}$ with EtOH/KOH (401), EtOH/NaOEt (403) (377) (407), EtOH/LiOEt (407), or KOEt/liq. NH_3 (408) gives (yields: 81% (408), 63–77% (407)) benzyl ethyl ether (1:7530); b.p. 184 7–185 2° at 761 mm. (377), 184–186° cor. (403); D_4^{25} = 0 9446 (403), D_4^{20} = 0.9490 (409), 0.9478 (403); n_D^{25} = 1.4934 (403), n_D^{20} = 1.4958 (403), 1 4955 (409). — For studies of rate of reaction of $\bar{C}$ with EtOH (410) (411) or with EtOH/NaOEt (412) see indic refs.]

[$\bar{C}$ with *n*-PrOH/NaO-*n*-Pr gives (90–93% yield (413) (403)) benzyl *n*-propyl ether [Beil. VI-431, VI_1-(219), VI_2-(410)], b.p. 200–202° cor. (403), 68° at 9 mm. (413); D_4^{25} = 0.9480 (403), D_4^{20} = 0 9535 (403) cf. (413); n_D^{25} = 1 4932 (403), n_D^{20} = 1.4953 (403), 1.4905 (413); for study of rate at 50 6° see (414). — $\bar{C}$ with iso-PrOH/NaOisoPr gives (403) benzyl isopropyl ether, b.p. 192–194° cor.; D_4^{25} = 0.9403, D_4^{20} = 0.9457; n_D^{25} = 1.4876, n_D^{20} = 1.4900 (403)]

[For corresp. prepn. and constants for benzyl *n*-butyl ether (403) (417), benzyl *sec*-butyl ether (417), benzyl isobutyl ether (403), and benzyl isoamyl ether (403) see indic. refs.]

[C̄ with $C_2H_5NH_2$ in 33% aq. soln. with some alc. in s.t. at 110° gives (558) *N*-ethylbenzylamine [Beil. XII-1020, XII_1-(448)], oil, spar. sol. aq., b p. 199° (539), 198° at 750 mm. (550), 194° cor. (558), 191–194° u c. at 740 mm. (548); $D_{15}^{16.7}$ = 0 9350 (552) (B̄.PkOH, m.p. 122–123° (559)), accompanied by *N*-ethyldibenzylamine [Beil. XII-1036], b p. 306° cor. (558).]

With aromatic primary amines. [C̄ (1 mole) with aniline (2 moles) in s t. at 160° for 24 hrs. (502), or htd. in open vessel at 140° (503), or in pres. of I_2 at 50° (504), in alc. (505) or aq. Na_2CO_3 (160), or C̄ (1 mole) with aniline (4 moles) in aq. $NaHCO_3$ at 90–95° (506), or C̄ with sodium anilide (from aniline + Na + Cu_2O) at 30–100° under press., (507) gives (yields: 85–87% (506), 56% (160), 49% (504)) *N*-benzylaniline (*N*-phenylbenzylamine) [Beil. XII-1023, XII_1-(449)], m.p. 39° (508), 37–38° (509), 37° (510), 36.5–36 8° cor. (503), 36 5° (511), 36° (506) (512); b p. 306–307° at 759 mm. (509), 201–203° at 37 mm. (510), 178–180° at 12 mm. (506), 171.5° at 10 mm. (508); D_4^{65} = 1.0298 (508); n_D^{65} = 1.59562 (508) (B̄.HCl, m.p. 214–216° (509), B̄.3,5-dinitrobenzoic acid, m p. 133.0° cor. (249), B̄.2,4-dinitrobenzoic acid, m.p. 121.4–122.2° cor. (513), B̄.*p*-toluenesulfonic acid, m.p. 148 3–148.8° cor. (250)); for method of sepn of *N*-benzylaniline from *N*,*N*-dibenzylaniline (below) by reactn. with phthalic anhydride (1:0725) see (514). — For studies of kinetics of reaction of C̄ with aniline in MeOH at 35° and 45° (515) or in EtOH at 35°, 40°, and 45° (516) cf. (4) see indic. refs.; for study of rearr. of *N*-benzylaniline to *p*-aminodiphenylmethane see (517)]

[C̄ with aniline on htg cf. (503) (508) in pres of NaOH at 100° (518), anhydrous NaOAc + I_2 at 97° (504), $NaNH_2$ + Cu powder (519), benzyl alc. (520), or aq. Na_2CO_3 (160) gives *N*,*N*-dibenzylaniline (*N*-phenyldibenzylamine) [Beil. XII-1037, XII_1-(453)], m.p. 71–72° *(521), 70° (522), 69.5° (508), 69° (520), 67° (518)*; b p. 226° at 10 mm. (508); D_4^{80} = *1.04436*; n_D^{80} = 1.60647 (508) (B̄.HCl, pr. with 1 H_2O from alc (518), but m.p. unreported; B̄ PkOH, m.p. 131–132° dec. (518); B̄.3,5-dinitrobenzoic acid gives no cpd. (249); B.2,4-dinitrobenzoic acid gives no cpd. (513); B̄.*p*-toluenesulfonic acid is oil (250); 2B̄.1,3,5-trinitrobenzene, m.p. 86–87° (523)). — For study of rearr. of *N*,*N*-dibenzylaniline hydrochloride to *p*-aminodiphenylmethane, 2,4-dibenzylaniline, and 2,4,6-tribenzylaniline see (524).]

C̄ with other aromatic primary amines behaves similarly but cannot be detailed here; however, for a number of cases see (508).

With aliphatic secondary amines. [C̄ with $(CH_3)_2NH$ in abs. alc. on stdg. (560) or under reflux (546) (561), or in C_6H_6 at 40–50° for 2 days (562), gives (80% yield (561)) *N*,*N*-dimethylbenzylamine [Beil. XII-1019, XII_1-(448)], oil, fairly sol. cold but less sol hot aq., b.p. 183–184° cor. at 765.3 mm. (560), 180–181° at 749 mm. (540), 178–179° cor. (563), 177.8–178.2° cor. at 766 mm. (561), 178° u c. (562), 98–99° at 24 mm. (564), 83 5–85.5° at 21 mm. (565), 66–67° at 15 mm. (566), n_D^{20} = 1.5157 (564) (B̄.HCl, m.p. 175° (562) cf. (566); B̄.PkOH, m.p. 94° (532), 94–95° (559)).]

[C̄ with $(C_2H_5)_2NH$ in s.t. at 100° gives (567) (568) *N*,*N*-diethylbenzylamine [Beil. XII-1021, XII_1-(448)], oil, spar. sol. aq., b.p. 212° (569), 211–212° (568) cor. (567), 209° (570) at 755 mm. (551), 96–98° at 17 mm. (564), 94° at 15 mm. (555) (B̄.PkOH, m.p. 120–121° (571), 119° (566)).]

With aromatic secondary amines. [C̄ htd. with *N*-methylaniline at 100° (521) (525) in pres. of aq. Na_2CO_3 (160), or C̄ with *N*,*N*-dimethylaniline + I_2 at 150° (504), or C̄ with mixt. of *N*-methylaniline and *N*,*N*-dimethylaniline at 150° (526), gives (yields: 92.5% (526), 60% (525), 41% (521)) *N*-benzyl-*N*-methylaniline (benzyl-methyl-phenylamine) [Beil. XII-1024, XII_1-(450)], b p. 305–306° (527), 187–188° at 26 mm. (525), 177–178° at 18 mm. (526), 171° at 13 mm. (528), 162–163° at 8 mm. (504); $D_{25}^{26.5}$ = 1.0421 (504), D_4^{15} = 1.0475 (528); $n_D^{29.5}$ = 1.6006 (504), 1.6071 (528). (B̄ PkOH, m p *131° (529), 128–128.5° (504),* 127° (525), 109° (530), 105–107° (531), 104° (532), 103.0–103 5° (533); note disagreement)]

[C̄ htd. with *N*-ethylaniline (534) in toluene + Na_2CO_3 (535), or C̄ with *N*,*N*-diethylan-

[C̄ with alc. K propionate (460) or with aq. Na propionate (160) gives benzyl propionate [Beil. VI-436, VI_1-(220), VI_2-(416)], b.p. 222°]

[C̄ with alc. K *n*-butyrate (460), or aq. Na *n*-butyrate (160), gives benzyl *n*-butyrate (1:3977).]

C̄ with salts of other aliphatic acids behaves similarly but detailed treatment will not be given here.

With salts of aromatic acids. [For extensive study of reaction of C̄ with NaOBz giving benzyl benzoate (1:4422) see (462) (629).]

With salts of enolic esters. [C̄ with diethyl sodiomalonate gives (yields: 87% (463), 85% (464), 60% (471), 51–57% (465), 50% (470)) (466) diethyl benzylmalonate [Beil. IX-868, IX_1-(381)], b.p. 300° (466), 296–298° (467), 195° at 22 mm. (463), 163° at 14 mm. (468), 170° at 13 mm. (469), 169° at 12 mm. (470) (471), 158° at 8 mm. (472), 128–133° at 6 mm. (473), 145–155° at 5 mm. (465), 150–152° at 4 mm. (474), 140–140.5° at 1.5 mm. (474), 105–108° at 1 mm (475) (476); D_4^{20} = 1.0750 (468); $n_D^{26.5}$ = 1.484 (475) (476), n_D^{20} = 1.4872 (468). This prod. on alk. hydrolysis (for study of kinetics see (477)) and subsequent acidification gives benzylmalonic acid [Beil IX-868, IX_1-(381)], cryst. from ether, C_6H_6, or $CHCl_3$/pet. ether, m.p. 120.6° (478), 120° (479), 120° dec. (468), 119–120° (480), 117–118° (472), 117° (466) (467); on htg. above its m.p. (480) this acid readily loses CO_2 yielding hydrocinnamic acid (1:0615), m.p. 48°.]

[C̄ with Na enolate of diethyl benzylmalonate (above) (482) (485), or C̄ with diethyl disodiomalonate (483), or C̄ with diethyl ethoxymagnesiomalonate (484), gives (yields: 85% (483), 84–87% (485)) diethyl dibenzylmalonate [Beil. IX-937, IX_1-(408)], b.p. 250° at 40 mm. (482), 256–257° at 38 mm. (486), 234–235° at 23 mm. (485), 224–226° at 15 mm. (484), 221° at 11 mm. (483), 192–193° at 2 mm. (487); m.p. 13–14° (486); D_4^{20} = 1.0930 (482). Note that this prod. always accompanies the diethyl benzylmalonate of preceding paragraph. Diethyl dibenzylmalonate with alc. alk. hydrolyzes with great difficulty (488) (485) but gives dibenzylmalonic acid [Beil IX-937, IX_1-(407)], m.p. 175° (485), 174° (488), which on htg. above its m.p. loses CO_2 giving dibenzylacetic acid (1:0668), m.p. 89°.]

[C̄ with ethyl sodioacetoacetate as directed (489) (490) (491), or C̄ with ethyl acetoacetate + BF_3 (492), gives (yields: 70% (491), 23% (492)) ethyl α-benzylacetoacetate [Beil. X-710], b.p. 283–284° u.c. (493), 276° (490), 157–158° at 14 mm. (494), 164–165° at 12 mm. (493), 163–165° at 12 mm. (491), 140–150° at 2–3 mm. (473) (corresp. 2,4-dinitrophenylhydrazone, m.p. 71.5° (473)). For ketonic cleavage of this prod. with 20% aq. NaOH (495) or aq in s.t. at 250° (496) giving benzylacetone [Beil. VII-314, VII_1-(167)], b.p. 236°, see indic. refs.]

[C̄ with ethyl acetoacetate as directed (497) cf. (501) or C̄ with ethyl α-benzylacetoacetate (above) as directed (489) (493) (498) (499) gives (58% yield (497)) ethyl α,α-dibenzylacetoacetate [Beil. IX-771], m.p. 57° (493) (497) (500), b.p. 230–234° at 12 mm. (493) cf. (497). For ketonic cleavage of this prod. with HI/AcOH giving (80% yield) α,α-dibenzylacetone, b.p. 190–192° at 15 mm., see (497); for acid cleavage giving dibenzylacetic acid (1:0668) see (500) (501).]

With amines. *With aliphatic primary amines.* [C̄ with [illegible]
in abs. EtOH gives (546) cf. (554) *N*-methylbenzylamine [illegible]
sol. aq., b.p. 184–186° (547) (554), 184–185° u.c. at 749 m[illegible]
(550), 180–181° cor at 765.5 mm. (546), 180° at 760 [illegible]
(B̄.HCl, 195° (554), 174–175° (546); B̄.PkOH, m.p. 117–118° (532), 113–116° (553)) Note that this prod. is usually accompanied by some *N*-methyl-dibenzylamine [Beil. XII-1036, XII_1-(453)], b.p. 304–305° cor. at 765.5 mm. (546), 165° at 15 mm (555), 161–162° at 12 mm. (556) (B̄.HCl, m.p. 200–201° (556); B̄.PkOH, m.p. 107° (557)), also obtd. from C̄ with *N*-methylbenzylamine (above) in pres. of NaOH at 145° for 4 hrs. (555).]

iline + I_2 at 150° (504), or C̄ with a mixt of N-ethylaniline + N,N-diethylaniline at 150° (526), gives N-benzyl-N-ethylaniline (benzyl-ethyl-phenylamine) [Beil. XII-1026, XII_1-(450)], b p. 285–286° sl. dec. at 710 mm. (534), 212–220° at 54 mm. (526), 185 5–186 5° at 22 mm. (535) (536), 173° at 12 mm. (528), 163–164° at 6 mm. (504); D_4^{15} = 1.0330 (528); n_D^{15} = 1 5975 (528) (B̄.PkOH, m.p 116–117° (536), 114° (535), 113–114° (504), 111–112° (533)). — For important study of sulfonation of N-benzyl-N-ethylaniline see (537).]

With heterocyclic secondary amines. [C̄ with piperidine reacts vigorously giving (538) (541) (542) N-benzylpiperidine [Beil. XX-23, XX_1-(8)], b.p. 248° (539), 245–247° (540), 245° (538) (541), 119° at 13 mm (542); D_4^{20} = 0 96049 (542), D_4^{16} = 0.9625 (541), D_4^{15} = 0.96451 (542); n_α^{20} = 1 52269 (542) (B̄ HCl, m p. 178° (543)).]

[Direct reaction of C̄ with morpholine appears never to have been reported; the expected product, viz , N-benzylmorpholine [Beil XXVII-7, $XXVII_1$-(203)] (544), has, however, been prepd by many other methods and has following constants: b p. 260–261° cor. (545), 136–136 5° at 14 mm. (544), 128–129° at 13 mm. (542); D_4^{20} = 1.03874, D_4^{15} = 1.03396 (542) (B̄ HCl, m p. 244–245° dec (545), B̄ PkOH, m p 193 5–195° cor (544), 184–185° (545))]

With aliphatic tertiary amines. [C̄ with $(CH_3)_3N$ in abs. alc. (546) (561) (563) or abs. MeOH at 0° (572) gives trimethyl-benzyl-ammonium chloride [Beil. XII-1020, XII_1-(448)], m p 235° (572) dec (546); for studies of behavior of this prod toward cat. hydrogenation see (573) (574)]

[C̄ with $(C_2H_5)_3N$ directly (563) or at 100° in s.t (567) cf (570) gives triethyl-benzyl-ammonium chloride [Beil XII-1021], but its constants are not reported]

With aromatic tertiary amines [C̄ with N,N-dimethylaniline at ord. temp. (575) (577) in MeOH or EtOH (576) gives dimethyl-phenyl-benzyl-ammonium chloride [Beil. XII-1025, XII_1-(450)], tbls of monohydrate from aq. or alc , m p 110° (575), 109.5° (578), m.p. anhydrous form, 116° (577); for studies of rate of formn. of this salt in MeOH at 29° and 38° see (579), for studies of behavior on cat hydrogenation see (573) (580); for use of this quaternary salt as reagt. for introduction of benzyl radical see (473)]

[C̄ with N,N-diethylaniline in dry C_6H_6 refluxed 30 min gives (581) diethyl-phenyl-benzyl-ammonium chloride, m p 104° (581)]

With heterocyclic tertiary amines. [C̄ with pyridine directly (582) (583) (584) (585) (586) or on htg at 150° for 6 hrs. (587) gives N-benzylpyridinium chloride [Beil XX-218, XX_1-(74)], but this salt is difficult to crystallize (586) and its properties are not well established; for kinetics of the addition see (4) (579) — Note that C̄ with pyridine in pres. of Cu on htg gives (588) a mixt. of 2-benzylpyridine and 4-benzylpyridine, but this type of nuclear benzylation cannot be discussed here]

With arylhydrazines. C̄ (1 mole) with phenylhydrazine (2 moles) mixed with cooling (589) and subsequently htd at 115–120° (590) (591) (592), or refluxed in alc. (593), or C̄ with phenylhydrazine + Na in C_6H_6 (594) or liq. NH_3 (595), or C̄ with phenylhydrazine + $NaNH_2$ in liq NH_3 (73% yield (595)), gives N-benzyl-N-phenylhydrazine (α-benzyl-phenylhydrazine) [Beil XV-532, XV_1-(164)], oil, b p. 216–218° at 38 mm (591), 207–208° at 10 mm. (593) (B̄ HCl, m p. 176–177° (596), 170° (593), 164–169° (595), 167° (594) (595), 166–167° (590); corresp. acetyl deriv., m.p. 121–122° (594) (595); corresp benzoyl deriv., m.p. 139–140° (590)); note that the N-benzyl-N-phenylhydrazine is often accompanied (593) (591) by some benzaldehyde N-benzyl-N-phenylhydrazone, m.p. 111–112° (590), 111° (593) (594). — The isomeric N-benzyl-N′-phenylhydrazine (β or *sym.*-benzyl-phenylhydrazine) [Beil XV-533, XV_1-(165)], m.p. 35–36°, is not obtd. by benzylation of phenylhydrazine but only by indirect methods.]

[For analogous use of C̄ in prepn of *asym*-benzyl-o-tolylhydrazine, *asym*-benzyl-m-tolylhydrazine, *asym*-benzyl-p-tolylhydrazine, etc , see (597)]

With arylhydroxylamines. [C̄ with N-phenylhydroxylamine in pyridine as directed

Colorless crystals from alc. (2).

[For prepn. of C̄ (30–50% yield of mixed solid + liquid stereomers (2)) from 1,2-dichloroethylene (3:5030) + 1,1,2-trichloroethane (3:5330) + 1% $AlCl_3$ for 5 days at 35–40° see (2); for formn. of C̄ from 1,2-dichloroethylene (3:5030) with HCl + $AlCl_3$ at 50° see (1).]

C̄ in CCl_4 treated with $AlCl_3$ remains colorless and the solution does *not* (2) evolve HCl, even on boilg.

C̄ in alc. treated with Zn dust gives (80% yield (2)) 1-chlorobutadiene-1,3 (3:7210), b.p. 68° (2).

C̄ dissolved in hot alc. and titrated with $N/10$ KOH splits off 1.44–1.50 moles HCl (2).

[A pentachlorobutane obtained (3) from trichloroethylene (3:5170) + 1,1-dichloroethane (3:5035) + $AlCl_3$ may or may not be identical with C̄.]

3:0750 (1) Müller, Hönn, *J. prakt. Chem.* (2) **128**, 289–290 (1932). (2) Prins, *Rec. trav. chim.* **56**, 121–123 (1937). (3) Consortium für Elektrochem. Ind., Brit. 453,414, Oct. 8, 1936; *Cent.* **1937**, I 1012.

3:0765 p-CHLOROBENZALDEHYDE ClCHO C_7H_5OCl Beil. VII - 235
VII₁-(133)

M.P.	49°	(1)	B.P. 214.5–216.5°	at 760 mm.	(3)
	48°	(2) (3)	213–214°		(6) (8)
	47.5°	(4) (6)	213°	at 748 mm.	(9)
	47°	(5)	108–111°	at 25 mm.	(7)
	46–47°	(7)			

Colorless pl. with odor like benzaldehyde. — Volatile with steam. — Somewhat sol. cold aq., more sol. hot aq.; eas. sol. alc., ether, C_6H_6, CS_2, AcOH. — Forms spar. sol. $NaHSO_3$ cpd.

[For prepn. of C̄ from *p*-chlorotoluene (3:8287) with CrO_2Cl_2 (10), or by halogenation to *p*-chlorobenzal (di)chloride (3:6700) (7) (46) or *p*-chlorobenzal (di)bromide (11) and their subsequent hydrolysis with fumg. H_2SO_4 (6) (12) (13), conc. H_2SO_4 (7), anhydrous oxalic acid (8), or water in a s.t. at 170° (14) (15) see indicated refs.; from *p*-aminobenzaldehyde by diazotization and reactn. with CuCl (73% yield (16)) see (16) (17) (1); from *p*-chlorobenzyl chloride (3:0220) (or bromide) by boilg. with aq. $Pb(NO_3)_2$ in CO_2 (4) (5) or with hexamethylenetetramine (2); from *p*-chlorobromobenzene via *p*-chlorophenyl MgBr and its reactn. with ethyl orthoformate *(64% yield) (18)*; from *p-chlorobenzonitrile with* $SnCl_2$ (19); from chlorobenzene + HCN + $AlCl_3$ (20) or with CO + $AlCl_3$ (21); from *p*-chlorobenzylamine with hexamethylenetetramine (45) see indic. refs.]

C̄ with $KMnO_4$ (2) (4) (5) or even slowly in air oxidizes to *p*-chlorobenzoic ac. (3:4940), m.p. 236°. [For study of auto-oxidation see (22).] — C̄ on cat. hydrogenation (92% yield (23)) or electrolytic reductn. (24) or by actn. of iodo-magnesium hydrobenzoinate (84% yield (25)) gives *p*-chlorobenzyl alc., ndls. from C_6H_6/lgr., m.p. 71–72.5° (23). — C̄ with conc. alk. undergoes Cannizzaro reactn. (for study see (26) (28)) although presumable products, *p*-chlorobenzyl alc. and *p*-chlorobenzoic ac., have not been (by this reactn.) actually isolated. [For study of C̄ in mixed Cannizzaro reactn. see (27).]

C̄ on reduction with Ni/Al alloy (Raney Ni) in aq. alk. gives (60% yield (48)) toluene (1:7405).

C̄ with dil. KCN gives benzoin condensation yielding 4,4′-dichlorobenzoin, m.p. 85–87° (29), which on oxidn. with HNO_3 in AcOH yields 4,4′-dichlorodibenzil, m.p. 195–196° (29).

C̄ on htg. with NaOAc + Ac_2O for 8 hrs. at 180–200° undergoes Perkin reactn. giving (yield: 52% (13), 60% (17)) *p*-chlorocinnamic ac., m.p. 249–250° (17), 247° (13) (31). [This with Br_2 in $CHCl_3$ gives (30) *p*-chlorocinnamic acid dibromide, m.p. 191° (30).] — C̄ + malonic acid + pyridine gives alm. quant. yield (31) *p*-chlorocinnamic acid. [With-

3:8538 ETHYL β-CHLOROCROTONATE $C_6H_9O_2Cl$ Beil. II - 416, II_1-(189), II_2-(396)

CH_3—C—Cl
‖
H—C—$COOC_2H_5$

B.P. [184° cor.	(1)]	D_4^{20} = 1.106 (3) (4)	n_D^{20} = 1.4587	(3)
179–180°	(2)	1.101 (7)		
77° at 15 mm.	(3)	$D_4^{19.2}$ = 1.1018 (7)	$n_D^{19.6}$ = 1.4588	(4)
76–77° at 14 mm.	(4) (5)			
75.3–76.0° at 14 mm.	(6)	$D_4^{17.9}$ = 1.1526 (6)	$n_D^{17.9}$ = 1.4509	(6)
66° at 10 mm.	(7)			

[*See also ethyl β-chloroisocrotonate* (3:8325).]

[For prepn. of C̄ from β-chlorocrotonic acid (3:2625) in EtOH with HCl gas (100% yield (2)) (4) or with conc. H_2SO_4 (7) see indic. refs.]

[For formn. of C̄ from ethyl acetoacetate (1:1710) with PCl_5 as a by-product of prepn. of ethyl β-chloroisocrotonate (3:8325) see (8) (9), but this is definitely not a good means of prepn. of C̄.]

[C̄ with Al/Hg in alc. on warming is both dehalogenated and hydrolyzed yielding (10) crotonic acid (1:0425); note that with C̄ this reactn. goes more readily than with the isomeric *ethyl β-chloro-isocrotonate* (3:8325).]

[C̄ (2 moles) with K_2S (1½ moles) in 5 vols. abs. EtOH refluxed 16 hrs. (11) or C̄ with Na enolate of ethyl thioacetoacetate (14) gives (53% yield (11)) diethyl β,β′-thiodicrotonate

$S(—C(CH_3)=CH.COOC_2H_5)_2$, b p. 150–153° at 4 mm. (11), accompanied by some ethyl β-mercaptocrotonate (see below).]

[C̄ with alc. NaSH (12) or alc. KSH (11) (13) gives (30% yield (13)) ethyl β-mercaptocrotonate; note that this prod. is apparently a mixt. of the two geom. stereoisomers of ethyl β-mercaptocrotonate with the corresp. keto form, viz., ethyl thioacetoacetate, $CH_3.CS\,CH_2\,COOC_2H_5$; for details see indic. refs — Note also that, since the same prod. results by similar treatment of the isomeric ethyl β-chloroisocrotonate (3:8325), a mixture of the stereoisomers can be used as the starting material.]

[C̄ with alkali derivs. of alcohols, phenols, mercaptans, etc., splits out alkali halide yielding corresp. ethyl β-substituted crotonates: e g., C̄ with Na allylate gives (9) ethyl β-allyloxycrotonate; C̄ with Na cinnamylate gives (9) ethyl β-cinnamyloxycrotonate; C̄ with Na phenolate gives (15) cf (16) ethyl β-phenoxycrotonate, b.p. 147–148° at 14 mm. (15); C̄ with Na salt of ethyl mercaptan gives (17) ethyl β-ethylmercaptoisocrotonate, b.p. 139–141° at 16 mm. (17); C̄ with Na salt of benzyl mercaptan gives (90% yield (17)) ethyl β-benzylmercaptocrotonate, cryst. from lgr., m.p. 64.5° (17). Note that in the first three of the five preceding examples either C̄ or the isomeric ethyl β-chloroisocrotonate (3:8325) or their mixture gives the same result; for the last two, however, such is not the case.]

[C̄ with diethyl sodiomalonate gives (5) cf. (18) *trans* diethyl α-carbethoxy-β-methyl gluconate, $(C_2H_5OOC)_2CH.C(CH_3)=CH\,COOC_2H_5$ [Beil II-853], b p. 169–170° at 13 mm., $D_4^{20} = 1.0937$, $n_D^{20} = 1.4595$ (5); cf. behavior of stereoisomeric ethyl β-chloroisocrotonate (3.8325).]

C̄ with phenylhydrazine gives the same (2) products as obtd. from the stereoisomeric ethyl β-chloroisocrotonate (3:8325): e.g., C̄ (1 mole) with phenylhydrazine (1 mole) at 100° for 6–8 hrs. gives by ring closure mainly (2) 3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-20, $XXIV_1$-(190)], pr. from aq., m.p. 127°, accompanied by small amts of 4-benzeneazo-3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-*328*, $XXIV_1$-(319)], m p. 155–156°, and 3,3′-dimethyl-1,1′-diphenyl-*bis*-pyrazolone-5,5′ [Beil XXVI-484], dec. at high temp. without melting. — Note that with excess phenylhydrazine (2–4 moles) only traces of the 3-methyl-1-phenylpyrazolone-5 are formed while the amt. of the other two (less desirable) products is greatly increased (2).

$$CH_3.CH_2.CH_2.\underset{\displaystyle Cl}{C}H.COOC_2H_5$$

B.P. 185° at 752 mm. (1) $D_-^{11.8} = 1.040$ (1) $n_-^{11} = 1.43071$ (1)

Liq. with peppermint-like odor; insol. aq.; sol. alc., ether.
[For prepn. of $\bar{C}$ from α-chloro-*n*-valeronitrile with abs. EtOH + HCl see (1).]

3:8596 (1) Servais, *Rec. trav. chim.* **20**, 47–48 (1901).

3:8597 ETHYL γ-CHLORO-*n*-BUTYRATE $C_6H_{11}O_2Cl$ Beil. II - 278
II_1-(124)
II_2-(254)

$$\underset{\displaystyle Cl}{C}H_2.CH_2.CH_2.COOC_2H_5$$

B.P. 186°	at 760 mm.	(1)	$D_4^{20} = 1.0754$ (4) $n_D^{20} = 1.43107$ (4)
183–184°		(2)	
77°	at 16 mm.	(3)	
76°	at 16 mm.	(4)	
72°	at 16 mm.	(12)	
70–71°	at 10 mm.	(5)	
64–66°	at 10 mm.	(6)	

[For prepn. of $\bar{C}$ from γ-chloro-*n*-butyric acid (3:0020) with EtOH + H_2SO_4 (80% yield (3)) see (3); from γ-chloro-*n*-butyronitrile with EtOH + HCl see (2); from γ-ethoxy-*n*-butyric acid by htg. with $SOCl_2$ (77% yield) see (5); from ethyl *n*-butyrate (1:3127) with SO_2Cl_2 + dibenzoyl peroxide in CCl_4 (40% $\bar{C}$ + 10% α- and 40% β-isomers) see (7); from γ-ethoxy-*n*-butyryl chloride (12) in almost 100% yield merely by htg. at 100° for 10 hrs. see (12).]

$\bar{C}$ added dropwise to solid KOH at 180° loses HCl and by ring closure yields (8) ethyl cyclopropanecarboxylate [Beil. IX-4, IX_1-(3)], b.p. 134°.

[$\bar{C}$ heated with NaI in acetone yields (5) (6) (9) ethyl γ-iodo-*n*-butyrate, b.p. 69–71° at 3 mm. (5), 84–85° at 4 mm. (9); $\bar{C}$ with excess MeMgI yields (10) 5-chloro-2-methylpentanol-2; $\bar{C}$ with NaN_3 in aq alc. yields (11) ethyl γ-azido-*n*-butyrate; $\bar{C}$ with diethylamine in s.t. at 100° yields (3) ethyl γ-diethylamino-*n*-butyrate, b.p. 73–75° at 4 mm. (5).]

$\bar{C}$ on htg. with conc. HCl yields (5) γ-chloro-*n*-butyric acid (3:0020).

For the amide, anilide, *p*-toluidide, and other derivs. corresp. to $\bar{C}$ see γ-chloro-*n*-butyric acid (3:0020).

Ⓓ 1-Phenylpyrrolidone-2 [Beil. XXI-237]: cryst. from aq., m.p. 69° (12). [From $\bar{C}$ with aniline at 110° for 1 hr. (12).]

3:8600 2-CHLORO-1,4-DIMETHYLBENZENE (*eso*-Chloro-*p*-xylene)

C_8H_9Cl Beil. V - 384, V_1-(186), V_2—

B.P. 186.8°	(1)	M.P. +2° (2)		D_4^{15} = 1.0589 (4)
186° at 767 mm.	(2)	+1.6° (4)		
183.6–185.6°	(3)			
181°	(4)			
183–184°	(5)			

[For prepn. of C̄ from *p*-xylene (1:7415) with Cl_2 in pres. of Fe (82–86% yield (4)) (5) or I_2 (2), by refluxing with $PbCl_4.2NH_4Cl$ (6), with $SO_2Cl_2 + AlCl_3$ (7), or with Cl_2 aq. (1) see indic. refs.; for prepn. of C̄ from *p*-xylidine [Beil. XII-1135, XII_1-(488)] via diazotization and use of Cu_2Cl_2 reaction see (3).]

C̄ on nitration with a mixt. of $HNO_3 + H_2SO_4$ acids as directed (4) (8) gives 5-nitro-2-chloro-1,4-dimethylbenzene, cryst from ether, m p. 77–78° (4), 78° (8) (*accompanied by other products*). [This mononitro-C̄ on further nitration yields 5,6-dinitro-2-chloro-1,4-dimethylbenzene, cryst. from alc., m p. 101° (4).]

C̄ on monosulfonation with fumg H_2SO_4 (2), 100% H_2SO_4 (4), or chlorosulfonic acid (9) yields 2-chloro-1,4-dimethylbenzenesulfonic acid-5 [Beil. XI-127] (corresp. sulfonyl chloride, m.p. 50° (4) (9); sulfonamide, m.p. 185° (4); sulfonanilide, m.p. 155° (4)).

[C̄ on further chlorination yields mainly 2,5-dichloro-1,4-dimethylbenzene [Beil. V-384], m.p. 71° (2) (4), b.p 221° cor. (2), 224° at 770 mm (4) (together with small amts. of other prods.).] [*For side-chain chlorination of C̄ and conversion of resultant prods. by hydrolysis to 2-chlorobenzenedicarboxylic acid-1,4* (chloroterephthalic acid) (3 4995) *see* (10).]

C̄ with Br_2 + Fe (5) or with $Br_2 + HNO_3 + H_2SO_4$ (11) as directed yields 5-bromo-2-chloro-1,4-dimethylbenzene [Beil. V-385], lfts. from hot alc., m p. 66° (5) (11). [Some dibromo-C̄, m.p. 93°, and tribromo-C̄, m.p. 234°, are also formed (5).]

3:8600 (1) Datta, Fernandes, *J Am. Chem. Soc.* **38**, 1811 (1916) (2) Kluge, *Ber.* **18**, 2099 (1885). (11) Varma, Raman, *J. Indian Chem. Soc.* **12**, 245 (1935).

C̄ on oxidn. with dil. HNO_3 in a s.t. yields (2) (3) 3-chloro-2-methylbenzoic acid (3:4435).

[The behavior of C̄ on nitration has not as yet been reported, all three possible mononitro derivatives have, however, been independently prepared; viz., 4-nitro-C̄, m.p. 46° (4); 5-nitro-C̄, m.p. 101° (5); 6-nitro-C̄, m.p. 62° (6).]

C̄ on sulfonation yields exclusively 3-chloro-1,2-dimethylbenzenesulfonic acid-6 [Beil. XI-121] (corresp. sulfonyl chloride as yet unreported; corresp. sulfonamide, m.p. 199° (2)).

[C̄ with Cl_2 in pres. of Fe yields (1) 3,4-dichloro-1,2-dimethylbenzene, b.p. 234°, m.p. 8–9° (2).]

[*See also γ-chlorocrotonic acid* (3:2170).]

Although C̄ is capable of existing in two geometrically isomeric forms, only this one is known; collateral evidence (but not actual proof) indicates that C̄ is the *trans* stereoisomer.

[For prepn. of C̄ from ethyl vinylacetate [Beil. II-407] (5) with Cl_2 in CCl_4 (forming ethyl β,γ-dichloro-*n*-butyrate) followed by treatment with alc. NaOEt at 0° (splitting out HCl) and giving 65% yield see (5); from ethyl γ-chloro-β-hydroxy-*n*-butyrate [Beil. III-310, III_1-(116)] by dehydration with P_2O_5 (yields: 65% (4), 62.5% (3), 60% (2)) (6) (accompanied by some γ-chlorocrotonic acid (3:2170) (3) (2) and also by ethyl γ-chlorovinylacetate (3)) see indic. refs.]

C̄ on hydrolysis with $Ba(OH)_2$ below 0° or even (but less advantageously) with KOH gives (60% yield (3) (5)) (7) (2) γ-chlorocrotonic acid (3:2170), m.p. 83°; note, however, that hydrolysis with hot conc. alk. gives also two other products, viz., $O(CH_2{-}CH{=}CH.COOH)_2$, m.p. 195° (2), and γ-hydroxycrotonic acid, m.p. 108° (2).

[C̄ *in EtOH/NaOEt* undergoes *addition* of EtOH to unsatd. linkage followed to small extent by elimination of HCl with consequent ring closure to a cyclopropane deriv.; e.g., C̄ (0.134 mole) in 2½ pts. EtOH treated dropwise in cold with soln. of Na (0.087 mole) in the same vol. of EtOH as above gives (yields 42% (8), 25% (9)) ethyl γ-chloro-β-ethoxy-*n*-butyrate, b.p. 108.0–108.5° at 20 mm., $D_4^{17.5} = 1.078$, $n_D^{17.5} = 1.4295$ (8), accompanied by a little (3% yield (8)) ethyl 2-ethoxycyclopropane-1-carboxylate (1-carbethoxy-2-ethoxycyclopropane), b.p. 77.50–77.75° at 13 mm., $D_4^{13} = 0.995$, $n_D^{13} = 1.453$ (8); the latter is also obtd. (22% yield (8)) by distn. of the ethyl γ-chloro-β-ethoxy-*n*-butyrate with dry powdered KOH at 180° and 45 mm. press.]

[C̄ on dropwise addition to dry powdered KOH at 180° gives ethyl cyclopropane-1-carboxylate [Beil. IX-4, IX_1-(3)], b.p. 130° at 728 mm., $D = 0.970$, $n_D^{15} = 1.416$.]

[C̄ with excess dry powdered $CaBr_2$ heated several days under reflux gives (2) (10) ethyl γ-bromocrotonate. — C̄ (1 mole) with NaI (1 mole) in acetone reacts readily at ord. temp. pptg. NaCl (80% theory) and yielding (3) ethyl γ-iodocrotonate, b.p. 92–93° at 2 mm.]

[C̄ with NaOAc in AcOH heated at 100° cf. (11) yields (8) ethyl γ-acetoxycrotonate, b.p. 115–116° at 15 mm., $D_4^{23} = 1.075$, $n_D^{23} = 1.4445$ (11).]

[C̄ with conc. aq. NH_4OH not only has its halogen replaced by $-NH_2$ but also is hydrolyzed with consequent formn. of γ-aminocrotonic acid; this was not isolatable as such but only as its picrate, the m.p. of which, however, is not reported (2).]

[C̄ with Me_3N (excess) in alc. contg. a trace of NaI in s.t. at 100° followed by evapn. with HCl gives (4) γ-dimethylaminocrotonic acid chloromethylate (γ-dimethylaminocrotonbetain chloride), m.p. 203–205° dec. (4).]

$\bar{C}$ even on stdg. tends to lose HCl with formn. of styrene and styrene polymers (9); such decompn. is facilitated by pres. of any HCl and $\bar{C}$ could not be dried with P_2O_5 (10).

[Both opt. act. stereoisomerides of $\bar{C}$ are known but cannot be discussed here.]

[For prepn. of $\bar{C}$ from methyl-phenyl-carbinol (1:6475) with 6 *N* HCl (75% yield (3)) (7), with aq. HCl in pres. of $CaCl_2$ (2) (8), with HCl + $ZnCl_2$ (71% yield (11)), with $SOCl_2$ (82–88% yield (11)) (4) (5) (10), or with acetyl chloride (3:7065) (12) see indic. refs.; from ethylbenzene (1:7410) with Cl_2 in light (1) (13) (14) (15) or in pres. of 1% PCl_5 (90% yield (16)) see indic. refs.; from styrene (1:7435) by addn. of HCl (9) (17) (18) under press. in solvent (100% yield (19)) or at −80° (68% yield (29)) see indic. refs.; for formn. of $\bar{C}$ from methyl-phenyl-carbinyl MgBr during reaction with cyanogen chloride (47% $\bar{C}$ + 10% methyl-phenyl-carbinyl cyanide + 5% 2,3-diphenylbutane) see (6); for formn. of $\bar{C}$ from methyl phenyl ketone (acetophenone) (1:5515) during reduction with Zn/Hg + HCl see (20).]

[$\bar{C}$ passed at elevated temp. over dehydrohalogenating cat. (21), or htd. with pyridine in s.t. 6 hrs. at 130° (77% yield (22)), or boiled with a small excess quinoline for ½ hr. (75–80% yield (16)) (23), or its quat. salt with pyridine htd. in vac. (24), or htd. with acids less volatile than HCl (25), or htd. with salts of org. bases (26) (23) yields styrene (1:7435), b.p. 145°.]

[$\bar{C}$ with H_2 and Pd in pres. of MgO as specified (8) gives rapidly and quant. ethylbenzene (1:7410); note that $\bar{C}$ reduces much more readily than the isomeric β-chloroethylbenzene (3:8712) (8).]

$\bar{C}$ on hydrolysis, e.g., by boilg. with 25% excess of 10–15% aq. Na_2CO_3 soln., gives (90% yield (16)) (27) methyl-phenyl-carbinol (1:6475) q.v.; $\bar{C}$ with aq. alc. or with aq. alc. NaOH gives at 50° only (5) methyl-phenyl-carbinol; at 100° both styrene (1:7435) and α,α-diphenyl-diethyl ether are also formed (5); under certain circumstances α-diphenyl-diethyl ether may also appear (5) (1). [For study of hydrolysis of $\bar{C}$ in acetone contg. $HgCl_2$ see (4).]

[$\bar{C}$ with aq. Na_2SO_3 on boilg. for 9 hrs. (14) (7) gives (43–45% yield (14)) sodium α-phenylethanesulfonate (corresp. sulfonyl chloride, ndls. from alc., m.p. 79° (14) cf. (7), corresp. sulfonamide and anilide are unreported).]

$\bar{C}$ on oxidn. with $Cu(NO_3)_2$ (13) or on boilg. with aq. or dil. alc. soln. of hexamethylenetetramine (28) gives (60% yield (13)) methyl phenyl ketone (acetophenone) (1:5515).

B.P. 195–197° at 750 mm. (1)	D_{20}^{20} = 1.0257	(2)	n_D^{25} = 1.514	(1)
81° at 15 mm. (2)	1.0022	(1)		
66–72° at 11 mm. (7)	1.0190	(7)	n_D^{20} = 1.5120	(2)
			1.5109	(7)

The first reference given in Beil. V-395 *is erroneous.*

[For prepn. of $\bar{C}$ from β-(*p*-chlorophenyl)propene (2) by cat. hydrogenation see (2); from chlorobenzene (3:7903) with isopropyl alc. (1:6135) + H_2SO_4 (72% yield) see (3) or with isopropyl alc. (1:6135) + BF_3 + P_2O_5 (63% yield) see (7); for formn. of $\bar{C}$ from isopropylbenzene (cumene) (1:7440) with Cl_2 (together with other prods.) (4) (5) or with SO_2Cl_2 + $AlCl_3$ (6) see indic. refs.]

$\bar{C}$ on oxidn. with HNO_3 (D = 1.2) yields (3) (4) *p*-chlorobenzoic acid (3:4940).

$\bar{C}$ with chlorosulfonic acid yields a sulfonyl chloride which with NH_3 yields a sulfonamide, probably 2-chloro-5-isopropylbenzenesulfonamide, m.p. 91° (2).

3:8705 (1) [illegible] 4929, *C.A.* **33**, 4587 (19[illegible] [illegible]eyer, Bernhauer, *Mon*[illegible] [illegible] 8, No. 4, 30 pp. (1934); *Cent.* **1934**, II 595; **1936**, I 540; *C.A.* **29**, 6885 (1935). 3:8710 *o*-XYLYL CHLORIDE C_8H_9Cl Beil. V - 364
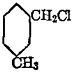
(*o*-Methylbenzyl chloride, V$_1$-(180)
ω-chloro-*o*-xylene) V$_2$-(283)

B.P. 197–199° (1)
92–94° at 20 mm. (2)
76–80° at 14 mm. (3)

3:8700 **m-XYLYL CHLORIDE** (*m*-Methylbenzyl chloride, ω-chloro-*m*-xylene) C_8H_9Cl Beil. V - 373, V_1-(183), V_2-(291)



B.P. 195–196° u.c. (2) D_{20}^{20} = **1.064** (2) n_D^{25} = **1.5327** (1)
85–88° at 16 mm. (6)

[For special study of prepn. (76% yield) by chlorination of *m*-xylene (1:7420) in light see (1).]

C̄ stood with $N/10$ alc. NaOEt at 30° yields ethyl *m*-xylyl ether [Beil. VI-494], b.p. 202°, to extent of 10.9% in 6 hrs., 32.4% in 24 hrs. (3) cf. (4). [For data on rate of hydrolysis with acid or alkali in acetone soln. at 30° see (5).]

C̄ with Mg in ether yields R.MgCl; on carbonation at 0° (7) this yields *m*-$CH_3.C_6H_4.CH_2$.-COOMgCl; this upon acidification presumably (no record) would yield *m*-tolylacetic acid [Beil. IX-528], m.p. 61°; upon treatment (8) with C_2H_5MgBr, however, it gives a mixt. contg. 57.6% *m*-tolylmalonic acid, colorless pdr. from $CHCl_3$, m.p. 130–131° with loss of CO_2 (8). [Use of isopropyl MgCl in place of C_2H_5MgBr gave 88% of *m*-tolylmalonic ac. (8).]

C̄ on boiling with $Pb(NO_3)_2$ soln. (2), or $Cu(NO_3)_2$ soln. (30% yield (6)), or alk. Na_2CrO_4 (90% yield (6)) gives *m*-tolualdehyde (1:0208).

Ⓓ *N*-(*o*-Xylyl)phthalimide [Beil. XXI-467]: ndls. from alc., m.p. 117–118°. [Reported (9) from *m*-xylyl bromide and therefore presumably obtainable under appropriate conditions from C̄.]

70.5° at 9 mm. (2)

Oil with odor like amyl acetate.

[For prepn. of C̄ from γ-chloro-*n*-valeric acid (3:9270) + EtOH + H_2SO_4 see (1); from γ-*n*-valerolactone (1:5080) with HCl in EtOH see (3).] [For the opt. active isomers of C̄ see Beil. II_2-(268) and subsequent literature.]

3:8703 (1) Schjanberg, *Ber.* **70**, 2385–2391 (1937). (2) Wohlgemuth, *Compt. rend.* **158**, 1578 (1914); *Ann. chim.* (9) **2**, 300–301 (1914). (3) Noyes, Cox, *J. Am. Chem. Soc.* **25**, 1094 (1903).

87% (10) (11), 74% (6)) or warming in dimethylaniline (91% yield (1)) (17) (for intermediate formn. of β-phenylethyl chlorosulfite see (18)) see indic. refs.]

[For formn. of C̄ from β-chloroethyl p-toluenesulfonate with C_6H_5MgBr (36% yield (19)) (20) see indic. refs.; from di-(β-chloroethyl) sulfate with C_6H_5MgBr (25% yield) see (21); from C_6H_5HgCl with ICl in CCl_4 (35% yield) see (11); from methyl β-phenylethyl ether (22) or N-(β-phenylethyl)benzamide (7) (15) or N,N-*bis*-(β-phenylethyl)benzamide (60% yield (23)) with PCl_5 see indic. refs.; from β-phenylethylamine hydrochloride with HNO_2 see (24); from *bis*-(β-phenylethyl) ether with AcCl + $ZnCl_2$ see (9); from boilg. ethylbenzene (1:7410) with Cl_2 (as by-product of the α-isomer) see (25) (26) (27) (35).]

C̄ on oxidn. with CrO_3/H_2SO_4 is much more resistant than benzyl chloride (3:8535) (28) but ultimately yields benzoic acid (1:0715), m.p. 121°. — [C̄ passed with steam and air at 450° over pumice impregnated with V_2O_5 gives (29) benzoic acid (52%), benzaldehyde (35%), phenylacetaldehyde (6%), and styrene (3%).]

[C̄ on reduction with H_2 + $Pd/CaCO_3$ in pres. of MgO ultimately gives ethylbenzene (1:7410) but rate is very much slower than with α-chloroethylbenzene (3:8667) (12).]

[For study of rate of reactn. of C̄ with aq. alc. NaOH (much slower than with α-chloroethylbenzene (3:8667) see (10); for rate with NaOEt see (30); for rate with NaOPr see (47); C̄ with KOC_6H_5 in alc. gives (45–50% yield (31)) phenyl β-phenylethyl ether [Beil. VI-479], b.p. 180° at 23 mm., D_4^{20} = 1.0501 (31); C̄ with NaOAc + AcOH yields (32) mainly β-phenylethyl acetate (1:3922), but 15% of the isomeric *methyl-phenyl-carbinyl* acetate [Beil. VI-476, VI₁-(236)], b.p. 222° (32), is also formed.]

[C̄ with NaI in acetone boiled 4 hrs. gives (33) β-phenylethyl iodide, b.p. 125–128° at 18–20 mm. (33) (for rate of reactn. of C̄ with KI in acetone see (13) (34)): C̄ with alc. KCN yields (25) (26) (27) β-phenylethyl cyanide [Beil. IX-512, IX₁-(199)] which on hydrolysis gives hy[illegible] acid (1:0615), m.p. 48–49°; C̄ on boilg. for 20 hrs. with conc. aq. Na_2SO_3 gives [illegible] chloride, m.p. 34° [illegible] m.p. 77° (35)) ac[illegible] evolution of SO_2 (contrary to previous report (36)).]

C̄ with Mg in dry ether yields (2) (11) (19) (5) (37) (38) $C_6H_5.CH_2.CH_2.MgCl$: this RMgCl cpd. with dry CO_2 yields (19) hydrocinnamic acid (1:0615), m.p. 48–49°; with phenylisocyanate it yields (2) hydrocinnamanilide, m.p. 96°; with $HgCl_2$ it gives (85% yield (11)) β-phenylethyl HgCl, m.p. 163–166° (11). [For reactn. of this RMgCl cpd. with cyclopentanone (38), cyclohexanone (37), α-tetralone (37), and other ketones see indic. refs.]

[C̄ with $AlCl_3$ in CS_2 or lgr. gives (12) (1) a resin; *C̄ with $AlCl_3$ + C_6H_6 gives (85% yield* (39)) (40) dibenzyl (1:7149) together with other products (26) (27).] — [C̄ with Na in C_6H_6 or ether (41) gives ethylbenzene (1:7410) and 1,4-diphenylbutane [Beil. V-616, V₁-(290)], m.p. 52°.] [For behavior of C̄ with benzhydryl sodium (42), triphenylmethyl sodium, etc. (6), see indic. refs.]

[C̄ on mononitration, e g., with HNO_3 (D = 1.52) at −15° (3) (24) (4) (44) (45) or even at −70° (45) gives (70% yield (44)) β-(4-nitrophenyl)ethyl chloride, m.p. 49° (3) (44), 48–49° (4), 48° (45) (43), 46–47° (24), accompanied by (30% yield (44)) β-(2-nitrophenyl)-ethyl chloride, an oil, b.p. 156.5–158° at 15 mm., D_{-}^{20} = 1.5620, n_D^{20} = 1.562 (46); some β-(2,4-dinitrophenyl)ethyl chloride, m.p. 136° (4), is sometimes formed (4).]

3:8712 (1) Sisido, Kato, *J. Soc. Chem. Ind. Japan* **43**, Suppl. bind., 450–451 (1940); *C.A.* **35**,

[illegible]

Lachrymatory oil.

[For prepn. (88% yield) from *o*-tolylcarbinol (1:5922) by action of thionyl chloride and pyridine see (2), by action of H_2SO_4 + HCl (85–92% yield) see (3); the prepn. from *o*-xylene (1:7430) by action of trioxymethylene + HCl gives a mixture of C̄ and *p*-xylyl chloride (3:8660) (4) (5) (6).]

C̄ stood with $N/10$ alc. NaOEt at 30° yields ethyl *o*-xylyl ether [Beil. VI-484], oil, b.p. 208–210°, to extent of 21% in 6 hrs., 52% in 24 hrs. (7) cf. (8). [For data on rate of hydrolysis with acid or alkali in acetone soln. at 30° see (9).]

C̄ with Mg in ether yields R.MgCl; on carbonation at 0° (10) this yields *o*-$CH_3.C_6H_4.CH_2$.COOMgCl; this upon acidification presumably (no record) would yield *o*-tolylacetic acid [Beil. IX-527], m.p. 88–89°; upon treatment (11) with C_2H_5MgBr, however, it gives 83.3% yield of *o*-tolylmalonic ac., ndls. from aq., m.p. 139–140°, with loss of CO_2 (11), + 16% yield of *o*-tolylacetic ac.

C̄ refluxed 5 hrs. with dil. alc. KCN gives 74% yield (2) *o*-tolylacetonitrile [Beil. IX-527], b.p. 244°, which on boiling 1 hr. with dil. H_2SO_4 (2) gives 73% yield (2) of *o*-tolylacetic ac. [Beil. IX-527], ndls. from aq., m.p. 88–89°.

C̄ on warming at 100° with 1.3 moles pyridine gives ppt. of *o*-xylylpyridinium chloride, cryst. from CH_3OH + dry ether, m.p. 183° (12).

Ⓓ *N*-(*o*-Xylyl)phthalimide [Beil. XXI-467]: cryst. from alc., m.p. 148–149°. [Reported (13) from *o*-xylyl *bromide* and therefore presumably obtainable under appropriate conditions from C̄.]

$D_4^{15.6} = 1.1024$ (2)
$n_D^{15.5} = 1.56226$ (2)

Colorless liq. with arom. odor soon changing to that of formaldehyde and benzoyl chloride from air oxidation (5). — $\bar{C}$ could not be polymerized even in u.v. light, by peroxides or $SnCl_4$ (12).

[For prepn. of $\bar{C}$ from methyl phenyl ketone (acetophenone) (1:5515) with PCl_5 see (2) (1) (5) (6), from α,α-dichloroethylbenzene ("acetophenone dichloride") on htg. see (7); from β-bromo-α-chloroethylbenzene (styrene chloro-bromide) with alc. KOH in the cold (70% yield) see (4); from α,β-dichloroethyl benzene (styrene dichloride) (3:6685) with aq. alc. NaOH at 50–60° (89% yield) see (13).]

$\bar{C}$ on boilg. with conc. HCl (4) (1), or $\bar{C}$ with 80% H_2SO_4 at 60° for 4 hrs. (13) cf. (14), gives (81% yield (13)) cf. (14) acetophenone (1:5515).

$\bar{C}$ is resistant to actn. of alc. KOH (5); $\bar{C}$ on refluxing for 13 hrs. with very conc. alc. NaOEt gives (8) some phenylacetylene (1:7425) together with other prods. (8).

[$\bar{C}$ with NOCl yields (9) α,β,β-trichlorostyrene, b.p. 148–150° at 20 mm. (9); $\bar{C}$ htd. with alc. KCN in s.t. at 200–220° yields (10) phenylsuccinonitrile which on saponification gives phenylsuccinic acid (1:0790); $\bar{C}$ with Na in liq. NH_3 gives (15% yield (10)) ethylbenzene (1:7410); $\bar{C}$ with $NaNH_2$ in liq. NH_3 gives (57% yield (11)) phenylacetylene (1:7425); $\bar{C}$ in alc. contg. BF_3/EtOAc (12) or in pres. of HCl (1) condenses with itself by loss of 3 HCl yielding 1,3,5-triphenylbenzene (1:7270).]

$\bar{C}$ (10 g.) in C_6H_6 (10 ml.) stood 3 days with PCl_5 (30 g.) in C_6H_6 (50 ml.), then poured into aq. worked up as directed (13), yields 1-phenyl-1-chloroethylenephosphinic acid-2, $C_6H_5—C(Cl)=CH—P(=O)(OH)_2$, ndls. from dil. HCl, m.p. 162° (13) (together with a little benzoic acid (1:0715), m.p. 121°).

Liquid with odor of hyacinth; used in perfume industry. Although $\bar{C}$ should exist in two geom. stereoisomeric forms only this one has as yet been recognized. — Volatile with steam.

[For prepn. of $\bar{C}$ from cinnamic acid (1:0735) with Cl_2/aq. or HOCl (1) (3) (10) (8) (12), with Cl_2 in EtOH (11), with NaOCl (13) (20), or $Ca(OCl)_2$ (14) see indic. refs.; from α,β-dichlorohydrocinnamic acid (cinnamic acid dichloride) [Beil. IX-514, IX₁-(200)] with Na_2CO_3 at 100° (yield: 97% (15) (1)) (9) (6) or with NaOAc (60% yield (5)) see indic. refs.; from α-chloro-β-hydroxyhydrocinnamic acid [Beil. X-250, X₁-(110)] by htg. with aq. in s.t. at 200–220° see (2) cf. (3): for formn. of $\bar{C}$ from ω,ω-dichloroethylbenzene [Beil. V-354] with alc. KOH in s.t. at 120° see (4); from phenyl-trichloromethyl-carbinol [Beil. VI-476, VI₁-(237)] with Zn dust in alc. see (16); from α,β-dichloroethylbenzene (styrene dichloride) (3:6685) by htg. with pyridine (17) or by passing over Al_2O_3 at 360–400° and 85–105 mm. (92% yield (20)) see indic. refs.; from C_6H_5MgBr with acetylene tetrachloride (3:5750) see (18): from styrene chlorohydrin (3:9570) by dehydration over HPO_3 on silica gel at 370–400° and 95–115 mm. (63% yield) see (20).]

[$\bar{C}$ with Cl_2 in $CHCl_3$ yields (1) α,β,β-trichloroethylbenzene [Beil. V-355], b.p. 254.5–255.5° sl. dec. at 770 mm., b.p. 137° at 21 mm., D_4^{15} = 1.3619, n_D^{15} = 1.5652 (1); $\bar{C}$ with

Br_2 in $CHCl_3$ yields (1) (13) (19) β-chloro-α,β-dibromoethylbenzene [Beil. V-356], ndls. from alc., m.p. 32° (1) (13), b.p. 165° sl. dec. at 26 mm. (1).

C̄ with alc. KOH in s.t. at 200–250° is partly resinified (2); C̄ with very conc. alc. KOH gives on very strong htg. a chlorine-free oil which on distn. with aq. gives phenylacetaldehyde (1:0200) (4). [For rate of loss of halogen with alc. KOH see (5).] — C̄ with EtOH/NaOEt in s.t. at 175–182° for 5½ hrs. gives (66% yield (20)) β-ethoxystyrene [Beil. VI-564, VI_1-(279)] for conversion of which to phenylacetaldehyde see (20).]

C̄ on oxidn. with $K_2Cr_2O_7$ + H_2SO_4 or with HNO_3 (D = 1.2) gives (2) benzoic acid (1:0715).

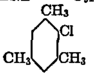
3:8725 2-CHLORO-1,3,5-TRIMETHYLBENZENE $C_9H_{11}Cl$ **Beil. V - 408**
(*eso*-Chloromesitylene) V_1—
V_2-(315)



B.P. 204–206° (1) $D^{30}_{-} = 1.0337$ (2) $n^{30}_D = 1.52119$ (2)
103.6–103.7° at 25 mm. (2)
90–91° at 20 mm. (3)

C̄ remains liquid down to −20°. C̄ is insol. aq., eas. sol. alc. or ether; volatile with steam but less so than dichloromesitylene.

[For prepn. of C̄ from 1,3,5-trimethylbenzene (mesitylene) (1:7455) with Cl_2 either directly (1) or in $CHCl_3$ at 0° (75% yield (3)) accompanied by 2,4-dichloro-1,3,5-trimethylbenzene (1) and/or 2,4,6-trichloro-1,3,5-trimethylbenzene, m.p. 209° (3), 204–205° (1)), or from 2,4,6-trimethylphenol (mesitol) (1:1467) with PCl_5 in C_6H_6 (2) see indic. refs.]

C̄ with fumg. H_2SO_4 (20% SO_3) shaken for 15 min. gives 2-chloromesitylenesulfonic acid

(corresp. sulfonyl chloride, oil (3), sulfonamide, m.p. 165.5–166° (3)) but gives no evidence of any Jacobsen rearrangement (3).

C̄ with fumg. HNO_3 yields (1) (4) mainly 4,6-dinitro-2-chloromesitylene, colorless ndls. from alc., m.p. 178–179° (1), 176.5° (4) [the mononitration prod., 4-nitro-2-chloromesitylene, has m.p. 56–57° (1)].

C̄ on oxidn. with boilg. dil. HNO_3 (1 conc. HNO_3: 2 aq.) for 30 hrs. yields (1) 4-chloro-3,5-dimethylbenzoic acid ("chloromesitylenic acid") [Beil. IX-536], browns at 220° but does not melt (unsuitable as derivative). [Note that a little 4-nitro-2-chloromesitylene m.p. 56–57° (1), may be formed in this process; furthermore that attempts to oxidize C̄ with $K_2Cr_2O_7$ + dil. H_2SO_4 yield only acetic acid (1).]

C̄ on oxidn. with aq. $KMnO_4$ gives (63.5% yield (5)) 2-chlorobenzenetricarboxylic acid-1,3,5 (chlorotrimesic acid) (3:4975), readily sol. cold aq., excessively sol. hot aq., m.p. anhydrous acid 285° (5), monohydrate 278° (6).

3:8737 1-CHLORO-3-PHENYLPROPENE-1 C_9H_9Cl Beil. V —
(ω-Chloroallylbenzene; V_1—
γ-chloroallylbenzene) V_2-(373)

B.P. 212–214° cor. (1) $D_4^{14} = 1.073$ (1) $n_D^{14} = 1.545$ (1)
97° at 18 mm. (1)
76° at 13 mm. (2)

Liquid with penetrating odor suggesting benzene.

[For prepn. of C̄ from 1,3-dichloropropene-1 (3:5280) with $C_6H_6 + AlCl_3$ (3), or with C_6H_5MgBr in toluene (1) (4) or ether (2) (alm. quant. yield (1)), see indic. refs.]

C̄ with PCl_5 gives on warming (by addition to C̄ of 2 atoms chlorine) alm. quant. yield (5) of 3-phenyl-1,1,2-trichloropropane, b.p. 135–136° at 13 mm., $D_4^{23} = 1.293$, $n_D^{23} = 1.553$ (5).

C̄ with Br_2 adds similarly giving (1) (4) 1-chloro-1,2-dibromo-3-phenylpropane, b.p. 160° at 12 mm., $D_4^{10} = 1.727$, $n_D^{10} = 1.611$ (4) (for use of this prod. in prepn. of hydrocinnamaldehyde (1:0225) see (6)).

[C̄ resists hydrolysis and is unchanged even after several hours with aq. + PbO in s.t. at 200° (1) (4); however, C̄ with KOH (3 moles) in abs. alc. on refluxing at 130–135° is readily converted (by reactn. of the ω-chlorine atom and rearr. or vice versa) into cinnamyl ethyl ether (γ-ethoxyallylbenzene) [Beil. VI-571, VI_1-(281)], b.p. 127–128° at 22 mm., $D_4^{15} = 0.970$, $n_D^{15} = 1.547$ (1) (4), which by cleavage with HCl under press. gives (7) cinnamyl chloride (3:0010) q v.]

[C̄ with Na (4 moles) in boilg. toluene gives (8) propenylbenzene (β-methylstyrene) [Beil. V-481, V_1-(371)], b.p. 176°, neither methyl phenylacetylene nor benzylacetylene being formed.]

[C̄ with $NaNH_2$ in high-boilg. pet. at 105–110° gives (75% yield (9)) (10) (11) benzylacetylene [Beil. V_2-(408)], b.p. abt. 166° at 760 mm. (with resinification).]

89–93°	at 6 mm. (6)		

[For prepn. of C̄ from γ-phenyl-*n*-propyl alc. (hydrocinnamyl alc.) (1:6520) with fumg. HCl in s.t. at 130° (1) (15) or 140–150° (3), or in s.t. at 100° for 8 hrs. (77% yield (5)), or with $ZnCl_2$ + conc. HCl (40% yield (8)) (2) see indic. refs.; with $SOCl_2$ in ether (82% yield (9)) or pyridine (48.5% yield (10)) or dimethylaniline (70.5% yield (10)) see indic. refs. (for intermediate formn. of γ-phenyl-*n*-propyl chlorosulfite and *bis*-(γ-phenyl-*n*-propyl) sulfite in this reactn. see (11)); from γ-chloro-*n*-propyl *p*-toluenesulfonate (2 moles) with C_6H_5MgBr in ether (yield: 62% (6), 31% (12)) see indic. refs.; from $C_6H_5CH_2MgCl$ with di-(β-chloroethyl) sulfate in ether (66% yield) see (4); from *o*-(γ-chloro-*n*-propyl)-aniline via diazotization and treatment with alk. + $SnCl_2$ (75% yield (3)) (13) see indic. refs.; from *N*-methyl-*n*-(γ-phenyl-*n*-propyl)benzamide with PCl_5 see (14).]

C̄ is not decomposed on boilg. with $ZnCl_2$ and does not react at 100° with AgOAc (1).

[C̄ boiled for 8 hrs. with excess 5% NaOMe in MeOH gives (86% yield (15)) γ-phenyl-*n*-propyl methyl ether [Beil. VI_1-(252)], b.p. 206.5° at 758.5 mm. u.c., b.p. 100–102° at 20 mm. (15); C̄ with KOH in EtOH refluxed 2 hrs. gives (1) γ-phenyl-*n*-propyl ethyl ether [Beil. VI-503], b.p. 224° cor.; C̄ boiled several hours with excess conc. alc. $NaOC_6H_5$ gives (100% yield (3)) γ-phenyl-*n*-propyl phenyl ether [Beil. VI-504, VI_1-252], b.p. 182–183° at 17 mm. (3).]

[C̄ on boilg. several hours with alc. NaI yields (3) γ-phenyl-*n*-propyl iodide, b.p. 137–140° at 20 mm. (3) (for rate of reactn. of C̄ with KI in acetone at 50° see (5)).]

[C̄ with activated Mg in dry ether gives (98% yield (9)) $C_6H_5.CH_2\ CH_2.CH_2.MgCl$; for reactn. of this RMgCl cpd. with various carbonyl cpds., e.g., acrolein (10), ethyl phenyl ketone (9), or cyclopentanone (16), see indic. refs.]

[C̄ with $AlCl_3$ in CS_2 or lgr. gives (17) about 10% hydrindene (1:7511), b.p. 177°, together with other products.]

[C̄ on mononitration with 4 vols. HNO_3 ($D = 1.5$) below −10° gives over 90% yield (18) of γ-(*p*-nitrophenyl)-*n*-propyl chloride [Beil. V_1-191], b.p. 176–180° at 15 mm. with sl. dec. (18).]

178°	**at 15 mm.**	**(1)**
166–171° at	**10 mm.**	**(2)**
128–130° at	**2 mm.**	**(3)**

M.P. +11° (1) (4)

[*See also 6-chloro-2-phenylphenol* (3:1757).]

Important Note: Through the year 1944 (and perhaps in some cases beyond) the chlorophenyl-phenol of m.p. + 11° ($\bar{C}$) was regarded as having the structure 6-chloro-2-phenylphenol = 3-chloro-2-hydroxybiphenyl. In 1945, however, this view was corrected by the paper of Weissberger and Salminen (3); in this text, therefore, expression of the facts is reported in the light of their paper. Particular care is, therefore, required in consulting references prior to it since such material is universally expressed in the reverse sense of the present view.

[For prepn. of $\bar{C}$ from 2-hydroxybiphenyl (1:1440) with Cl_2 (note that 6-chloro-2-phenylphenol (3:1757) is also formed) see (1) (4) (3), for prepn. of $\bar{C}$ from 5-amino-2-hydroxybiphenyl (5) by diazotization and use of Cu_2Cl_2 reaction (27% yield (3)) see indic. refs.]

$\bar{C}$ is sol. in aq. 25% NaOH at 60° but on cooling seps. $Na\bar{A}.4H_2O$, m.p. 84–85° (1); anhydrous $Na\bar{A}$, m.p. 280° (1) (4) (for use in sepn. of $\bar{C}$ from the isomeric 6-chloro-2-phenylphenol (3:1757) see (1)). [For formn. of $Na\bar{A}$ in org. solvents such as MeOH, ether, or toluene see (8).]

The calcium salt of $\bar{C}$ is more sol. in aq. than the corresp. deriv. of the isomeric 6-chloro-2-phenylphenol (3:1757) (use in sepn. (2)).

$\bar{C}$ on mononitration with HNO_3 in AcOH at 15–20° as directed gives (48% yield (3)) 5-chloro-2-hydroxy-3-nitrobiphenyl, yellow ndls., m.p. 57–58° (3).

[$\bar{C}$ on condensation with formaldehyde + morpholine yields (6) a prod. m.p. 125–126° (6).]

—— **4-Chloro-2-phenylphenyl benzoate:** m.p. 86–87° (7). [Note that this prod. does *not* distinguish $\bar{C}$ from the isomeric 6-chloro-2-phenylphenol (3:1757) whose benzoate has m.p. 88.5°.]

CHAPTER XX

DIVISION C. LIQUIDS WITH BOILING POINTS REPORTED ONLY UNDER REDUCED PRESSURE

3:9000–3:9299 (C_3–C_6 inclusive)

(Arranged in sequence of empirical formulas)

3:9030 MALONYL DICHLORIDE $O{=}\underset{\displaystyle Cl}{\underset{|}{C}}{-}CH_2{-}\underset{\displaystyle Cl}{\underset{|}{C}}{=}O$ $C_3H_2O_2Cl_2$ Beil. II - 582
II_1-(252)
II_2-(529)

B.P. 58°	at 27 mm. (1) (2) (3)	$D_4^{22.9} = 1.4505$ (4)	$n_D^{23.4} = 1.45973$ (4)
58°	at 26 mm. (4)		
53.6°	at 22 mm. (5)	$D_4^{20} = 1.4509$ (5)	
53–54°	at 19 mm. (4)	1.450 (4)	$n_D^{20} = 1.4639$ (5)
55°	at 15 mm. (6)		
47°	at 15 mm. (7)	$D_4^{18.6} = 1.4486$ (4)	$n_D^{18.4} = 1.46205$ (4)
47°	at 13 mm. (4)		

Colorless liq. turning dark red on stdg. (6).

[For prepn. of $\bar{C}$ from malonic acid (1:0480) with $SOCl_2$ (yield 70% (8), 60% (6), 50% (9)) (1) (2) or with PCl_5 (yield: 68% (3), 36% (7)) see indic. refs.; for formn. of $\bar{C}$ from carbon suboxide with dry HCl gas see (10); for mfg. of $\bar{C}$ from methylene dichloride (3:5020) with CO, COS, or $COCl_2$ (3:5000) + cat. at 700° see (11).]

[$\bar{C}$ in ether or EtOAc with Ag_2O, PbO, ZnO, etc., yields (8) carbon suboxide, b.p. +7°; $\bar{C}$ treated at 0° with dry HBr gas yields (12) malonyl dibromide, b.p. 55–57° at 11 mm. (12); $\bar{C}$ on cat. hydrogenation as specified (13) yields a condensation prod., m.p. 83°, of formylglutaconic acid.]

[$\bar{C}$ with acetone + $CaCO_3$ yields (14) mainly $CH_3.CO.CH_2.CO.CH_2.CO.Cl$ [Beil. III_1-(263)] + a little phloroglucinol (1:1620) (the acid chloride itself, however, is quant. conv. to phloroglucinol by further htg. with $CaCO_3$).]

[$\bar{C}$ with $AlCl_3$ + C_6H_6 yields (1) dibenzoylmethane (1:1480), m.p. 78°; for reactn. of $\bar{C}$ with $AlCl_3$ + naphthalene (1:7200) yielding (15) (16) *peri*-naphthindandione (1,8-malonylnaphthalene) [Beil. VII_1-(391)] see indic. refs.; for reactn. of $\bar{C}$ with acenaphthene (1:7225) yielding (15) (17) *peri*-acenaphtheneindandione (5,6-malonylacenaphthene) which on oxidn. gives (17) (18) naphthalene-1,4,5,8-tetracarboxylic acid [Beil. IX-1002, [illegible] .V-272], [illegible] l is no longer evolved gives (85% yield (19)) malonyl-diurethane, cryst. from alc., m.p. 124° (19).

$\bar{C}$ on hydrolysis with aq. yields malonic acid (1:0480). [Note that the half acid chloride of malonic acid has m.p. 65° dec. (20).] — For the amide, anilide, p-toluidide, and other derivs. corresp. to $\bar{C}$ see malonic acid (1:0480).

3:9031 α-CHLOROACROLEIN (2-Chloropropen-2-al-1) $CH_2{=}C(Cl){-}CHO$ C_3H_3OCl Beil. I — I_1— I_2-(785)

B.P. 40° at 30 mm. (1)	$D^{20}_{-} = 1.199$ **(2) (3)**	$n^{20}_{D} = 1.463$ **(2) (3)**
39–40° at 30 mm. (2)	$D^{15}_{-} = 1.205$ **(3)**	
29–31° at 17 mm. (3)	$D^{0}_{-} = 1.272$ **(3)**	

Colorless strongly lachrymatory liq. with pronounced irritating effect on mucous membranes.

[For prepn. of $\bar{C}$ from acrolein (1:0115) in aq. with Cl_2 (50% yield (2)) or from α,β-dichloropropionaldehyde (3:9034) by loss of 1 HCl with hot aq. NaOAc (27% yield (3)) (1) see indic. refs.]

$\bar{C}$ readily polymerizes.

[$\bar{C}$ in CCl_4 with Cl_2 in cold adds 1 mole halogen giving (2) α,α,β-trichloropropionaldehyde (3:9033).]

[$\bar{C}$ in dry ether with Br_2 in cold adds 1 mole halogen giving (2) α-chloro-α,β-dibromopropionaldehyde, b.p. 105° at 55 mm., $D^{20}_{-} = 2.17$, $n^{20}_{D} = 1.548$.]

[For conversion of $\bar{C}$ with EtOH to α-chloroacrolein diethylacetal, b.p. 158–160°, see (4).]

3:9031 (1) Muskat, Becker, *J. Am. Chem. Soc* **52**, 816–817 (1930). (2) Berlande, *Bull. soc. chim.* (4) **37**, 1392–1393 (1925). 3:9032 *d,l*-α,β-DICHLOROPROPIONYL CHLORIDE $C_3H_3OCl_3$ Beil. S.N. 162

$CH_2Cl{-}CHCl{-}C({=}O)Cl$

B.P. 52–54° at 16 mm. (1)	$D^{20}_{4} = 1.4757$ **(2)**	$n^{20}_{D} = 1.47640$ **(2)**
43–44° at 10 mm. (2)		

[For prepn. of $\bar{C}$ from α,β-dichloropropionic acid (3:0855) with $SOCl_2$ see (1) (2); for formn. of $\bar{C}$ from glyceric acid (α,β-dihydroxypropionic acid) with PCl_5 see (4) (3) (5).]

[$\bar{C}$ with alcohols yields alkyl α,β-dichloropropionates; e g., cf. (1) (2) (3).]

$\bar{C}$ on hydrolysis yields α,β-dichloropropionic acid (3:0855) q.v.

3:9032 (1) Marvel, Dec, Cooke, Cowan, *J. Am. Chem. Soc.* **62**, 3495–3498 (1940). (2) Leimu, *Ber.* **70**, 1046, 1050 (1937). (3) Werigo, Werner, *Ann.* **170**, 163–167 (1874). (4) Werigo, Okulitch, *Ann.* **167**, 49 (1873). (5) Wichelhaus, *Ann.* **135**, 253 (1865); **143**, 3 (1867).

[$\bar{C}$ with hexanone-2 directly has not been studied, but $\bar{C}$ with *n*-butylacetylene (1:8055) in pres. of $Et_2O.BF_3$/HgO/MeOH/trichloroacetic acid gives (104) 4-(chloromethyl)-2-*n*-butyl-2-methyl-1,3-dioxolane, b.p. 109° at 25 mm.]

[$\bar{C}$ with acetophenone (1:5515) in pres. of H_2SO_4 or HCl gives (105) a prod. presumably 4-(chloromethyl)-2-methyl-2-phenyl-1,3-dioxolane, b.p. 153–153.3° at 40 mm., which with 2 *N* HCl at 60° is hydrolyzed into its original components.]

Behavior of $\bar{C}$ with Salts of Organic Acids

$\bar{C}$ reacts with salts of organic acids to give in general the corresp. glycerol α-esters.

With salts of aliphatic monobasic acids. [$\bar{C}$ with Na formate on htg is claimed to yield (106) (45) glycerol α-monoformate [Beil. II-24, II_1-(19), II_2-(33)], but owing to the instability of this prod. the reliability of its supposed constants has been questioned (8)]

[$\bar{C}$ with NaOAc or KOAc in s.t. at 150–160° yields (107) glyceryl α-acetate [Beil. II-146, II_1-(69), II_2-(159)], b.p. 129–131° at 3 mm., D_4^{20} = 1,2060, n_D^{20} = 1.4517 (108), but the reactn. is accompanied by some formn of glyceryl diacetate and glyceryl triacetate.]

[For corresp. reactions of $\bar{C}$ with sodium salts of *n*-butyric acid (1:1035), isobutyric acid (1:1030), *n*-valeric acid (1:1060), isovaleric acid (1:1050), and *n*-caproic acid (1:1130) see (8).]

[$\bar{C}$ with K laurate in s.t. at 180° under CO_2 (109) or $\bar{C}$ with Na laurate at 130° (110) gives glyceryl α-laurate ("α-monolaurin") [Beil. II-362, II_1-(157), II_2-(320)], m.p. 63° (111), cf. (112), 62° (2).]

[$\bar{C}$ with K myristate in s.t. at 180° under CO_2 (109), or $\bar{C}$ with sodium myristate at 110–115° for 8–10 hrs. (110), gives (70% yield (110)) glyceryl α-myristate ("α-monomyristin") [Beil. II-366, II_1-(162), II_2-(327)], m.p. 68° (109) (113), 67.3° (111) cf. (112).]

[$\bar{C}$ with K palmitate in s.t. at 180° under CO_2 (109), or $\bar{C}$ with Pb palmitate at 112° under CO_2 (113), gives (50% yield (113)) glyceryl α-palmitate ("α-monopalmitin") [Beil. II-373, II_2-(338)], m.p. 74–75° (2), 77° (111) cf. (112).]

[$\bar{C}$ with K stearate in s.t. at 180° under CO_2 (109), or $\bar{C}$ with sodium stearate at 110–115° for 8–10 hrs. (110) cf. (114), gives glyceryl α-stearate ("α-monostearin"), m.p. 81.1° (111) cf. (112).]

With salts of amino acids. [For analogous formn. of corresp. glyceryl mono esters from $\bar{C}$ with sodium salts of aminoacetic acid (glycine) (115), α-aminopropionic acid (alanine) (115), α-amino-isocaproic acid (leucine) (116) see indic. refs]

With alkali cyanides. [$\bar{C}$ in 95% alc. with aq. KCN (or NaCN) in s.t. at 100° for 36 hrs., followed by hydrolysis, gives (9) 28% yield of the lactone of β,γ-dihydroxy-*n*-butyric acid (β-hydroxy-*n*-butyro-γ-lactone), m.p. 22.5–26° (9), accompanied by (23% yield (9)) the lactone of γ-hydroxyisocrotonic acid, m.p. +5° (9) (presumably formed by loss of H_2O from the former).] Cf. behavior of "glycerol β-monochlorohydrin" (3:9039).

Behavior of $\bar{C}$ with Other Non-Nitrogenous Organic Reactants

With alkyl halides (or their equivalents). [$\bar{C}$ with MeI + silver oxide (15), or $\bar{C}$ with methyl *p*-toluenesulfonate at 150° for 5 hrs. (117), or $\bar{C}$ with diazomethane (118) gives the corresp. dimethyl ether, viz., 3-chloro-1,2-dimethoxypropane, b.p. 156–157° at 760 mm. (117), 156–158° (118), 156° (15), D_4^{25} = 1.08 (15), n_D^{25} = 1.43 (15).]

[Note that the corresp. diethyl ether, viz., 3-chloro-1,2-diethoxypropane, b.p. 69.8–70.4° at 14 mm., D_4^{19} = 1.026, n_D^{20} = 1.4246, has been prepd. indirectly (119).]

With RMgX cpds. [$\bar{C}$ with EtMgBr (2 moles) reacts in an obscure fashion yielding [illegible] 5455). — $\bar{C}$ with *iso*-AmMgBr (4 moles) (perhaps acting [illegible] es (25% yield (120)) 2,5-dimethylhexanediol-1,2 [Beil. [illegible], 129–132° at 11 mm.]

[C̄ with C_6H_5MgBr (4 moles) (perhaps acting through intermediate acetol) gives (120) (121) (60% yield (120)) 2-phenylpropanediol-1,2 [Beil. VI-930] accompanied by some 3-phenylpropanediol-1,2 [Beil. VI-929].]

Behavior of C̄ with Amines

With primary amines. *With aliphatic primary amines.* [C̄ with *n*-heptadecylamine (122) or its hydrochloride gives a prod. which may be the expected *N*-(β,γ-dihydroxy-*n*-propyl)*n*-heptadecylamine.]

With aromatic primary amines. [C̄ with aniline (2 moles) + a little aq. refluxed for 1 hr., then neutralized, gives (63% yield (124)) *N*-(β,γ-dihydroxy-*n*-propyl)aniline [Beil. XII-183], b p. 249–250° at 50 mm. (125), 200–203° (124), m p. 42° (124), 52° (125).]

[C̄ with *p*-aminophenol gives (126) *N*-(β,γ-dihydroxy-*n*-propyl)-*p*-aminophenol, m.p. 192°, used as photographic developer (127); for analogous reactions of C̄ with *p*-anisidine giving *N*-(β,γ-dihydroxy-*n*-propyl)-*p*-anisidine, m p. 75–76° see (126), or of C̄ with *p*-phenetidine giving *N*-(β,γ-dihydroxy-*n*-propyl)-*p*-phenetidine, m p 93° (126), 90–92° (128), see indic refs.]

With secondary amines. *With aliphatic secondary amines* [C̄ with Me_2NH + aq. NaOH at 20–40° (129) or C̄ with Me_2NH in s.t. at 100° for 5–6 hrs. (130) (131) cf. (132) gives 3-(dimethylamino)propanediol-1,2 [Beil. IV-302], b.p. 220° cor. at 749 mm. (130), 111° at 15 mm. (132) — C̄ with Et_2NH in s t. at 100° for 5–6 hrs. (131) cf. (130) (132) gives 3-(diethylamino)propanediol-1,2 [Beil. IV-302], b p. 233–235° at 748 mm (130) (131), 106° at 3 mm. (132) (corresp. *bis*-(*N*-phenylcarbamate), m p. 106 5° (133); corresp. *bis*-(*N*-phenylcarbamate)monohydrochloride, m.p. 109° (133)).]

With heterocyclic secondary amines [C̄ with piperidine in s t. at 100° for 4–5 hrs. (131, cf. (132) or in ord flask at 100° for 1½ hrs. (134) gives 3-(piperidino)propanediol-1,2 [Beil XX-34, XX_1-(12)], m p 83° (135) (132), 79–80° (136), 67–68° (134) (corresp. *bis*-(*p*-nitrobenzoate), m.p. 108° (135); corresp. *bis*-(*N*-phenylcarbamate)monohydrochloride ("Diothane"), m.p. 201–202° cor. (137), 197–198° u.c (?) (133)). — Note that in prepn. of "Diothane" the influence of the purity of the piperidine has been studied (137); that 3-(piperidino)propanediol-1,2 yields a *mono*-(*N*-phenylcarbamate)monohydrochloride, m.p. 176–177° (133); for resolution of *d,l*-3-(piperidino)propanediol-1,2 into its opt. act. enantiomorphs and prepn. of the corresp opt act. "Diothanes" see (138)]

With tertiary amines. [C̄ with Me_3N anhydrous (139) or in aq soln in s.t. at 100° for 8 hrs. (31) or in alc. soln. in s.t. at 100° for 6 hrs. (140) gives trimethyl-(β,γ-dihydroxy-*n*-propyl)-ammonium chloride [Beil. IV-302]. — C̄ with Et_3N in s.t. at 100° for 8 hrs. gives (141) triethyl-(β,γ-dihydroxy-*n*-propyl)-ammonium chloride [Beil. IV-303]. — For analogous behavior of C̄ with tri-*n*-propylamine, quinoline, and strychnine see (141). — For quat. salt from C̄ with *N,N*-dimethyl "stenyl" amine see (142).]

Behavior of C̄ with Other Nitrogenous Org. Reactants

[C̄ with diazomethane gives (118) the corresp. dimethyl ether for which see above under behavior of C̄ with alkyl halides.]

[C̄ with aq. Na_2NCN stood for 12 hrs., then shaken with benzoyl chloride, gives (143) the tribenzoate, m.p. 130° of 5-(hydroxymethyl)-2-aminooxazoline; substitution of benzenesulfonyl chloride for the benzoyl chloride yields (144) corresp. *tris*-(benzenesulfonate), m.p. 158°.] Cf. behavior of epichlorohydrin (3:5358).

—— **Glycerol α-monochlorohydrin α′-acetate (γ-chloro-β-hydroxy-*n*-propyl acetate):** b.p. 240° (see 3:6775).

—— Glycerol α-monochlorohydrin β-acetate (β-chloro-β'-hydroxy-isopropyl acetate): b.p. 218° (see 3:6517).

—— Glycerol α-monochlorohydrin α,β-diacetate: b.p. 245° (see 3:6840).

—— Glycerol α-monochlorohydrin α'-benzoate: unreported.

—— Glycerol α-monochlorohydrin β-benzoate: unreported.

—— Glycerol α-monochlorohydrin α',β-dibenzoate: unreported.

Ⓓ Glycerol α-monochlorohydrin di-(*p*-nitrobenzoate): m.p. 108–109° u.c. (14), 108° (15), 107–108° (2). [From $\bar{C}$ with *p*-nitrobenzoyl chloride (2 moles) in pyridine at room temp. for several days (93–96% yield (14)) or in $CHCl_3$ soln. with quinoline as acid acceptor (100% yield (2)); note that this prod. depresses m.p. (121–122°) of the corresp. deriv. of the isomeric glycerol β-monochlorohydrin (3:9039) (14).]

—— Glycerol α-monochlorohydrin α'-(?)-(*N*-phenylcarbamate): m.p. 128–129° (16), 127–129° (9), 126° (42). [From $\bar{C}$ with phenyl isocyanate in 7% yield (9); note that for the corresp. deriv. of glycerol β-monochlorohydrin (3:9039) the m.p. is 133–136°.]

Ⓓ *N*-(β,γ-dihydroxy-*n*-propyl)phthalimide: m.p. 111.5–112.5° (145), 111° (46). [From $\bar{C}$ with K phthalimide (100% yield (46)), but no details of conditions are stated.]

[For prepn. of $\bar{C}$ from 1,1,1-trichloropropanone-2 (3:5620) by reduction with fused $Al(OEt)_3$ in abs. alc. under H_2 or N_2 (8) or with $AlEt_3$ etherate in ether (3) (yields: 67% (8), 65% (3)) see indic. refs.; for prepn. of $\bar{C}$ from chloral (3:5210) with CH_3MgBr (9) (19) (2) cf. (4) or MeMgI (2) cf. (4) (yield: 40% (9) (2)) see indic refs. (note that by this method the normal *addn* of RMgX leading to $\bar{C}$ is accompanied by *reduction* leading to 2,2,2-trichloroethanol (3:5775) and the relative proportion of these two reactions is profoundly influenced by the pres. of metal salts (9)); for prepn of $\bar{C}$ from chloral (3:5210) with $ZnMe_2$ see (6).]

$\bar{C}$ is used as hypnotic pharmaceutical under the trade name "Isopral" (10), for use as seed disinfectant see (11); for study of disinfectant power and toxicity see (12); for comparative study of narcotic action see (13) — For study of tests for $\bar{C}$ see (7) (14).

$\bar{C}$ on reduction in aq. AcOH + Zn dust in cold yields (15) 1,1-dichloropropene-1 (3:5120).

$\bar{C}$ on oxidn. with fumg. HNO_3 under reflux for 5 hrs. gives (2) trichloroacetic acid (3:1150); use of $K_2CR_2O_7$ + H_2SO_4 gives only insignificant yields (2) while less strong HNO_3 even after 4 hrs. at 100° has only slight action (2).

$\bar{C}$ with P_2O_5 on htg loses H_2O giving (84% yield (19)) (2) 1,1,1-trichloropropene-2 (3:5345), b.p. 114–115° at 757 mm. (2).

[$\bar{C}$ with HNO_3/H_2SO_4 mixt. yields (2) β,β,β-trichloroisopropyl nitrate, oil, $D^{13}_{-} = 1.499$, $n_D^{-} = 1.47892$, but decompg. on htg — $\bar{C}$ with PCl_3 or PCl_5 yields (2) (1) various partial ester/acid chloride derivs. of phosphorous or phosphoric acids — $\bar{C}$ with $SOCl_2$ evolves HCl + SO_2 and also yields (2) a liq presumably β,β,β-trichloroisopropyl chlorosulfonate.]

$\bar{C}$ with aq or alc. NaOH or conc. aq Na_2CO_3 gives on htg. (16) (17) mainly acetaldehyde (1.0100) and lactic acid (1:0400), also accompanied by formic acid (1:1005) and carbon monoxide; for use of this reactn. in detection of $\bar{C}$ see (14) — $\bar{C}$ with EtOH/NaOEt on htg. gives (15) ethyl α-ethoxypropionate [Beil. III-280, III_1-(109), III_2-(206)], b p. 155° cor. at 760 mm, $D_4^{20} = 0.9446$, $n_D^{20} = 1.40125$.

[$\bar{C}$ with AcCl yields (2) β,β,β-trichloroisopropyl acetate, b.p. 180–181° cor. 766 mm., m p. + 8°, $D^{13}_{13} = 1.353$, $n_D^{-} = 1.46017$ (2).]

—— β,β,β-Trichloroisopropyl carbamate: cryst. from C_6H_6, m.p. 125° (18). Prepd. indirectly from β,β,β-trichloroisopropoxy MgBr with phosgene in toluene, followed by treatment with NH_3 (35% yield (18)).]

			1.3375 (3)

Attention is directed to the fact that C̄ is in most respects extremely similar in physical constants and chemical behavior to the isomeric glycerol α-monochlorohydrin (3-chloropropanediol-1,2) (3:9038); that C̄ is very readily partially isomerized to the latter, and that, therefore, the homogeneity of all prepns. of C̄ or reactn. prods. derived from supposedly pure C̄ must be accepted with reserve. The literature of the two glycerol monochlorohydrins is seriously entangled, and reference to the original articles must be made for supporting details.

PREPARATION OF C̄

C̄ has been isolated (3) from the mixed glycerol monochlorohydrins by fractional hydrolysis and distillation; this isolation has been confirmed (4) (6) by methods based on the slower condensation of C̄ with acetone (see below). — The mixture of glycerol monochlorohydrins obtd. from glycerol (1:6540) with conc. HCl at 120° for 5 hrs. under press. contains (4) 13% C̄.

3:9040 1,4-DICHLOROBUTADI-YNE-1,3 C_4Cl_2 Beil. I — I_1— I_2-(246)
(Dichlorobiacetylene) Cl—C≡C—C≡C—Cl

M.P. 1-3° (1)

Long colorless ndls., which can be distilled under N_2 yielding a colorless oil (1). — $\bar{C}$ has odor of dichloroacetylene; readily polymerizes to an insol. dark brown explosive material. — $\bar{C}$ explodes at 73° (1).

[For prepn. of $\bar{C}$ from diacetylene [Beil. I-266] by actn. of alk. hypochlorite soln. in cold and absence of light see (1) (2) (3).]

$\bar{C}$ dislvd. in $CHCl_3$ and stood 1 day with I_2 in $CHCl_3$ adds 2 moles I_2 yielding (1) 1,4-dichloro-1,2,3,4-tetraiodobutadiene-1,3, which after careful recrystn. from C_6H_6/pet. ether has m.p. 155-157° (1).

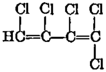
3:9044 1,1,2,3,4-PENTACHLOROBUTADIENE-1,3 C_4HCl_5 Beil. I - 250 I_1— I_2-(225)

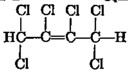


B.P. 125° at 70-80 mm. (1)

[From 2,3,4,5,5-pentachloropentadien-2,4-oic acid-1 [Beil. II-482] by boilg. with aq., then distilling with steam; the structure of the acid (and therefore of $\bar{C}$) is disputed (2). — For two other materials (b.p. 193-200° at 720 mm.) having the composition C_4HCl_5, obtd. from trichloroethylene (3:5170) with $AlCl_3$, but thought *not* to be identical with $\bar{C}$, see (3).]

3:9044 (1) Zincke, Kuster, *Ber.* **26**, 2113 (1893). (2) Zincke, *Ann.* **296**, 143 (1897). (3) Kaufler, *Ann.* **433**, 48-51 (1923).

3:9046 1,1,2,3,4,4-HEXACHLOROBUTENE-2 $C_4H_2Cl_6$ Beil. S.N. 11
(Liquid stereoisomer)



B.P. 97-98° at 10 mm. (1) D_{15}^{15} = **1.651 (1)** n_D^{-} = **1.53313 (1)**

[*See also solid stereoisomer* (3:1945).]

Colorless oily liq. with agreeable odor.

[For formn. of $\bar{C}$ (together with its solid stereoisomer (3:1945)) by actn. of Cl_2 upon the high-boilg. fraction obtd. in the prepn. of trichloroethylene (3:5170) from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) see (1); for formn. of $\bar{C}$ from the liq. stereoisomer (3:6150) of 1,2,3,4-tetrachlorobutadiene-1,3 + Cl_2 see (1).]

3:9046 (1) Müller, Hüther, *Ber.* **64**, 589-600 (1931); *C.A.* **25**, 3956-3957 (1931).

[For formn. of $\bar{C}$ (together with the isomeric α-monochlorohydrin) from a mixt. of monochlorohydrin diacetates with abs. MeOH contg. dry HCl gas see (7).]

[The mixture of the two glycerol monochlorohydrins obtd. from allyl alcohol (1:6145) by addn. of HOCl (1) (8) (5) cf. (6) (9) (10) (11) (13) or from epichlorohydrin (3:5358) q.v. by addn. of aq. in pres. of acids has been shown (12) to be essentially similar to that obtd. from glycerol with HCl, although different proportions of α- and β- isomers might be anticipated (3).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Reduction of $\bar{C}$. [$\bar{C}$ with Na/Hg in aq. alc. HCl gives (8) trimethylene glycol (1:6490).]

Behavior with aq. alkalies. [$\bar{C}$ with aq. alk. loses HCl and ring-closes to 3-hydroxy-1,2-epoxypropane (glycidol = epihydrin alcohol): this reactn. occurs with $\bar{C}$ very much more slowly than for the isomeric α-monochlorohydrin (3:9038); for its use in detn. of purity of $\bar{C}$ see (6) (3) (13) (14).]

Behavior with alkali cyanides. [$\bar{C}$ in 95% alc. with aq. KCN (or NaCN) in s.t. at 100° for 36 hrs., followed by hydrolysis, does *not* (6) give the expected β,β'-dihydroxyisobutyric acid but instead gives (35% yield (6)) the lactone of β,γ-dihydroxy-*n*-butyric acid (β-hydroxy-*n*-butyro-γ-lactone), m.p. 22.5–26° (6), i.e., the same prod. similarly obtd. from glycerol α-monochlorohydrin (3:9038).]

Behavior with NaI. [$\bar{C}$ with dry NaI in anhydrous acetone in s.t. at 100° for 12 hrs. gives (18% yield (15)) glycerol β-mono-iodohydrin, m.p. 52–53° (15).]

Behavior with acetone. [$\bar{C}$ in acetone with P_2O_5 at 2–7° gives (57% yield (4)) a condensation prod., "acetone-β-chlorohydrin," $C_6H_{11}O_2Cl$, b.p. 161.5–162 2° cor. at 757 mm., $D_4^{15} = 1.1344$, $n_D^{15} = 1.4487$, this condensation occurs less readily, however, than the analogous reactn. for glycerol α-monochlorohydrin (3:9038), and removal of the latter by this means has been used (4) to enrich the proportion of $\bar{C}$ in a mixt. of the two]

—— **Glycerol β-monochlorohydrin α-acetate:** oil, b.p. 230° at 760 mm., 230–234° cor. at 750 mm. (10), $D_{15}^{15} = 1\ 235$ (10). (See 3:6648.)

—— **Glycerol β-monochlorohydrin α,α'-diacetate:** oil, b.p. 101–102° at 4 mm. (15).

—— **Glycerol β-monochlorohydrin α-benzoate:** unreported.

—— **Glycerol β-monochlorohydrin α,α'-dibenzoate:** oil, b.p. 210–211° at 1.5 mm. (15).

—— **Glycerol β-monochlorohydrin α,α'-*bis*-(*p*-nitrobenzoate):** m p. 121–122° (16) (7). [Prepd. indirectly; note that this prod. depresses the m.p. of authentic glycerol α-monochlorohydrin *bis*-(p-nitrobenzoate), m.p. 108–109° u.c. (7).]

—— **Glycerol β-monochlorohydrin α-(*N*-phenylcarbamate):** m.p. 133–136° (6), 131–133° remelting at 133° (12). [From $\bar{C}$ with phenyl isocyanate in 6% yield (6); note that, for the corresp. deriv. of glycerol α-monochlorohydrin, m.p. is 128–129° (12).]

07 (1943).
Chem. **92**,
ss, *J. Am.*

$\bar{C}$ is volatile with steam (use in sepn. from accompanying resin (1).)

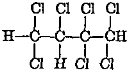
$\bar{C}$ reduces Tollens' soln. but not $NH_4OH/AgNO_3$ without alkali (1).

$\bar{C}$ is not attacked by boilg. 0.1% $KMnO_4$ (1).

$\bar{C}$ on boilg. with excess $N/10$ alc. KOH splits off 2.34–2.6 moles HCl but $\bar{C}$ cannot be titrated (1).

3:9054 (1) Prins, *Rec. trav. chim.* **56**, 123–124 (1937).

3:9056 1,1,2,2,3,4,4-HEPTACHLOROBUTANE $C_4H_3Cl_7$ Beil. S.N. 10



B.P. 137.5° at 13.5 mm. (1) D^{20}_{20} = **1.742 (1)** n^{20}_D = **1.5407 (1)**

97.5° at 2 mm. (1)

[For prepn. of $\bar{C}$ (60% yield (1) together with other products) from 1,2-dichloroethylene (3:5030) + pentachloroethane (3:5880) + $AlCl_3$ for 12 days at 40° see (1).]

$\bar{C}$ in CCl_4 gives with $AlCl_3$ a yel. color; no HCl is evolved on boilg., and on addn. of water the solution is completely decolorized (1).

$\bar{C}$ with Zn dust in alc. gives (50% yield (1)) of a trichlorobutadiene, b.p. 161°, 52° at 12 mm. (1).

3:9056 (1) Prins, Rec. trav. chim. ***56****, 124–125 (1937).*

3:9057 1,2-DICHLOROBUTADIENE-1,3 $C_4H_4Cl_2$ Beil. S.N. 12

B.P. 60–65° at 105 mm. (4) D^{15}_{15} = **1.207 (1)** n^{15}_D = **1.5078 (1) (5)**

46.75–47.5° at 85 mm. (5)

60–65° at 40 mm. (1) D^{15}_4 = **1.199 (5)** n^7_D = **1.4698 (2)**

$\bar{C}$ polymerizes slower than chloroprene (3:7080) yielding a rubberlike polymer which on vulcanization gives an ebonite-like subst. (1).

[For prepn. of $\bar{C}$ (56% yield (4)) from 1-chloro-2-vinylacetylene (3:7070) by treatment as directed at room temp. with conc. HCl + CuCl + NH_4Cl see (4); for formn. from vinylacetylene + Cl_2 see (3); for prepn. of $\bar{C}$ from 1,2,4-trichlorobutene-2 (3:9062) with EtOH/KOH see (5).]

$\bar{C}$ on oxidn. with $KMnO_4$ yields (3) oxalic acid dihydrate (1:0445). — $\bar{C}$ on ozonization in CCl_4 (3) yields oxalic acid (1:0535) and formic acid (1:1005); under specified conditions, however, *α,β*-dichloroacrylic acid (3:2265), m.p. 85–86°, has been isolated (3).

$\bar{C}$ fails to add maleic anhydride (3). — [For behavior of $\bar{C}$ with HOBr or with HgO + I_2 + MeOH see (6).]

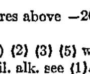
3:9098-A METHYL (CHLOROFORMYL)ACETATE $C_4H_5O_3Cl$ Beil. II - 582

(Carbomethoxyacetyl chloride) II₁-(252) II₂—



B.P. 57–59° at 12 mm. (1)

[*See also ethyl (chloroformyl)acetate* (3:9246).]

Note that C̄ is both an acid chloride and an ester; it comprises the half acid chloride/half methyl ester of malonic acid (1:0480).

[For prepn. of C̄ from potassium salt of methyl hydrogen malonate with $SOCl_2$ in dry ether (68% yield) see (1).]

C̄ on htg. or on repeated distn. or by action of quinoline in dry ether at 0° loses HCl and undergoes condensation to methyl 6-methoxy-2,4-diketo-2,3-dihydropyran-3-carboxylate [Beil. XVIII₁-(540)], ndls. from $CHCl_3$, m.p. 148–150° (1) cf. (2).

· Ⓓ ω-(Carbomethoxyacet)anilide: ndls. from ether/pet. eth., m.p. 42–43° (1). [From C̄ with aniline (1).]

—— ω-(Carbomethoxyacet)-*p*-toluidide: unreported.

3:9098-A (1) Staudinger, Becker, *Ber.* **50**, 1019–1020 (1917). (2) Leuchs, *Ber.* **39**, 2643 (1906).

3:9099 β-HYDROXYETHYL TRICHLOROACETATE (A) $HOCH_2CH_2—O—CO.CCl_3$ $C_4H_5O_3Cl_3$ Beil. S.N. 160, 2691

(2-Hydroxy-2-(trichloromethyl)-1,3-dioxolane)

 (B)

B.P. 130–140° at 12 mm. (1)			n_D^{25} = 1.4762 (3)
89° at 1.75 mm. (2)			
83° at 0.8 mm. (2)		D_4^{20} = 1.532	n_D^{20} = 1.48378 (2)
68° at 0.025 mm. (3)			1.4775 (3)

Note that C̄ may react either in the ester form (A) or the dioxolane form (B) and doubtless exists as a tautomeric equilibrium of both; in this equilibrium, however, form (A) probably predominates (2), but variations in the equilibrium may account for the observed variation in n_D^{20} (see above).

Colorless odorless oil, spar. sol. aq. (2). — C̄ on long stdg. is claimed (2) to disproportionate to ethylene glycol *bis*-(trichloroacetate) (not, however, otherwise described in the literature) and ethylene glycol (1 6465). — C̄ on attempted distn at usual water-pump vac. (14–17 mm.) (3) or C̄ in presence of a trace of pyridine (3) decomposes yielding monomeric ethylene glycol carbonate [Beil. XIX-100], m.p 38°, and $CHCl_3$ (3:5050).

[For prepn. of C̄ from ethylene glycol (1:6465) with trichloroacetyl chloride (3:5420) in 1,4-dioxane soln. (82% yield (2)) or from ethylene oxide (1:6105) with trichloroacetic acid (3:1150) (28% yield based on latter (1) (3)) see indic. refs.]

C̄ on shaking with aq. and simultaneously titrating with $N/10$ aq. NaOH hydrolyzes to ethylene glycol (1:6465) and trichloroacetic acid (3:1150) as shown by Sap Eq. of 207.8 (2) (calcd. 207.5).

[C̄ with diazomethane (1) best in CCl_4 soln. (2) gives (yields: 78% (2), 39% (1)) the methyl ether corresp. to structure (B), viz., 2-methoxy-2-(trichloromethyl)-1,3-dioxolane, pr. tbls. from alc., m.p. 78–78.5° (1), 77–78° (2) (4), b.p. 114–115° at 12 mm. (4), 112–113° at 10 mm. (1); this product although resistant to saponification by alkalies is hydrolyzed by dil. acids (4). — Note that the isomeric methyl ether corresponding to structure (A), viz., β-methoxyethyl trichloroacetate, although not obtainable from C̄, has nevertheless been prepd. (82% yield (4)) from β-methoxyethanol (methyl "cellosolve") (1:6405 with trichloroacetyl chloride (3:5420), has quite different physical props., viz., m.p. 14 6–14 8° (4), b.p. 92–93° at 10 mm. (4), and is easily hydrolyzed (4) on shaking with aq. alone to β-methoxyethanol (1:6405) and trichloroacetic acid (3:1150). — Note also that the first of the above two methyl ethers, i e , 2-methoxy-2-(trichloromethyl)-1,3-dioxolane, by *trans*-esterification with alcohols (e g., EtOH (2), *n*-PrOH (4), *n*-BuOH (2)) can be converted to its higher homologs.]

C̄ with acid chlorides gives esters corresp. to the acylic structure (A): e.g., C̄ with AcCl (3:7065) gives (71% yield (4)) the mixed ester, ethylene glycol acetate-trichloroacetate (β-acetoxyethyl trichloroacetate) b.p. 122° at 11 mm. (4); C̄ with $SOCl_2$ gives (70% yield (4)) β-chloroethyl trichloroacetate (3:6510).

3:9099 (1) Meerwein, Hinz, *Ann* **484**, 16–17 (1930). (2) Meerwin, Sönke, *J. prakt. Chem.* (2) **137**, 295–298, 308–311 (1933). (3) Hibbert, Grieg, *Can. J. Research* **4**, 261–263 (1931). (4) Meerwin, Sönke, *Ber.* **64**, 2375–2381 (1931).

3:9100 *d,l*-β-CHLORO-*n*-BUTYRYL CHLORIDE $C_4H_6OCl_2$ Beil. II - 278

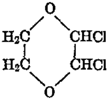
3:9105 2,3-DICHLORODIOXANE $C_4H_6O_2Cl_2$ Beil. S.N. 2668



B.P.	100–101°	at 24–25 mm.	(1)	M.P.	30°	(2)
	97–98°	at 20 mm.	(2)		28–30°	(4) (9)
	88–89°	at 16–17 mm.	(3)			
	85°	at 15 mm.	(4)			
	82°	at 14 mm.	(5)			

$\bar{C}$ is theoretically capable of existing in *cis* and *trans* forms; collateral evidence exists that both may actually be present, but they have not yet been isolated as such.

Although comml. $\bar{C}$ is liq. extremely pure samples may, after inoculation (9), be obtd. in cryst. form.

[For prepn. of $\bar{C}$ from 1,4-dioxane (1:6400) by actn. of Cl_2 at 90° in presence of catalyst such as $SnCl_2$ or I_2 (96 6% yield (6)), or with Cl_2 at 90° for 16 hrs. without catalyst (61% yield (4)), see (6) (4) (7).]

[For studies of further chlorination of $\bar{C}$ see (3) (8); for studies of reaction of $\bar{C}$ with alcohols and phenols see (5) (9) (2) (10) (11) (17); for studies of reaction of $\bar{C}$ with R.MgX cpds. see (12) (13) (4) (14) (15); for reaction of $\bar{C}$ with Mg + I_2 yielding dioxadiene see (16).]

$\bar{C}$ on boiling with aq. for 10 min. gives clear soln. containing hydrolysis products, viz., ethylene glycol (1:6465) and glyoxal. After cooling, making alk., and shaking with BzCl the former can be converted to ethylene glycol dibenzoate (1:2293), extracted with ether, recrystd. from MeOH, m.p. 73° (70–72° (3)); another portion of the aq. soln. of hydrolysis products gives on treatment with *p*-nitrophenylhydrazine hydrochloride a 97% yield of glyoxal-*p*-nitrophenylosazone, yel. cryst., m.p. 306° (310°) (3).

[*See also chloral* (3:5210) *and chloral hydrate* (3:1270).]

PREPARATION

From chloral. [For prepn. of C̃ from chloral (3:5210) with EtOH (1:6130) (yields: 100% (11), 71.3% with 95% EtOH refluxed 2 hrs (4) (9) (12)) see indic. refs.; for influence of solvents see (13) (14); for formn of C̃ from chloral (3:5210) + *AcH* + *Al*(OEt)$_3$ see (8).]

From chloral hydrate. [For prepn. of C̃ from chloral hydrate (3:1270) with EtOH (1:6130) (yield: 75% in 60 min., 38% in 24 hrs. reflux (4)), with triethyl orthoformate (1:3241) (25% yield in 105 min. reflux (4)), or *with tetraethyl orthosilicate* (4% *yield in* 4 hrs. reflux (4)) see indic. refs.]

From ethyl alcohol. [For formn. of C̃ as end prod. of reaction of ethyl alcohol (1:6130) *with* Cl_2 *see* (15).]

PHYSICAL PROPERTIES

C̃ is less sol. in aq. than chloral hydrate (3:1270) (6) (7). — [For study of toxicity of C̃ as compared with chloral hydrate (3:1270) see (29).]

CHEMICAL BEHAVIOR

Dissociation. C̃ on distillation (7) or in some solns. in org. *solvents cf.* (17) (2) (18) is partially dissociated into chloral (3:5210) and EtOH (1:6130).

Behavior with Inorganic Reactants

With H_2SO_4. C̃ with cold conc. H_2SO_4 yields (1) chloral (3:5210) (or its polymerization products) and $EtHSO_4$.

With aq. alkali. C̃ with aq alkali gives (6) $CHCl_3$ (3:5050) + salts of formic acid (1:1005).

With chlorine. [C̃ with Cl_2 at 80° gives (19) trichloroacetaldehyde diethylacetal (3:6317).]

With PCl_5. [C̃ with PCl_5 in ether below 20° (20) (4) cf. (21) (22) gives (yields: 55–74% (20), 25–33% (11)) α,β,β,β-tetrachloroethyl ethyl ether [Beil. I-623, I_2-(681)], b.p. 189.7° at 758.7 mm. (21), 189.4° at 749.1 mm. cor. (20), 184° at 738 mm. (4), 79° at 16 mm. (20); D_4^{13} = 1.4225 (20).]

Behavior with Organic Reactants

With other alcohols. [C̃ with other alcohols may undergo an exchange of alkyl radicals; for studies of such interchange see (4) (2).]

[For prepn. of C̄ from either the low-boilg. (3:5360) or high-boilg. (3:5615) stereoisomers of 1,2-dichlorobutene-2 (together with 2-chlorobutene-2-ol-1 (3:8240)) by hydrolysis with 2 pts. aq + 1 mole $CaCO_3$ for 4 hrs. at 70° see (1); note that C̄ is formed by virtue of allylic transposition during the process and that *Cent.* and *C.A.* do not agree on the boilg. pt. [For prepn. of $\bar{C}$ from 2-(chloromethyl)1,2,3-trichlorobutane (3:5230) by loss of HCl with boilg. alc. KOH (1-chloro-2-(chloromethyl)butadiene-1,3 (3:9195) is also formed) see (2); for formn. of $\bar{C}$ from 3-chloro-2-(chloromethyl)butene-1 (3:9206) with Cl_2 + $NaHCO_3$ at 0° (yield 6% $\bar{C}$ together with 90% 2-(chloromethyl)-1,2,3-trichlorobutane (3:5230)) see (1).]

$\bar{C}$ on ozonolysis yields (2) 1,3-dichlorobutanone-2 (3:5900) and formic acid (1:1005).

3:9201 (1) Tishchenko, *J. Gen. Chem. (U.S.S.R.)* **8**, 1232–1246 (1938); *Cent.* **1939**, II 4223; *C.A.* **33**, 4190 (1939). (2) Tishchenko. *J. Gen. Chem. (U.S.S.R.)* **6**, 1116–1132 (1936); *Cent.* **1937**, I 573; *C.A.* **31**, 1003 (1937)

3:9202 2,5-DICHLOROPENTENE-2 $C_5H_8Cl_2$ Beil. S.N. 11

B.P. 40–41° at 8 mm. (1) $D_4^{14.5}$ = **1.1182** (1) $n_C^{14.5}$ = **1.4683** (1)

[For prepn. of $\bar{C}$ (92% yield (1)) from cyclopropyl methyl ketone [Beil. VII-7, VII$_1$-(5)] with PCl_5 below 20° see (1); for formn. of $\bar{C}$ from 5-chloropentanone-2 (see below) with excess 50% KOH see (1).]

$\bar{C}$ with conc. H_2SO_4 gives (43% yield (1)) 5-chloropentanone-2 (3:9267).

$\bar{C}$ cannot be hydrolyzed with aq. + $CaCO_3$ but on protracted reflux (210 hrs.) with excess KOAc in abs. alc. gives 2-chloro-5-acetoxypentene-2, b.p. 81.5° at 13 mm., D_4^{15} = 1.0800, n_C^{15} = 1.4499 (1).

$\bar{C}$ on oxidn. with 3% $KMnO_4$ gives (1) acetic acid (1:1010) and acrylic acid (1:1020).

$\bar{C}$ on ozonolysis yields (1) β-chloropropionic acid (3:0460).

3:9202 (1) D'yakonov, *J. Gen. Chem. (U.S.S.R.)* **10**, 414–412 (1940); *C.A.* **34**, 7861 (1940).

With alc. NaOEt. [$\bar{C}$ with EtOH/NaOEt yields (23) $CHCl_3$ (3:5050) + ethyl formate (1:3000).]

With alc. KCN. [$\bar{C}$ with EtOH/KCN gives within 1 min. (88% yield (24)) ethyl dichloroacetate (3:5850): cf. behavior of chloral (3:5210) with KCN in various alcohols.]

With acid chlorides. [$\bar{C}$ with AcCl (3:7065) gives (25) the corresp. acetate [Beil. I-153], b.p. 198°. — $\bar{C}$ with isovaleryl chloride (3:7560) gives (41% yield (26)) the corresp. isovalerate, b.p. 143° at 20 mm. (26).]

With diazomethane. [$\bar{C}$ with CH_2N_2 in EtOH soln. at 0° gives (27) trichloroacetaldehyde ethyl-methyl-acetal [Beil. I-621, I_2-(681)], b.p. 193.4° cor. (28), 78–80° at 13 mm. (27) accompanied by 3,3,3-trichloro-1,2-epoxypropane (3:5760).]

- Ⓟ Behavior on heating. Note that $\bar{C}$ on htg. gives off inflammable vapor (EtOH) (dif. from chloral hydrate (3:1270) whose initial ignition cannot be maintained).
- Ⓟ Behavior with conc. HNO_3. $\bar{C}$ reacts violently on warming with conc. HNO_3 (dif.) from chloral hydrate (3:1270) which is almost unaffected).
- Ⓟ Iodoform test. $\bar{C}$ with aq. alk. + I_2/KI soln. on warming gives iodoform, m.p. 119° accompanied of course by $CHCl_3$ (3:5050) (dif. from chloral hydrate (3:1270)).

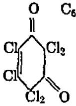
DIVISION C. LIQUIDS WITH BOILING POINTS REPORTED ONLY UNDER REDUCED PRESSURE

3:9300–3:9599 (C_6–C_8 inclusive)
(Arranged in sequence of empirical formulas)

—— **1,2,4,4,6,6-HEXACHLOROCYCLOHEXEN-1-DIONE-3,5** $C_6O_2Cl_6$ Beil. VII - 272
(" Hexachlororesorcinol ") VII$_1$—



B.P. 159–160° at 13–15 mm. **M.P. 115°**

See 3:3470. *Division A: Solids.*

3:9300 3,4-DICHLOROHEXATETRAENE-1,2,4,5 $C_6H_4Cl_2$ Beil. S.N. 14

B.P. 38–40° at 8 mm. (1) D_4^{20} = **1.1819 (1)** n_D^{20} = **1.5456 (1)**

[For prepn. of Č from 1,3,4,6-tetrachlorohexadiene-2,4 (3:9306) with 15% excess KOH in abs. MeOH at 10–15° (a much larger amt. of 1,3,4-trichlorohexatriene-2,4,5 (3:9302) is also formed) see (1).]

3:9300 (1) Coffman, Carothers, *J. Am. Chem. Soc.* **55**, 2040–2047 (1933).

3:9302 3,4,6-TRICHLOROHEXATRIENE-1,2,4 $C_6H_5Cl_3$ Beil. S.N. 13

B.P. 50° at 1 mm. (1) D_4^{20} = **1.3132 (1)** n_D^{20} = **1.5517 (1)**

[For prepn. of Č from 1,3,4,6-tetrachlorohexadiene-2,4 (3:9306) with 15% excess KOH in abs. MeOH at 10–15° (a small amt. of 3,4-dichlorohexatetraene-1,2,4,5 (3:9300) is also formed) see (1).]

3:9302 (1) Coffman, Carothers, *J. Am. Chem. Soc.* **55**, 2040–2047 (1933).

3:9304 3,6-DICHLOROHEXATRIENE-1,3,4 $C_6H_6Cl_2$ Beil. S.N. 13

B.P. 45–46° at 3 mm. (1) D_4^{20} = **1.1807 (1)** n_D^{20} = **1.5195 (1)**
38° at 1 mm. (1)

—— 5-Chloro-*n*-amyl acetate: b.p. 103° at 18 mm., $D_4^{20} = 1.0648$, $n_\alpha^{20} = 1.43791$ (1).
Ⓓ 5-Chloro-*n*-amyl *N*-phenylcarbamate: m.p. 72° (1).

3:9295 (1) Bennett, Heathcoat, *J Chem. Soc.* **1929**, 273–274. (2) Anderson, Pollard, *J. Am. Chem. Soc.* **61**, 3439–3440 (1939). (3) Bennett, Heathcoat, Mosses, *J. Chem Soc.* **1929**, 2569–2571. (4) Bennett, Turner, *J Chem. Soc.* **1938**, 814–815. (5) Magidson, Strukow, *Arch. Pharm.* **271**, 575 (1933) (6) von Braun, *Ber.* **49**, 974 (1916). (7) Clemo, Hook, *J. Chem. Soc.* **1936**, 608–609. (8) Anderson, Pollard, *J. Am. Chem. Soc.* **61**, 3440–3441 (1939).

[For prepn. of C̄ from 3,6-dichlorohexatriene-1,3,4 (3:9304) with conc. HCl contg. Cu_2Cl_2 by shaking for 12 hrs. at 27° see (1).]

C̄ refluxed with stirring for 7 hrs. with aq. Na_2CO_3 gives (1) chloride ion corresp. to three halogen atoms but the org. product was not identified.

C̄ on oxidn. with alk. $KMnO_4$ for 4 hrs. at 30–40° yields (1) chloroacetic acid (3:1370).

3:9308 (1) Coffman, Carothers, *J. Am. Chem. Soc.* **55**, 2040–2047 (1933).

3:9310 1,3-DICHLOROHEXADIENE-2,4 $C_6H_8Cl_2$ Beil. S.N. 12
(Divinylacetylene dihydrochloride)

$$CH_3{-}CH{=}CH{-}\underset{}{\overset{Cl}{\overset{|}{C}}}{=}CH{-}\overset{Cl}{\overset{|}{C}}H_2$$

B.P. 80–82° at 17 mm. (1) D_4^{20} = **1.1456 (1)** n_D^{20} = **1.5271 (1)**

[For prepn. of C̄ (53% yield (1)) from divinylacetylene by shaking with 12 *N* HCl contg. Cu_2Cl_2 see (1).]

C̄ refluxed with NaOAc + AcOH yields (by reactn. of *one* chlorine atom) 1-acetoxy-3-chlorohexadiene-2,4, b.p. 84–85° at 3 mm., D_4^{20} = 1.0915, n_D^{20} = 1.4890 (1). — Similarly C̄ on htg. with MeOH/KOH yields (1) 1-methoxy-3-chlorohexadiene-2,4, n.p. 88–92° at 30 mm., D_4^{20} = 1.0239, n_D^{20} = 1.4928 (1).

C̄ on oxidn. with aq. $KMnO_4$ in K_2CO_3 soln. gives (1) chloroacetic acid (3:1370) + acetic acid (1:1010).

C̄ with naphthoquinone-1,4 (1:9040) or with maleic anhydride (1:0625) gives (1) only a small amt. of dark gummy material.

3:9310 (1) Coffman, Nieuwland, Carothers, *J. Am. Chem. Soc.* **55**, 2048–2051 (1933).

3:9312 3-CHLOROHEXADIENE-1,3 C_6H_9Cl Beil. S.N. 12

$$CH_3.CH_2{-}CH{=}\overset{Cl}{\overset{|}{C}}{-}CH{=}CH_2$$

B.P. 68.2–69° at 117 mm. (1) D_4^{20} = **0.9390 (1)** n_D^{20} = **1.4770 (1)**

[For prepn. of C̄ from α-ethyl-β-vinylacetylene by shaking with conc. HCl contg Cu_2Cl_2 + NH_4Cl see (1).]

[For polymerization of C̄ see (1) (2).]

C̄ on htg. with 2 pts. naphthoquinone-1,4 (1:9040) for 2 hrs. at 100° then suspended in alc. NaOH and aerated gives (1) 2-chloro-1-ethylanthraquinone, yel. ndls. from alc., m.p. 151–152° (1).

[For study of another chlorohexadiene obtd. from allyl chloride (3:7035) by actn. of $NaNH_2$ in liq. NH_3 see (3).]

3:9312 (1) Jacobson, Carothers, *J. Am. Chem. Soc.* **55**, 1624–1627 (1933). (2) Carothers, Coffman (to du Pont), U.S. 1,950,441, March 13, 1934; *Cent.* **1934**, II 1037; *C.A.* **28**, 3270 (1934). (3) Kharasch, Nudenberg, Sternfeld, *J. Am. Chem. Soc.* **62**, 2034–2035 (1940).

3:9314 1-CHLORO-3-METHYLPENTADIENE-1,2 C_6H_9Cl Beil. S.N. 12

$$CH_3{-}CH_2{-}\overset{CH_3}{\overset{|}{C}}{=}C{=}\overset{Cl}{\overset{|}{C}}H$$

B.P. 68–70° at 100 mm. (1) D_4^{20} = **0.9562 (1)** n_α^{20} = **1.46967 (1)**

[For formn. of C̄ from 3-methylpentyn-1-ol-3 (ethyl-ethynyl-methyl-carbinol) by shaking

[For prepn. of C̄ from hexadien-2,5-yne-3 (divinylacetylene) (2) with Cl_2 in CCl_4 at −50° (20–25% yield together with other products) or in small yield with HOCl see (1).]

C̄ slowly polymerizes, changing in 3 months to a viscous sirup (1).

C̄ on cat. hydrogenation in EtOAc yields *n*-hexane (1:8530), b.p. 69–70° (1).

...0° gives (1) 1,3,4,6-tetrachlorohexadiene-2,4 n_D^{20} = 1.5458 (1).
12 hrs. at 27° adds HCl yielding (1) 3,3,6-trichlorohexadiene-1,4 (3:9308) q v.

C̄ refluxed with stirring for 8 hrs. with 6 pts. aq contg 2 moles Na_2CO_3 gives (1) chloride ion corresp. to one of the two initial halogenations together with a soft sticky resin. — C̄ with MeOH/KOH at 10–15° or with NaOMe in dry MeOH loses 1 HCl giving excellent yield (1) of 3-chlorohexatetraene-1,3,4,5 (3:7735).

C̄ on oxidn. with aq. $KMnO_4$ yields (1) chloroacetic acid (3.1370).

3:9304 (1) Coffman, Carothers, *J. Am. Chem. Soc.* **55**, 2040–2047 (1933). (2) Nieuwland, Calcott, Downing, Carter, *J. Am. Chem. Soc.* **53**, 4200–4202 (1931).

3:9306 1,3,4,6-TETRACHLOROHEXADIENE-2,4 $C_6H_6Cl_4$ **Beil. S.N. 12**

B.P. 84–89° at 2 mm. (1) D_4^{20} **= 1.4013 (1)** n_D^{20} **= 1.5465 (1)**

[For prepn. of C̄ from hexadien-2,5-yne-3 (divinylacetylene) (2) with Cl_2 at −40° to −50° (together with other products) see (1).]

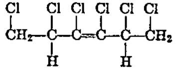
C̄ treated directly with Cl_2 for 8 hrs. at 60–70° gives (23% yield (1)) 1,2,3,4,5,6-hexachlorohexene-3 (3:1220), m p 57–58° (1)

C̄ refluxed for 8 hrs. with stirring with aq Na_2CO_3 soln. gives (1) chloride ion corresp. to two of the initial four chlorine atoms. — C̄ with abs. MeOH/KOH at 10–15° loses HCl in each of two ways yielding (1) both 1,3,4-trichlorohexatriene-2,4,5 (3:9302) and 3,4-dichlorohexatetraene-1,2,4,5 (3:9300).

C̄ on oxidn. with aq. $KMnO_4$ for 5 hrs. at 35–40° gives (1) chloroacetic acid (3:1370).

3:9306 (1) Coffman, Carothers, *J Am. Chem Soc.* **55**, 2040–2047 (1933). (2) Nieuwland, Calcott, Downing, Carter, *J. Am. Chem Soc* **53**, 4200–4202 (1931)

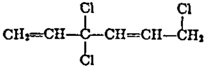
— **1,2,3,4,5,6-HEXACHLOROHEXENE-3** $C_6H_6Cl_6$ **Beil. S.N. 11**



B.P. 110–112° at 2 mm. **M.P. 58–59°**

See 3:1220. *Division A: Solids.*

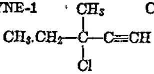
3:9308 3,3,6-TRICHLOROHEXADIENE-1,4 $C_6H_7Cl_3$ **Beil. S.N. 12**



B.P. 100–103° at 4 mm. (1) D_4^{20} **= 1.3036 (1)** n_D^{20} **= 1.5585 (1)**

3:9322 3-CHLORO-3-METHYLPENTYNE-1 C_6H_9Cl Beil. S.N. 12

(Ethyl-ethynyl-methyl-carbinyl chloride)



B.P. 55° at 130 mm. (1) D_4^{20} = 0.9163 (1) n_D^{20} = 1.4330 (1) (2)
51–52° at 135 mm. (2) 0.9140 (2)
48–50° at 100 mm. (3) 0.9141 (3) n_α^{20} = 1.42963 (3)

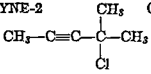
[For prepn. of C̄ from 3-methylpentyn-1-ol-3 (ethyl-ethynyl-methyl-carbinol) by shaking with *conc.* HCl (40% yield (2)) best overnight (60% yield (1)); if the acid also contains $Cu_2Cl_2 + NH_4Cl$, C̄ is accompanied (3) by 1-chloro-3-methylpentadiene-1,2 (3:9314).] [Note that dry HCl at 0° reacts with the alc. only slightly while PCl_3 + pyridine gave a product difficult to purify (1).]

C̄ with CH_3MgBr gives (66% yield (1)) 3,3-dimethylpentyne-1, b.p. 69° at 100 mm, D_4^{20} = 0.7610, n_D^{20} = 1.4360; C̄ with C_2H_5MgBr gives (61% yield (1)) 3-ethyl-3-methylpentyne-1, b.p. 88° at 100 mm., D_4^{20} = 0.7714, n_D^{20} = 1.4386. [In orig. paper these products are incorrectly numbered and named.]

... *Chem. Soc.* **62**, 1798–1800 (1940). (2) K. N. Campbell, B. K. ... **0**, 2882–2884 (1938). (3) Favorskaya, Zakharova, *J. Gen.* ... *C.A.* **34**, 7844 (1940).

3:9324 4-CHLORO-4-METHYLPENTYNE-2 C_6H_9Cl Beil. S.N. 12

(Trimethylpropargyl chloride)



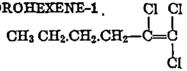
B.P. 57–61° at 47 mm. (1) n_D^{20} = 1.4143 (1)

[For prepn. of C̄ (33% yield (1)) from 2-methylpropyn-3-ol-2 (trimethylpropargyl alcohol) with PCl_3 in dry ether see (1).]

C̄ in acetone refluxed 4 hrs. with K_2CO_3 and phenol gives (69% yield (1)) phenyl trimethylpropargyl ether, n_D^{20} = 1.3408, but undistillable without decomposition (1).

3:9324 (1) Hurd, Cohen, *J. Am. Chem. Soc.* **53**, 1074 (1931).

3:9326 1,1,2-TRICHLOROHEXENE-1 $C_6H_9Cl_3$ Beil. S.N. 11



B.P. 90–93° at 10 mm. (1) (2) D_-^{25} = 1.225 (1) (2) n_D^{25} = 1.4760 (1) (2)

This compound was at first (2) thought to be 1,2,2-trichlorohexane but later (1) was established as C̄.

[For formn. of C̄ from hexyne-1 (*n*-butylacetylene) (1:8055) with Cl_2 in aq. *ter*-BuOH, MeOAc, AcOH, or Ac_2O at 45° (2) or in 35% aq. HCl, 30% aq. H_2SO_4, 30% H_3PO_4, or 22% MeOH/HCl (1) see indic. refs.]

3:9326 (1) Norris, Hennion, *J. Am. Chem. Soc.* **62**, 449–450 (1940). (2) Norris, Vogt, Hennion, *J. Am. Chem. Soc.* **61**, 1460–1461 (1939).

with conc. HCl contg. $Cu_2Cl_2 + NH_4Cl$ see (1) (considerable 3-chloro-3-methylpentyne-1 (3:9322) is also formed).]

$\bar{C}$ on stdg. 8 months with Cu_2Cl_2, NH_4Cl, plus a few drops conc. HCl isomerized to 1-chloro-3-methylbutadiene-1,3 (3:7355) (1).

3:9314 (1) Favorskaya, Zakharova, *J. Gen. Chem.* (*U.S.S R.*) **10**, 446–450 (1940); *C.A.* **34**, 7844 (1940).

3:9316 1-CHLORO-3-METHYLPENTADIENE-1,3 C_6H_9Cl **Beil. S.N. 12**

$$CH_3{-}CH{=}\overset{\displaystyle CH_3}{\overset{|}{C}}{-}CH{=}\overset{\displaystyle Cl}{\overset{|}{C}}H$$

B.P. 62–63° at 100 mm. (1) D_4^{20} = **0.9574 (1)** n_α^{20} = **1.47714 (1)**

[For prepn. of $\bar{C}$ from 1-chloro-3-methylpentadiene-1,2 (3:9314) by stdg 8 months with Cu_2Cl_2, NH_4Cl, plus a few drops conc. HCl see (1).]

$\bar{C}$ reacts with maleic anhydride (1·0625) to give a mixt. from which after hydrolysis two acids, one m.p. 218–220°, the other, m.p 350–351°, are obtd. (1).

3:9316 (1) Favorskaya, Zakharova, *J. Gen. Chem.* (*U.S.S R*), **10**, 446–450 (1940); *C.A.* **34**, 7844 (1940).

3:9318 2-CHLORO-3-METHYLPENTADIENE-1,3 C_6H_9Cl **Beil. S.N. 12**

$$CH_3{-}CH{=}\overset{\displaystyle CH_3}{\overset{|}{C}}-\overset{\displaystyle Cl}{\overset{|}{C}}{=}CH_2$$

B.P. 57–60° at 96 mm. (1) D_4^{20} = **0.9437 (1)** n_D^{20} = **1.4671 (1)**

[For prepn. of $\bar{C}$ from 3-methylpenten-2-yne-4 in 22% yield (1) by shaking for 5½ hrs at 20° with conc. HCl contg. $Cu_2Cl_2 + NH_4Cl$ see (1).]

$\bar{C}$ on htg with 2 pts. naphthoquinone-1,4 (1.9040) for 1 hr. at 100° gives (1) on cooling 2-chloro-3,4-dimethyltetrahydroanthraquinone, colorless ndls *from* aq. acetone, m p 107° (1); suspension of this intermediate in dil. alc NaOH and aeration until the purple solution becomes yellow gives (1) 2-chloro-3,4-dimethylanthraquinone, yel. cryst. from AcOH, m p. 171.5° (1).

[For polymerization of $\bar{C}$ see (1) (2).]

3:9318 (1) Carothers, Coffman, *J. Am. Chem. Soc.* **54**, 4075–4076 (1932). (2) Carothers, Coffman (*to* du Pont), U.S. 1,950,441, March 13, 1934; *Cent.* **1934**, II 1038, *C.A.* **28**, 3270 (1934).

3:9320 1-CHLOROHEXYNE-1 C_6H_9Cl **Beil. S.N. 12**

$$CH_3.CH_2.CH_2\,CH_2{-}C{\equiv}C{-}Cl$$

B.P. 47° at 55 mm. (1) n_D^{-} = **1.43350 (1)**

[For prepn. of $\bar{C}$ from hexyne-1 (1:8055) by conversion in liq NH_3 to $C_4H_9.C{\equiv}C{-}K$ and treatment of this prod. in ether suspension with Cl_2 at −32° see (2) (3); for prepn. of $\bar{C}$ from $C_4H_9\,C{\equiv}C.Na$ with benzenesulfonyl chloride in ether see (1) (4).]

$\bar{C}$ in MeOH + HgO + BF_3 as specified (2) adds 2 MeOH giving in 83% yield 1-chloro-2,2-dimethoxyhexane, b p 77–80° at 14 mm , D_{-}^{25} = 0 9873, n_D^{25} = 1.4305 (2).

3:9320 (1) Pflaum, Wenzke, *J. Am. Chem. Soc* **56**, 1106–1107 (1934). (2) Verbanc, Hennion, *J. Am. Chem. Soc.* **60**, 1711–1713 (1938). (3) McCusker, Vogt, *J. Am. Chem. Soc.* **59**, 1308–1309 (1937). (4) Truchet, *Ann. chim.* (10) **16**, 309–416 (1931).

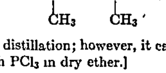
[For prepn. of C̄ from 3-methylhexen-2-ol-4 [Beil. I-447, I_1-(229)] with 6 *N* HCl see (1)].

3:9414 (1) Abelmann, *Ber.* **43**, 1581 (1910).

3:9418 4-CHLORO-2,4-DIMETHYLPENTENE-2 $C_7H_{13}Cl$ **Beil. S.N. 11**

(2-Chloro-2,4-dimethylpentene-3; trimethylcrotyl chloride)



[C̄ is too unstable for purification by distillation; however, it can be prepared in solution from 2,4-dimethylpenten-3-ol-2 (1) with PCl_3 in dry ether.]

benzene (3:1400) with Cl_2 in pres. of Al/Hg see (11); from benzene (12), chlorobenzene (13), or diphenyl sulfone (14) with Cl_2 followed by treatment with alc. KOH see indic. refs.]

[For behavior of C̄ with liq. Cl_2 yielding addn. products see (15).]

[For behavior of C̄ with NaOMe see (2) (16).]

C̄ on mononitration, e.g., by boilg. for ½ hr. with 3 pts. HNO_3 ($D = 1.52$) as directed (17), gives 96.7% yield (17) 1,2,3,5-tetrachloro-4-nitrobenzene, cryst. from spontaneous evapn. of alc. soln., m.p. 40–41° (17) (the m.p. of 21–22° previously reported (5) was on impure material).

C̄ on dinitration, e.g., by boilg. with a mixt. of 10 pts. fumg. HNO_3 ($D = 1.52$) + 4 pts. conc. H_2SO_4 for 1 hr. and then pouring into aq. (17), gives (100% yield (17)) (9) 1,2,3,5-tetrachloro-4,6-dinitrobenzene [Beil. V-266], pl. from 90% AcOH, m.p. 162° (9), 161–162° (17). (This prod. on htg. with aniline yields (9) (18) 2-chloro-1,3,5-trianilino-4,6-dinitrobenzene, crimson pl., m.p. 179° (9), 179–180° (18).)

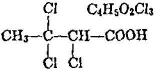
3:0925 α,β,β-TRICHLORO-*n*-BUTYRIC ACID $C_4H_5O_2Cl_3$ Beil. II-281, II_1—, II_2—



M.P. 51.5–52° (1)

Tbls from lgr. — Spar. sol. aq., eas. sol. alc., ether, C_6H_6, $CHCl_3$, CS_2.

[For prepn. of C̄ from either β-chlorocrotonic acid (3:2625) or β-chloroisocrotonic acid (3:1300) in CS_2 soln. with Cl_2 stood several days in the dark see (1).]

[C̄ in aq. with granulated Zn stood for 6 weeks, then acidified, yields (1) mainly β-chloroisocrotonic acid (3:1300) *accompanied by some β-chlorocrotonic acid (3:2625); note that* former is separated from latter by its greater volatility with steam.]

C̄ with aq. Na_2CO_3 soln. on boilg. loses both HCl and CO_2 yielding the higher-boilg. (1) 1,2-dichloropropene-1 (3:5150).

C̄ with alc. KOH (2 moles) loses HCl yielding (1) mainly α,β-dichloroisocrotonic acid [Beil. II-418], m.p. 75.5°, accompanied by a little α,β-dichlorocrotonic acid [Beil. II-418], m.p. 92°; note that these are separated by the greater soly. of the former in lgr. (1).

The acid chloride corresp. to C̄ is unreported.

—— Methyl α,β,β-trichloro-*n*-butyrate: unreported.
—— Ethyl α,β,β-trichloro-*n*-butyrate: unreported.
—— α,β,β-Trichloro-*n*-butyramide: unreported.
—— α,β,β-Trichloro-*n*-butyranilide: unreported.
—— α,β,β-Trichloro-*n*-butyr-α-naphthalide: unreported.

[For prepn. of C̄ from heptanone-4 (butyrone) (1:5447) with PCl_5 see (1); note that heptyne-3 (1:8095), b.p. 105–106°, and 4-chloroheptene-3 (3:8023) are also formed (1). The earlier prepns. are regarded as impure.]

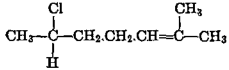
3:9518 *d,l*-3-CHLORO-OCTENE-1 $C_8H_{15}Cl$ **Beil. S.N. 11**

No record of this compound can be found in the literature.

[Note, however, that the levorotatory enantiomorph has been reported (1).]

3:9518 (1) Levene, Rothen, *J. Chem. Phys.* **5**, 982 (1937).

3:9520 6-CHLORO-2-METHYLHEPTENE-2 $C_8H_{15}Cl$ **Beil. I —**
I_1—
I_2-(200)



B.P. 60–61° at 15 mm. (1) D_4^{18} **= 0.8931 (1)** n_D^{18} **= 1.4458 (1)**
59–61° at 15 mm. (2)

Colorless mobile liq., insol. aq., sol. in usual org. solvents.

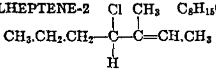
[For prepn. from 2-methylhepten-2-ol-6 [Beil. I-448, I_1-(230), I_2-(490)] with $SOCl_2$ + pyridine (39% yield (1)) see (1) (2).]

C̄ could not be induced to yield an R.MgCl cpd. (2).

C̄ in AcOH treated with O_3 and the soln. subsequently shaken with Zn dust gives (61% yield (1)) γ-chloro-*n*-valeraldehyde, b.p. 70–71° at 16 mm. (1).

3:9520 (1) Helferich, Dommer, *Ber.* **53**, 2008–2009 (1920). (2) Doeuvre, *Bull. soc. chim.* (4) **45**, 359–360 (1929).

3:9524 *d,l*-4-CHLORO-3-METHYLHEPTENE-2 $C_8H_{15}Cl$ **Beil. I —**
I_1-(94)
I_2—



[For prepn. of C̄ from 3-methylhepten-2-ol-4 (1) with 6 *N* HCl see (1).]

3:9524 (1) Abelmann, *Ber.* **43**, 1581 (1910).

3:9525 4-CHLORO-6-METHYLHEPTENE-2 $C_8H_{15}Cl$ Beil. S.N. 11
(4-Chloro-2-methylheptene-5)

B.P. 57° at 13 mm. (1)

[For prepn. of C̄ from 6-methylhepten-2-ol-4 with HCl see (1).]

3:9525 (1) Knorr (to I.G.), Ger. 553,279, June 24, 1932; *Cent.* **1932**, II 2370; *C.A.* **26**, 4611 (1932).

3:9526 5-CHLORO-4-METHYLHEPTENE-3 $C_8H_{15}Cl$ Beil. I — I_1-(94) I_2-(201)

B.P. 75–78° at 53 mm. (1)

Two geom. stereoisomers of C̄ are possible, but only this one is as yet recorded.

[For prepn. of C̄ from 4-methylhepten-3-ol-5 [Beil. I_1-(201), I_2-(491)] by distn. with conc. HCl (1) (3) or by saturation with dry HCl gas at 0° (2) see indic. refs.]

C̄ is very reactive toward aq; at 15° C̄ is 93% hydrolyzed in 48 hrs., at 45–50° 90% hydrolyzed in 75 min (2)

C̄ on oxidn. with $Na_2Cr_2O_7 + H_2SO_4$ at 45–50° yields (2) 4-methylhepten-3-one-5 [Beil. I_2-(799)], b.p. 170–172° at 735 mm, 96–98° at 70 mm, $D_4^{15} = 0.8773$, $n_D^{15} = 1.4510$ (2,4-dinitrophenylhydrazone, m.p. 147°, semicarbazone, m.p. 167° (2)).

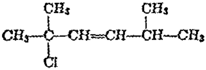
3:9527 2-CHLORO-2,5-DIMETHYLHEXENE-3 $C_8H_{15}Cl$ Beil. S.N. 11
(Di-isocrotyl hydrochloride)



C̄ has never been reported in pure form; note that, in addition to the possibility of existence of two geometrical stereoisomers, C̄ by virtue of allylic rearrangement can yield 4-chloro-2,5-dimethylhexene-2 (3:9529) q.v.

[For prepn. of C̄ (as a mixt. with some or all of these other compds.) from 2,5-dimethylhexadiene-2,4 ("di-isocrotyl") [Beil. I-259, I_1-(122), I_2-(237)] by addn. of dry HCl gas see (1); note that the reaction prod. has b.p. 45–60° at 15 mm., $n_D^{20} = 1.45$ to 1.46, and although stable in the cold decomposes on attempts to effect fractional distn.]

[C̄ with MeMgCl *yields* (1) *mainly* 2,4,5-trimethylhexene-2 [Beil. I_1-(95)], b.p. 128.4° at 760 mm. (1), $D_4^{20} = 0.7403$ (1), $n_D^{20} = 1.4268$ (1), accompanied by some 2,2,5-trimethylhexene-3, b.p. 114° at 760 mm. (1), $n_D^{20} = 1.416$ (1).]

3:9527 (1) Henne, Chanan, Turk, *J. Am. Chem. Soc.* **63**, 3474–3476 (1941).

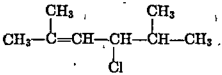
3:9528 4-CHLORO-3,5-DIMETHYLHEXENE-2 $C_8H_{15}Cl$ Beil. I — I_1-(94) I_2—

B.P. 58–60° at 21 mm. (1)

[For prepn. of C̄ from 2,4-dimethylhexen-4-ol-3 (1) with 6 N HCl (80% yield) see (1).]

3:9528 (1) Abelmann, *Ber.* **43**, 1581–1582 (1910).

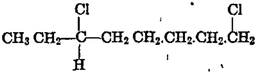
3:9529 4-CHLORO-2,5-DIMETHYLHEXENE-2 $C_8H_{15}Cl$ Beil. S.N. 11



C̄, the allylic rearr. prod. of 2-chloro-2,5-dimethylhexene-3 (3:9527) q.v., has never been reported in pure form (1).

3:9529 (1) Henne, Chanan, Turk, *J. Am. Chem. Soc.* **63**, 3474–3476 (1941).

3:9530 *d,l*-1,6-DICHLORO-OCTANE $C_8H_{16}Cl_2$ Beil. I —
I_1—
I_2-(124)

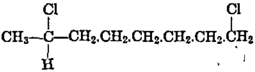


B.P. 105–107° at 16 mm. (1)

[For prepn. of C̄ from N-benzoyl-2-n-propylpiperidine (N-benzoylconiine) [Beil. XX-116] by conversion with PCl_5 to the amide-chloride $C_8H_{16}N.C(Cl)_2.C_6H_5$ followed by rapid distn. of the latter see (1).] [This prod. was originally (1) thought to be 1,5-dichloro-octane [Beil. I-160] but is now regarded (2) as C̄.]

3:9530 (1) von Braun, Schmitz, *Ber.* **39**, 4366 (1906). (2) von Braun, Pohl, *Ber.* **57**, 482–483 (1924).

3:9532 *d,l*-1,7-DICHLORO-OCTANE $C_8H_{16}Cl_2$ Beil. I-160
I_1—
I_2—



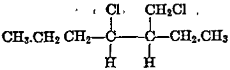
B.P. 132–138° at 20-25 mm. (1)

[For prepn. of C̄ from octamethylenediamine [Beil. IV-271] with NOCl see (1). The prod. is admittedly impure and contains also 8-chloro-octene-2 and 1,8-dichloro-octane (3:8805).]

C̄ on htg. with sodium phenolate yields (1) 1,7-diphenoxyoctane [Beil. VI-148], b.p. 240–250° at 20–25 mm., not volatile with steam.

3:9532 (1) Ssolonina, *J. Russ. Phys.-Chem. Soc.* **30**, 620–621 (1898); *Cent.* **1898**, I 26.

3:9534 4-CHLORO-3-(CHLOROMETHYL)-HEPTANE $C_8H_{16}Cl_2$ Beil. S.N. 10

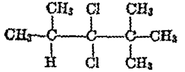


B.P. 50° at 0.2 mm. (1)

[For prepn. of C̄ from 2-ethylhexanediol-1,2 with conc. HCl at 120° see (1).]

3:9534 (1) von Braun, Manz, *Ber.* 67, 1704–1705 (1934).

3:9536 3,3-DICHLORO-2,2,4-TRIMETHYLPENTANE $C_8H_{16}Cl_2$ Beil. I —
(Pentamethylacetone dichloride) I_1-(62)
I_2—



B.P. 122–125° at 19 mm. (1)

[For prepn. of C̄ from 2,2,4-trimethylpentanone-3 (pentamethylacetone) [Beil. I-708, I_1-(364), I_2-(760)] with PCl_5 in s.t. for 60 hrs. at 140° (1) (together with other products) see (1).]

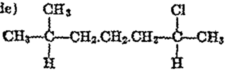
3:9536 (1) Favorskii, Fritzman, *J. Russ. Phys.-Chem. Soc.* **44**, 1353 (1912); *Cent.* **1913**, I 1007; *C.A.* 7, 985 (1913); *J. prakt. Chem.* (2) 88, 654 (1913).

3:9538 *d,l*-4-CHLORO-OCTANE $C_8H_{17}Cl$ **Beil. S.N. 10**
(*n*-Butyl-*n*-propyl-carbinyl chloride)

C̄ as such is as yet unreported; however, the dextrorotatory isomer of C̄ has been obtd. (1) *from the metathesis of levorotatory 4-iodooctane with LiCl in MeOH; b.p. 92° at 50 mm.*

3:9538 (1) Levene, Rothen, Kuna, *J. Biol. Chem.* **120**, 786 (1937).

3:9540 *d,l*-6-CHLORO-2-METHYLHEPTANE $C_8H_{17}Cl$ **Beil. S.N. 10**
(Isohexyl-methyl-carbinyl chloride)



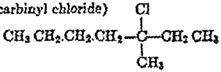
B.P. 74–75° at 35 mm. (1) n_D^{15} = **1.4260 (1)**

[For prepn. of C̄ from 2-methylheptanol-6 [Beil. I-421, I_1-(209), I_2-(453)] with $SOCl_2$ in cold $CHCl_3$ + dimethylaniline, then refluxed 2 hrs., see (1).]

C̄ with activated Mg in dry ether gives with difficulty not over 41% of RMgCl (by carbonation and titration of the resultant acid (1)).

3:9540 (1) Peak, Robinson, *J. Chem. Soc.* **1937**, 1589–1590.

3:9544 3-CHLORO-3-METHYLHEPTANE $C_8H_{17}Cl$ **Beil. S.N. 10**
(*n*-Butyl-ethyl-methyl-carbinyl chloride)

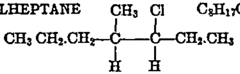


B.P. 64–65° at 27 mm. (1) D_4^{25} = **0.8720 (2)** n_D^{25} = **1.4293 (3)**
55° at 15 mm. (2) D_4^{20} = **0.8764 (2)** n_D^{20} = **1.4317 (3)**
1.4314 (1)
1.4205 (2)

[For prepn. of C̄ from 3-methylheptanol-3 (*n*-butyl-ethyl-methylcarbinol) [Beil. I-421, I_2-(453)] (1) (2) with dry HCl gas at −10° (2) or at 10–15° (92% yield (1)) see indic. refs.]
C̄ with Mg in dry ether as specified (1) gives 70% yield corresp. RMgCl.
C̄ converted as above to RMgCl, treated with formaldehyde gas, gives (31% yield (1)) 2-ethyl-2-methylhexanol-1, b.p. 85.5–86° at 11 mm., $n_D^{20} = 1.4401$ (1).

3:9544 (1) Whitmore, Badertscher, *J. Am. Chem. Soc.* **55**, 1560–1562, 1565 (1933). (2) Whitmore, Woodburn, *J. Am. Chem Soc.* **55**, 361–365 (1933). (3) Smart, Quayle, *J. Am. Chem. Soc.* **67**, 21 (1945).

3:9548 3-CHLORO-4-METHYLHEPTANE $C_8H_{17}Cl$ Beil. I —
I_1-(61)
I_2—



B.P. 83–86° at 79 mm. (1)

[For prepn. of C̄ from 4-methylheptanol-3 with PCl_5 see (1).]

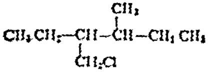
3:0558 2-CHLORO-3,4-DIMETHYLHEXANE $C_8H_{17}Cl$ Beil. S.N. 10

No physical constants on this compound are recorded; for its formation, however, as a by-product of the addition of HCl to butene-2 see (1).

3:0558 (1) Coffin, Sutherland, Maass, *Can. J. Research* **2**, 275–278 (1930).

3:0560 4-(CHLOROMETHYL)-3-METHYLHEXANE $C_8H_{17}Cl$ Beil. S.N. 10



150° (42) (40), 149° (41); C̄ with acenaphthene gives (65–68% yield (43)) 5-(phenylacetyl)-acenaphthene (4-acenaphthyl benzyl ketone), m.p. 114° (43); C̄ with bromobenzene (in CS_2) gives (44) 4-bromodesoxybenzoin, m.p. 114–115°, b p. 165° at 3 mm. (44).] — [For *oxidn. of many of these with SeO_2 to corresp. benzils see* (38).]

[C̄ with phenols + $AlCl_3$ (often in nitrobenzene) similarly yields hydroxy-substituted desoxybenzoins: *e g.*, C̄ with phenol as directed gives (60–70% yield (45)) 4-hydroxydesoxybenzoin [Beil. VIII-165], m.p. 142° cor. (45); C̄ with *o*-cresol gives (60–70% yield (46)) 4-hydroxy-3-methyldesoxybenzoin [Beil. VIII-183], m.p. 152° (46); C̄ with salicylic acid (1:0780) gives (47) 4-hydroxy-3-carboxy-desoxybenzoin; for similar reactn. with catechol resorcinol, and hydroquinone (48) or with phloroglucinol (49) see indic. refs.]

[C̄ with phenol ethers + $AlCl_3$ (often in nitrobenzene) similarly yields substituted desoxybenzoins: *e.g.*, C̄ with anisole (1:7445) + $SnCl_4$ (51) or $AlCl_3$ (34) (50) gives 4-methoxydesoxybenzoin [Beil. VIII-166, $VIII_1$-(571)], m.p. 77°; C̄ with methyl *m*-tolyl ether (1:7510) + $SnCl_4$ (not $AlCl_3$) gives (60–70% yield (51)) (50) 4-methoxy-2-methyl-*desoxybenzoin, m.p. 76.5° (51); C̄ with methyl p-tolyl ether (1:7495) + $AlCl_3$ in CS_2* gives (11) 2-methoxy-5-methyldesoxybenzoin, m.p. 75°, b.p. 205–207° at 14 mm. (11).]

C̄ with phenols on htg. gives corresp. esters: *e.g.*, C̄ with phenol at 150° for 8 hrs. (6) (or C̄ with phenol + aq. alk. (52)) yields phenyl phenylacetate [Beil. IX-435], ndls. from lt. pet., m.p. 50° (6), 42° (52); C̄ with *β*-naphthol at 150° for 6 hrs. yields (6) *β*-naphthyl phenylacetate, pl. from lt. pet., m.p. 87° (6); C̄ with *o*-cresol at 90° yields (9) *o*-tolyl phenylacetate, m.p. 44–45° (9); C̄ with *m*-cresol at 90° yields (9) *m*-tolyl phenylacetate, m p. 51–52° (9); C̄ with *p*-cresol at 90° yields (9) *p*-tolyl phenylacetate, m.p. 74–75° (9).

[C̄ with MeZnI (53) in toluene + EtOAc or with Me_2Zn (54) gives (72% yield (53)) benzyl methyl ketone (phenylacetone) (1:5118); C̄ with EtZnI (53) or with Et_2Zn (54) gives (78% yield (53)) benzyl ethyl ketone [Beil. VII-314, VII_1-(167)]]

[C̄ + o-hydroxyacetophenone (1:1746) + NaĀ at 180° for 6 hrs. followed by hydrol. with alc. KOH gives (6) 4-methyl-3-phenylcoumarin, m.p. 153° (6); C̄ with 2-hydroxy-5-methylbenzophenone + NaĀ at 180° gives (80–90% yield (55)) 3,4-diphenyl-6-methylcoumarin, cryst. from AcOH, m.p. 208–209° (55).]

[C̄ with diazomethane in ether gives acc. to cond. (56) (57) (58) (62) either (yield: 84% (56), 83% (62)) *α*-chloro-*γ*-phenylacetone [Beil. VII_1-(162)], m p. 72–73° (56), b.p. 133–135° at 19 mm. (62), $n_D^{20} = 1.5379$ (62), or *α*-diazo-*γ*-phenylacetone (identified by reactn. with *p-nitrobenzoic acid yielding (58) α-(p-nitrobenzoyloxy)-α-phenylacetone,* pl. *from* alc., m.p. 120° (58)); note, however, that work of (56) could not be duplicated by later investigators (58) (62).]

[C̄ with biuret yields (59) N_1-(phenylacetyl)biuret, cryst. from alc., m.p. 199–200° u.c. dec. (59).]

[C̄ with ethyl carbamate (urethane) at 60–70° gives (70% yield (60)) ethyl *N*-(phenylacetyl)carbamate, m.p. 113° (60).]

[C̄ with MeOH yields methyl phenylaretate (1:3771), b.p. 220°; C̄ with EtOH yields *ethyl phenylacetate (1:3872),* b.p. 227.5°.] [For use in prepn. of cellulose esters see (61).]

C̄ on hydrolysis yields phenylacetic acid (1:0665), m.p. 76.5°; for the amide, anilide, *p*-toluidide, and other derivs. corresp. to C̄ see phenylacetic acid (1:0665)

3:9570 *dl*-CHLOROMETHYL-PHENYL-CARBINOL C_8H_9OCl Beil. VI —
(β-Hydroxy-β-phenylethyl chloride, VI₁-(236)
α-(chloromethyl)benzyl alcohol, VI₂-(446)
styrene chlorohydrin)

B.P. 128° at 17 mm. (1) n_D^{22} = 1.5538 (2)
118-120° at 14 mm. (2) 1.5520 (2)
112-114° at 10 mm. (3) $D_4^{20.5}$ = 1.1610 (1) $n_D^{20.5}$ = 1.5400 (1)
110-111° at 6 mm. (4)
110-112° at 5 mm. (5) $D_4^{?}$ = 1.225 (1) n_D^{17} = 1.55103 (1)

[For prepn. of C̄ from phenylethylene (styrene) (1:7435) by addition of HOCl generated from $Ca(OCl)_2 + CO_2$ (76% yield (2)), from $NaOCl + CO_2$ (6), from *N*-chlorourea + AcOH (yield: 70% (1), 52% (4)), or from *tert*-butyl hypochlorite (3:7165) in dil. AcOH (60-70% yield (4)) see indic. refs. (note that omission of AcOH in *tert*-BuOCl method leads to formn. by direct addn. (4) of chloromethyl-phenylcarbinyl *tert*-butyl ether, b.p. 67-68° at 1.5 mm., D_4^{15} = 1.0549, n_D^{15} = 1.5102 (4)).]

[For prepn. of C̄ from chloroacetaldehyde (3:7212) with C_6H_5MgBr in ether (71% yield (3)) or from α,β-dichloroethylbenzene (styrene dichloride) (3:6985) with a mild dehydrochlorinating agent such as Na_2CO_3, NaOAc, CaO, or $CaCO_3$ (but not an alkali hydroxide) and water (2) see indic. refs.]

[C̄ with alc. KOH (1) or with an alk. or alk. earth metal oxide or hydroxide as directed (7) (8) loses HCl with ring closure to phenylepoxyethane (styrene oxide) (Beil. XVII-49) (7), b.p. 191-192°, but no phenylacetaldehyde (1:0200) is formed (1) (for use of this

conversion to remove $\bar{C}$ from mixtures with styrene dichloride (3:6685) see (7) (8)). — However, $\bar{C}$ with NaOEt gives (yield not reported (1)) cf. (3) ethyl β-hydroxy-β-phenylethyl ether [Beil. VI-907], b.p. 242–243°.]

[$\bar{C}$ on dehydration by passing over HPO_3 on silica gel at 370–400° and 95–115 mm. press. gives (63% yield (9)) β-chlorostyrene (3:8717).]

[$\bar{C}$ on passing over activated Al_2O_3 at 360–390° and 115–125 mm. press. gives (67% yield (9)) acetophenone (1:5515), but $\bar{C}$ on passing over $CaCO_3$ on silica gel at 325–350° and 105–125 mm. press. gives (51% yield (9)) phenylacetaldehyde (1:0200).]

$\bar{C}$ with pyridine at 120° for 6 hrs. gives in quant. yield (10) the corresp. quaternary pyridinium salt; m.p. 210–212° dec., sol. in aq., MeOH, EtOH, but spar. sol. in other org. solvents.

$\bar{C}$ on oxidn. with $K_2Cr_2O_7/H_2SO_4$/AcOH at low temp. (1) cf. (4) gives (84% yield (4)) ω-chloroacetophenone (phenacyl chloride) (3:1212).

——*Chloromethyl-phenyl-carbinyl acetate: b.p. 101–104° at 3 mm.*, $n_D^{12} = 1.5182$ (4). [From $\bar{C}$ with Ac_2O + pyridine (66% yield (4)).]

—— **Chloromethyl-phenyl-carbinyl benzoate:** unreported.

Ⓓ **Chloromethyl-phenyl-carbinyl *p*-nitrobenzoate:** m.p. 81° (4). [From $\bar{C}$ with *p*-nitrobenzoyl chloride in pyridine (4).]

—— **Chloromethyl-phenyl-carbinyl 3,5-dinitrobenzoate:** unreported.

3:9576 SUBERYL (DI)CHLORIDE $C_8H_{12}O_2Cl_2$ Beil. II - 694, II_1-(287), II_2-(596)

$$\underset{\displaystyle Cl}{\overset{}{O{=}\underset{|}{C}}}{-}(CH_2)_6{-}\underset{\displaystyle Cl}{\overset{}{\underset{|}{C}{=}O}}$$

B.P. 162–163°	at 15 mm., sl. dec.	(1)
159–160°	at 12 mm.	(2)
149–150°	at 12 mm.	(3)
147°	at 12 mm.	(4)
143–147°	at 12 mm.	(5)

$D_4^{20.8} = $ **1.1718** (3) $n_D^{20.6} = $ **1.46847** (3)

[For prepn. of $\bar{C}$ from suberic acid (1:0755) with PCl_5 (1), with PCl_3 (4), or with $SOCl_2$ (yield: 100% (2)) (3) (5) (6) (8) (10) see indic. refs.]

[$\bar{C}$ with excess MeOH yields (6) dimethyl suberate (1:4186), b.p. 268°. $\bar{C}$ with 1 mole MeOH should yield 7-carbomethoxyheptanoyl chloride-1, b.p. 163–165° at 34 mm. (7), usually prepd. from methyl hydrogen suberate with $SOCl_2$ (7).]

$\bar{C}$ with excess phenol htd. at 100° yields (8) diphenyl suberate, m p. 70–71° (8).

$\bar{C}$ htd. with dry disodium suberate yields (1) suberic anhydride, m.p. 65–66° (1), presumably the linear polymeric suberic α-anhydride (cf. 1:0755).

$\bar{C}$ with $AlCl_3$ + C_6H_6 yields (1) (4) 1,8-diphenyloctanedione-1,8, m.p. 85° (4), 83–85° (1) (dioxime, m.p. 192–193° (1)).

[$\bar{C}$ on cat. hydrogenation over Pd/diatomaceous earth as directed (9) yields suberic dialdehyde (octanedial-1,8), (*bis*-oxime, m p. 152° (9), *bis*-phenylhydrazone, m.p. 84–86° u.c. (9), *bis*-semicarbazone, m.p. 183–186° (9)) cf. (2).]

$\bar{C}$ converted to RMgCl (as above) and treated with ethereal $HgCl_2$ gives (35% yield (1)) 2,2,3,3-tetramethylbutyl mercuric chloride, *feathery white cryst.*, m.p. *170–171°* (1).

3:0945 (1) Whitmore, Marker, Plambeck, *J. Am. Chem. Soc.* **63**, 1626–1630 (1941).

3:0960 4-CHLORO-2-HYDROXYBENZALDEHYDE $C_7H_5O_2Cl$ **Beil. No. 744**
(4-Chlorosalicylaldehyde)

M.P. 52.5° (1)

Long colorless ndls. from alc. or dil. AcOH (1). — $\bar{C}$ has odor of walnuts (1). — $\bar{C}$ is apprec sol. in aq. or aq. H_2SO_3; readily sol. in org. solvents. — $\bar{C}$ is very volatile with steam even from its yel. soln. in alk. (1).

[For prepn. of $\bar{C}$ from *m*-chlorophenol (3.0255) via Reimer-Tiemann procedure see (1).]

$\bar{C}$ does not reduce $NH_4OH/AgNO_3$ or Fehling soln.; is very resistant to oxidn. by acid, alk., or neutral $KMnO_4$, and to acetylation (but not benzoylation, q.v. below) (1).

$\bar{C}$ with $FeCl_3$ gives brown ppt., with $CuSO_4$ or $Cr_2(SO_4)_3$ + dil. aq. alk. gives bright green copper salt and a dark green chromium salt (1).

$\bar{C}$ on mononitration as specified (2) yields 5-nitro-4-chloro-2-hydroxybenzaldehyde, pale yel. ndls. from alc., m.p. 116° (2) [*This product yields a phenylhydrazone, or.-yel. ndls.*, m.p. 188° dec.; a *p*-nitrophenylhydrazone, brn.-yel. ndls from alc. or AcOH, m.p. 294° dec.; and a semicarbazone, pale yel. ndls from dil. AcOH, dec. above 300° (2).]

$\bar{C}$ on dinitration as specified (2) yields 3,5-dinitro-4-chloro-2-hydroxybenzaldehyde, pale gold.-yel. ndls. from aq., m.p. 153° (2). [This product yields a phenylhydrazone, light brn. cryst. from alc., m.p. 219°; a *p*-nitrophenylhydrazone, light brn. cryst. from dil. AcOH, m.p. 286° dec.; and a semicarbazone, light yel. cryst. from dil. AcOH, m.p. 225° dec. (2).]

Ⓓ **4-Chloro-2-hydroxybenzaldoxime**: colorless ndls. from alc., m.p. 155° (1).

Ⓓ **4-Chloro-2-hydroxybenzaldehyde *p*-nitrophenylhydrazone**: or. ndls. from AcOH, m.p. 257° (1).

Ⓓ **4-Chloro-2-hydroxybenzaldehyde semicarbazone**: pale yel. cryst. from AcOH, m.p. 212° (1).

Ⓓ **4-Chloro-2-benzoxybenzaldehyde**: from $\bar{C}$ + BzCl in ether + pyridine; ndls. from alc., m.p. 98.5° (1).

3:0960 (1) Hodgson, Jenkinson, *J. Chem. Soc.* **1927**, 1740–1741. (2) Hodgson, Jenkinson, *J. Chem. Soc.* **1928**, 2273–2274.

3:9590 8-CHLORO-OCTANOL-1 $CH_2(CH_2)_6.CH_2OH$ (with Cl on the first CH_2) $C_8H_{17}OCl$ Beil. S.N. 24
(ω-Chloro-*n*-octyl alcohol)

B.P. 139° at 18.5 mm. (1)
125–140° at 18 mm. (2)

[For prepn. of C̄ from α,ω-octamethylene glycol (m.p. 63°, b.p. 167–168° at 18 mm. (2)) with conc. HCl as directed (yields: 81% (2), 75% (1), 65% (3)) see indic. refs.]

C̄ with thiophenol in aq. NaOH htd. 3 hrs. gives (2) 8-hydroxy-*n*-octyl phenyl sulfide, pl from lt. pet., m p. 55° [this prod. with $SOCl_2$ gives (2) 8-chloro-*n*-octyl phenyl sulfide, cryst. from aq. alc. at low temp., m.p. 16°].

[C̄ (1 mole) with Et_2NH (3–4 moles) in s t. at 120–160° for 12–15 hrs. gives (88% yield (1)) 8-(diethylamino)octanol-1, b.p. 151° at 12 mm., $D_4^{15.5} = 0.8610$, $n_D^{19} = 1.4570$ (1) cf. (5) (corresp. *p*-nitrobenzoate, m.p. 74° (1)); this prod. with $SOCl_2$ in C_6H_6 yields (1) (5) 8-(diethylamino)-*n*-octyl chloride, b.p. 130.5° at 11 mm., $n_D^{18} = 1.4535$ (1) cf. (5) (corresp B̄.HCl, m.p. 73° (5)).]

C̄ with morpholine gives (4) alm. quant. 8-(4-morpholinyl)octanol-1, b.p. 164.0–164 2° at 5 mm., $D_4^{25} = 0.9675$, $n_D^{27} = 1.4735$ (corresp. *N*-(α-naphthyl)carbamate, m.p. 73.0–74.0° cor.) — C̄ (1 mole) with *N*-phenylpiperazine (2 moles) at 100° for 5 hrs. gives (3) in alm. 100% yield (as salt) *N*-(8-hydroxy-*n*-octyl)-*N'*-phenylpiperazine, m p. 57.0–58 5° cor. (corresp. *N*-phenylcarbamate, m.p. 99.5–100.5° cor.); note that this free base readily absorbs aq. from air to form a monohydrate, m.p. 80–82° (3).

Ⓓ 8-Chloro-*n*-octyl *N*-phenylcarbamate: ndls from aq. alc., m.p. 77° (2).
Ⓓ 8-Chloro-*n*-octyl *N*-(*m*-nitrophenyl)carbamate: m.p. 62° (1).

See 3:0010. *Division A: Solids.*

3:9608 2-CHLORO-3-PHENYLPROPENE-1 C_9H_9Cl Beil. S.N. 473

B.P. 105–107° at 26 mm. (1)

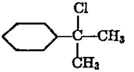
[For prepn. of C̄ from benzyl methyl ketone (phenylacetone) (1:5118) with PCl_5 in C_6H_6 (yield 45.9% accompanied by 26.3% of the mesomeric 2-chloro-1-phenylpropene-1 (3:9606)) see (1).]

C̄ on stdg. isomerizes in part to the mesomeric 2-chloro-1-phenylpropene-1 (3:9606)(1).

C̄ (freshly distilled) with O_3 in $CHCl_3$ contg. some EtOH yields (1) ethyl phenylacetate (1:3872) (note difference from the mesomer).

3:9608 (1) Zaki, Iskander, *J. Chem. Soc.* **1943**, 68–69.

3:9610 α-CHLORO-ISOPROPYLBENZENE (Dimethyl-phenyl-carbinyl chloride; 2-chloro-2-phenylpropane) $C_9H_{11}Cl$ Beil. V - 395 V_1— V_2 - (307)



No physical constants for C̄ appear to have been reported, presumably because of its ease of decomposition.

[For prepn. of C̄ from dimethyl-phenyl-carbinol [Beil. VI-506] by saturation with dry HCl gas at 0° see (1) (2).]

C̄ on htg evolves HCl (1). — C̄ in C_6H_6 + $SnCl_4$ stood for several hours below 10° gives (88% yield) the "saturated dimer of α-methylstyrene," i.e., 1,1,3-trimethyl-3-phenylhydrindene, cryst. from alc., m.p. 52° (3).

C̄ on slow addn. to boilg. alc. KOH (4) or on warming with pyridine (1) (4) loses HCl smoothly giving (70% yield (5)) α-methylstyrene (β-phenylpropylene) [Beil. V-484, V_1-(233)], b.p. 161–162° (5).

C̄ dislvd. in MeOH and merely stood overnight gives (6) the corresponding ether, viz., 2-methoxy-2-phenylpropane, b.p. 78° at 13 mm., $D_4^{20} = 0.945$, $n_D^{20} = 1.4981$ (6).

[For prepn. of C̄ from azelaic acid (1:0695) with PCl_5 (1) or with $SOCl_2$ (2) (3) see indic. refs.]

[C̄ with 1 mole MeOH should yield 8-carbomethoxyoctanoyl chloride-1, b.p. 150–155° at 15 mm. (7), usually prepd. from methyl hydrogen azelate, b.p. 190–195° at 15 mm., m.p. 21–24° (7), with $SOCl_2$ (7).]

C̄ on htg. with disodium azelate yields (1) azelaic anhydride, m.p. 54–56° (1) (this prod. *is probably the linear polymeric α-anhydride (see 1:0695)).*

[C̄ with C_6H_6 + $AlCl_3$ yields (1) 1,9-diphenylnonanedione-1,9, m.p. 44° (1); C̄ with toluene + $AlCl_3$ yields (4) 1,9-di-*p*-tolylnonanedione-1,9, m.p. 78–79° (4).]

C̄ with phenol yields (5) (6) diphenyl azelate, m p 59–60° (6), 49–50° (5).

[C̄ with MeZnI yields (2) undecanedione-2,10, m.p. 64° (2).]

C̄ on hydrolysis yields azelaic acid (1:0695), m.p. 106° (for the diamide, dianilide, di-*p*-toluidide, and other derivs. corresp. to C̄ see 1:0695).

3:9701 2,3,6-TRIMETHYLBENZYL CHLORIDE $C_{10}H_{13}Cl$ Beil. S.N. 469

This compound is apparently unreported although the corresp. 2,3,6-trimethylbenzyl bromide, b.p. 146° at 23 mm., 130–132° at 14 mm., has been obtd. (41% yield (1)) from prehnitene (1,2,3,4-tetramethylbenzene) (1:7548) by bromination.

Certain derivatives of C̄ are, however, recorded here because of the desirability of comparison with the corresp. derivs. of 2,4,5-trimethylbenzyl chloride (3:9702) and of 2,4,6-trimethylbenzyl chloride (3:0372).

—— **2,3,6-Trimethylbenzyl alcohol:** m.p. 83.5–85° (1).
—— **2,3,6-Trimethylbenzyl acetate:** oil, b.p. 152° at 23 mm. (1).

3:9701 (1) *Smith, Agre, J. Am. Chem Soc.* **60**, *652–653 (1938).*

3:9792 METHYL ω-(CHLOROFORMYL)PELARGONATE **Beil. S.N. 178**
(ω-(Carbomethoxy)pelargonyl chloride) $C_{11}H_{19}O_3Cl$

$$CH_3OOC{-}(CH_2)_8{-}\overset{\displaystyle O}{\overset{\|}{C}}{-}Cl$$

B.P. 177°	at 23 mm.	(1)
158–160°	at 10 mm.	(2)

Note that $\bar{C}$ is both an acid chloride and an ester.

[For prepn. of $\bar{C}$ from methyl hydrogen sebacate (itself obtd. (52–61% (2)) from sebacic acid (1:0730) + MeOH (1:6120)) by action of $SOCl_2$ (yields: 83–86% (2), 60–70% (1)) see indic. refs]

Ⓓ ω-(Carbomethoxy)pelargonamide (methyl sebacamate): cryst. from aq., m.p. 77.4° (3), 72–74° (2). [From C̄ with conc. aq. NH_4OH at 8° (yields: 93–95% (2), 90% (3)); for dehydration of this prod. (64–71% yield) (3) with P_2O_5 in acetylene tetrachloride to methyl ω-cyanopelargonate, b.p. 170° at 14 mm., $n_D^{25} = 1.4398$ (3), and use of latter in prepn. of high-mol.-wt. linear polymers (4), see indic. refs.]

3:9792 (1) *Morgan, Walton, J. Chem. Soc.* **1936**, 904. (2) *Bishop, Org. Syntheses* **25**, 71–72 (1945). (3) Biggs, Bishop, *J. Am. Chem. Soc.* **63**, 944 (1944). (4) Bishop (to Bell Telephone Laboratories, Inc.), U.S. 2,277,033, March 24, 1942; *C.A.* **36**, 4636 (1942).

3:9800 *n*-UNDECANOYL CHLORIDE $C_{11}H_{21}OCl$ **Beil. S.N. 162**
(*n*-Hendecanoyl chloride)

$$CH_3.(CH_2)_9.\underset{\displaystyle Cl}{\underset{|}{C}}{=}O$$

B.P. 119–120° at 40 mm. (1) $n_D^5 = 1.4465$ (3)
123° at 11 mm. (2)
90° at 1 mm. (3)

Care must be taken to avoid confusion of C̄ with *n*-undecyl chloride (1-chloroundecane) (3:8803).

[For prepn. of C̄ from *n*-undecylic acid (1:0573) with $SOCl_2$ (yield: 95.5% (1)) (3) (4) see indic. refs.]

[C̄ with $C_6H_6 + AlCl_3$ should give *n*-undecyl phenyl ketone, but this compd. is unreported in the literature. — C̄ with toluene (1:7405) + $AlCl_3$ gives (80% yield (5)) *n*-undecyl *p*-tolyl ketone, m.p. 32°, b.p. 196–197° at 12 mm.(?)]

[C̄ with MeOH presumably gives methyl *n*-undecylate [Beil. II_1-(154), II_2-(314)], b.p. 123° at 9–10 mm. (6); similarly, C̄ with EtOH presumably gives ethyl *n*-undecylate [Beil. II-358, II_1-(154)] (known in polymorphic forms for which see (7) (8) (9)); note, however, that prepn. of these esters by this means is not actually reported in the literature).]

[C̄ with phenol presumably gives phenyl *n*-undecylate, but neither this cpd. nor either of the *n*-undecyl hydroxyphenyl ketones to be expected from its rearr. with $AlCl_3$ is reported in the literature. — However, for reaction of C̄ with hydroquinone (1:1590) see (10).]

[C̄ with sodium undecylate on htg. presumably gives undecylic anhydride, m.p. 36.7° (11), 35° (12), but this cpd. is actually reported only by other methods (11) (12).]

[For reaction of C̄ with diethyl sodioacetosuccinate [Beil. III-801, III_1-(280), III_2-(486)] and subsequent hydrolysis of prod to γ-ketomyristic acid see (4).]

[C̄ with vanillylamine (4-hydroxy-3-methoxybenzylamine) gives (2) cf. (13) *N*-(vanillyl)-myristamide, α-form, m.p. 69.5° (2); β-form, m.p. 62.0–62.5° (2); the m.p. of 54–56° reported earlier (13) may have been a mixture, but that of 73–74° by other workers (14) is unexplained.]

C̄ on hydrolysis yields undecylic acid (1:0573), m.p. 29.3°; for the amide, anilide, *p*-toluidide, and other derivatives corresp. to C̄ see undecylic acid (1:0573).

	148–155°	at 0.5 mm.	(3)

[For prepn. of C̄ from α-naphthylacetic acid (1:0728) with PCl_5 (4) (1), or with $SOCl_2$ alone (2) (5) or in C_6H_6 (6), see indic. refs.]

C̄ with $AlCl_3$ in nitrobenzene (1) (but *not* by $SnCl_4$ in CS_2 at room temp. (2)) losses HCl and ring-closes yielding acenaphthenone (1:5200), m.p. 121° cor.

[C̄ with aminoacetic acid (glycine) yields (5) *N*-(α-naphthylacetyl) glycine, m p. 153–154° (5). (For reactn. of C̄ with other amino acids and use as plant hormone see (5)).]

C̄ on hydrolysis yields α-naphthylacetic acid (1:0728) q.v. for the corresp. amide and anilide.

$\bar{C}$ is widely used as anti-moth agent and vapor fumigant but lit. and patents are so numerous that they cannot be included here; note, however, prevention of caking of $\bar{C}$ by mixt. with 1–10% paraformaldehyde (43). — [For study of toxicity of $\bar{C}$ see (44). — For use of $\bar{C}$ in prepn. of sulfur dyes see (45).]

[For detn. of $\bar{C}$ in air see (46); for detn. of $\bar{C}$ in soil by means of detn. of refractive index of solns. in kerosene see (47).]

[For prepn. of $\bar{C}$ from *p*-chloroaniline [Beil. XII-607, XII_1-(304)] via diazotization, prepn. of diazonium/$ZnCl_2$ double salt, and decompn. of latter in molten phenol (41% yield $\bar{C}$ together with 31% hydroxybiphenyl + 15% diphenyl ether) see (48); from *p*-phenylenediamine [Beil. XIII-61, $XIII_1$-(18)] via tetrazotization in AcOH (49) or H_3PO_4 (50) with nitrosylsulfuric acid followed by subsequent reactn. with Cu_2Cl_2 (yield: 70% (49) (50)) cf. (51), or by reduction with $SnCl_2$/HCl to *p*-phenylenedihydrazine and oxidn. with $CuSO_4$ (52), see indic. refs.]

[For prepn. of $\bar{C}$ from *p*-chloro-nitrobenzene [Beil. V-243, V_1-(130)] with conc. HCl in s.t. at 270° (53), or with $SOCl_2$ in s.t. at 160–200° (54) (55), see indic. refs.; from *p*-bromonitrobenzene [Beil. V-248, V_1-(132)] (56), phenol-*p*-sulfonic acid [Beil. XI-241, XI_1-(55)] (57), or *p*-chlorophenol (3:0475) (16) with PCl_5 on htg. see indic. refs; from *p*-chlorobenzenesulfonic acid [Beil. XI-54, XI_1-(14)] with $SOCl_2$ in s.t. at 160–200° see (54) (55); from 2,5-dichlorobenzophenone (3:2340) by fusion with KOH/NaOH (65% yield) see (58); from di-*p*-chlorophenyl sulfide or di-*p*-chlorophenyl sulfoxide with S at 260–270° for 3–8 hrs. see (59); from *p*-chlorophenyl selenium trichloride by htg. at 184° (90% yield) see (12).]

[For formn. of $\bar{C}$ (together with *o*- and *m*-isomers in some cases) from C_6H_6 with Cl_2 in pres. of I_2 (15), $MoCl_5$ (60), $AlCl_3$ (61), or conc. H_2SO_4 (62), by electrolysis of susp. in AcOH + aq. HCl (69) or with aqua regia (70), see indic. refs.; from chlorobenzene (3:7903) with Cl_2 + cat. at 600° (17) cf. (63), or with Cl_2 in pres. of $AlCl_3$ (65% yield (27)), $FeCl_3$ (55% yield (27)), or Al/Hg (66), see indic. refs; from chlorobenzene (3:7903) with $Al_2S_2Cl_8$ (i.e., $2AlCl_3 + S_2Cl_2$ (64)) + SO_2Cl_2 (64) (65), or by boilg. with $FeCl_3$ (67), or in small amt. by htg. with $PbCl_4 \cdot 2NH_4Cl$ in s.t. at 210° (68), see indic. refs.]

[$\bar{C}$ with Cl_2 (61) in pres. of Al/Hg (66) or $\bar{C}$ with $Al_2S_2Cl_8$ (i.e., $2AlCl_3 + S_2Cl_2$) + SO_2Cl_2 (64) gives (58% yield (64)) 1,2,4-trichlorobenzene (3:6420); $\bar{C}$, however, chlorinates *less* readily than *o*-dichlorobenzene (3:6055), and if their mixture or eutectic is chlorinated residual $\bar{C}$ can be separated by fractional freezing (71) (72) (73). — $\bar{C}$ with Cl_2 in pres. of Fe (74) or with $Al_2S_2Cl_8$ (i.e., $2AlCl_3 + S_2Cl_2$) + SO_2Cl_2 as directed (64) gives (yields: 67% (64), 39% (74)) (75) 1,2,4,5-tetrachlorobenzene (3:4115). — $\bar{C}$ with liq. Cl_2 + sunlight + cat. (76) (77) or $\bar{C}$ in CCl_4 under 1% aq. NaOH in sunlight (76) adds $3Cl_2$ yielding a mixt. of β- (m.p. 262° (76)) and α- (m.p. 89.6° (76)) *p*-dichlorobenzene hexachlorides (use as insecticide (77)). — For study of photochem. chlorination of $\bar{C}$ see (78).]

[$\bar{C}$ when pure can be recovered unchanged after boiling with liq. Br_2 (79); however, $\bar{C}$ warmed with Br_2 in pres. of Fe (79) or htd. with Br_2 + $NaNO_2$ + fumg. H_2SO_4 in s.t. at 200° for 4 hrs. (80) gives (19% yield (79)) 2,5-dibromo-1,4-dichlorobenzene, ndls. from hot alc., m.p. 148° (79), 146° (80). — $\bar{C}$ with excess Br_2 + $AlCl_3$ as directed (81) gives 2,3,5,6-tetrabromo-1,4-dichlorobenzene, m.p. 278–278.5° (81).]

[$\bar{C}$ passed over Pt spiral at bright red heat yields (82) 2,5,2',5'-tetrachlorobiphenyl, m.p. 84–85° (82). — $\bar{C}$ in EtOH at 55° in pres. of Adams' cat. (PtO_2) with excess H_2 at 3 atm. press. yields (83) cyclohexane (1:8405). — $\bar{C}$ in alc. KCN with $NiCl_2$ htd. in s.t. 20 hrs. at 260–270° gives (12% yield (84)) terephthalic acid (1:0910).]

[$\bar{C}$ with Na + *n*-butyl chloride (3:7160) in xylene at 150° gives small yield (85) *p*-di-*n*-butylbenzene, b.p. 224–225.5° at 759 mm. (85). — $\bar{C}$ with Mg + I_2 (0.25 equiv.) gives in 6 hrs. 58% yield (86) *p*-chlorophenyl MgCl.]

C̄ has also been much employed in the prepn. of mixed glycerides, but this topic cannot be expanded in detail in this text.

With phenols. C̄ on htg. with phenols splits out HCl yielding the corresp. esters. [E g, *C̄ with phenol (1:1420) gives (6) phenyl laurate, m.p. 24.5° (6), b.p. 210° at 15 mm. (6),* 159–161° at 1 mm. (35); C̄ with *p*-cresol (1:1410) gives (6) *p*-tolyl laurate, m p. 28° (6), b.p. 219.5° at 15 mm. (6). — C̄ (2 moles) with pyrocatechol (1:1520) at 110° for 2 hrs. gives (36) pyrocatechol dilaurate, m.p. 35.5°; C̄ (2 moles) with resorcinol (1:1530) at 110° for 2 hrs. gives (36) resorcinol dilaurate, m.p. 43–44.5°; C̄ (2 moles) with hydroquinone (1:1590) at 110° for 2 hrs. gives (36) hydroquinone dilaurate, m.p. 85–86°.]

[C̄ with phenol (1:1420) + $AlCl_3$ in *sym.*-tetrachloroethane (3:5750) as solvent, however, gives (37) (35) (38) a mixt. of the corresp. hydroxylaurophenones; viz., 32 6% yield (37) *o*-hydroxyphenyl undecyl ketone, m.p. 44–45.5° (corresp. 2,4-dinitrophenylhydrazone, m.p. 92–93°) and 24.6% yield (37) *p*-hydroxyphenyl undecyl ketone, m.p. 71–72° (corresp. 2,4-dinitrophenylhydrazone, m.p. 150–151°); for study of influence upon *o*/*p* ratio of use of nitrobenzene and CS_2 as solvents see (38); for prepn. of these hydroxylaurophenones from phenyl laurate by BF_3 rearr. see (39); for their methyl ethers see (44).]

With salts of organic acids. [C̄ with Na laurate at 100° with protection from moist air gives (40) lauric anhydride (1:0601), m.p. 44° (41), 42.1° (42), 41.8° (43), 41° (40), but the latter is usually prepd. from lauric acid (1:0605) by htg. with Ac_2O (41) (42) (43)]

With Grignard reagents. C̄ with RMgX reagents derived from tertiary halides not only undergoes the normal reaction to give the corresp. secondary alcohol but also suffers reduction [e.g., C̄ with *ter*-BuMgCl gives (7) the expected 2,2-dimethyltetradecanol-3 (67% yield) together with lauryl alc. (1:5900) (13.7%) and *ter*-butyl-undecyl-carbinyl laurate (10.4%); similarly, C̄ with *ter*-AmMgCl gives (7) lauryl alc. (1:5900) (54.8%) *and 3,3-dimethylpentadecanol-4 (17.7%)].*

With organic amines. C̄ with organic pr [illegible] C̄ with *p*-cymidine (2-methyl-5-isopropylar [illegible] anilide, m.p. 82–83°; C̄ with vanillylamine [illegible] *N*-(vanillyl)lauramide, *α*-form, m.p. 72.5–73°, *β*-form, m.p. 67–67.5°].

C̄ on hydrolysis yields lauric acid (1:0605), m p. 43–44°; for the amide, anilide, *p*-toluidide, and other derivatives corresp. to C̄ see lauric acid (1:0605).

Note that care must be taken to avoid confusion of $\bar{C}$ with n-lauryl chloride (1-chlorododecane) (3:8810).

PREPARATION OF $\bar{C}$

[For prepn. of $\bar{C}$ from n-lauric acid (1:0605) with PCl_5 (yields: 91.5% (10), 66% (13)) (6) (15) (32), with $PCl_5 + ZnCl_2$ (45% yield (13)), with PCl_3 (yields: 80% (8), 72% (13)) (4) (16), with $PCl_3 + ZnCl_2$ (79% yield (13)), with $SOCl_2$ (yields: 92% (9), 80–84% (11), 83% (13), 80% (20)) (1) (5) (17) (32) (33), with oxalyl (di)chloride (3:5060) (99% yield (3)) (2), or with carbonyl chloride (phosgene) (3:5000) at 140–150° (85–90% yield (18)) see indic. refs.]

[For prepn. of $\bar{C}$ from α,β-dichloroethyl laurate (19) on distn. with 0.1% $ZnCl_2$ (chloroacetaldehyde (3:7212) is also formed) see (19).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Behavior with Inorganic Reactants

Hydrogenation of $\bar{C}$. [$\bar{C}$ with H_2 + Pt cat. at 200–320° and 50–180 mm. or with H_2 + Raney Ni at 160° and 50 mm. *fails* (8) to give the expected lauraldehyde (1:0017); this result is apparently due to side reactions of the latter since undecane (1:8820) and tricosane, $C_{23}H_{48}$, were isolated (8).]

Behavior with sodium. [$\bar{C}$ (1 mole) with metallic sodium (1.2 moles) in dry ether refluxed (with stirring) for 4 hrs. gives (60% yield (20)) tetracosen-12-diol-12,13 dilaurate, i e., the dilaurate ester of $CH_3.(CH_2)_{10}.C(OH){=}C(OH)\,(CH_2)_{10}.CH_3$, cryst. from acetone/$C_6H_6$ (3:1), m.p. 42–43° (20)]

Behavior with Na_2O_2. [$\bar{C}$ with aq. Na_2O_2 below 50° gives (21) dilauroyl peroxide, but no constants for either this prod. or for lauroyl hydrogen peroxide can be found in the literature; for use of dilauroyl peroxide as cat. for drying oils see (22).]

Behavior with NaN_3. [*$\bar{C}$ with NaN_3 in C_6H_6 reacts to give lauroyl azide (not isolated* (23)), which loses N_2 and rearr. giving (81–86% yield (23)) undecyl isocyanate, b p. 103° at 3 mm. (23).]

Behavior with Organic Reactants

With hydrocarbons. [$\bar{C}$ with $C_6H_6 + AlCl_3$ gives (yields· 100% (14), 71% (11)) (24) (25) (26) (27) phenyl undecyl ketone (laurophenone) [Beil. VII-345, VII₁-(186)], m p. 47° (24) (28), 46° (14) (25), 45° (26), 44–45° (11); b.p. 222–223° at 21 mm. (25), 201–202° at 9 mm. (26), 193–194° at 9 mm. (11), 174° at 3 mm. (29) (corresp. oxime, m.p. 64.5° (11); semicarbazone, m.p. 98° (11); 2,4-dinitrophenylhydrazone, m.p. 101–102° (11)). — For analogous reactions of $\bar{C}$ in pres. of $AlCl_3$ with biphenyl (1:7175), diphenyl ether (1:7125), diphenylene oxide (1:7205), carbazole, thiophene, and furan see (30); for use of these products as waxes, addition agents for lubricants, etc., see (30) (31).]

With alcohols. $\bar{C}$ with alcohols gives in general the corresp. alkyl laurates [e g., $\bar{C}$ with MeOH gives methyl laurate, m p. +5°, b.p 148° at 18 mm. (10); $\bar{C}$ with EtOH gives ethyl laurate (1:4196), m p. −1.7 b p. 269°; etc. — $\bar{C}$ with benzyl alc. (1:6480) gives (32) benzyl laurate; $\bar{C}$ with menthol (1:5940) gives (33) menthyl laurate; etc.].

$\bar{C}$ (2 moles) with dihydric alcs. on htg. gives the corresp. neutral esters [e.g., $\bar{C}$ with ethylene glycol (1:6465) gives (34) ethylene glycol dilaurate (1:2157), m p. 52°; $\bar{C}$ with propanediol-1,2 (1:6455) gives (34) propylene glycol dilaurate, m p 35°; $\bar{C}$ with butanediol-1,3 (1:6482) gives (34) 1,3-butylene glycol dilaurate, m p. about 16.5°; $\bar{C}$ with butanediol-1,4 (1:6516) gives (34) tetramethylene glycol dilaurate, m.p. 45.5°].

[For prepn. of C̄ from *m*-chlorobromobenzene [Beil. V-209, V_1-(115), V_2-(161)] (2) by conversion to *m*-chlorophenyl MgBr (cf. (3)) and reaction with *o*-chlorobenzonitrile [Beil. IX-336] (4) (5) followed by hydrolysis (73% yield) see (1).]

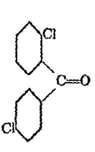
—— **2,4′-DICHLOROBENZOPHENONE** $C_{13}H_8OCl_2$ **Beil. VII - 420**
VII_1—



B.P. 214–215° at 22 mm. **M.P. 66–67°**

See 3:1565. *Division A: Solids.*

3:9859-A 2,3′-DICHLOROBENZOPHENONE $C_{13}H_8OCl_2$ **Beil. S.N. 652**
(*o*-Chlorophenyl *m*-chlorophenyl ketone)

B.P. 140–142° at 1 mm. (1)

Oil, which on attempted distillation dec. (1) (2) into HCl + 1,2-diphenylethylene (stilbene) (1:7250). — $\bar{C}$ can, however, be distilled with steam (1).

[For prepn. of $\bar{C}$ from C_6H_6 with chloroacetaldehyde (3:7212) (generated in mixt. by use of α,β-dichloroethyl ethyl ether (3:5640)) + conc. H_2SO_4 see (2); for formn. in very small amt. from 1,1,1-trichloro-2,2-diphenylethane [Beil. VI-606, VI_1-(285)] during electrolytic reduction in alc./HCl see (3).]

$\bar{C}$ with alc. KOH loses HCl yielding (1) 1,1-diphenylethylene [Beil. V-639, V_1-(308), V_2-(543)], b.p. 277°, accompanied by its polymers.

3:9871 (1) Hepp, *Ber.* **7**, 1409–1413 (1874). (2) Hepp, *Ber.* **6**, 1439 (1873). (3) Brand, *Z. Elektrochem.* **16**, 670 (1910).

3:9874 1-CHLOROTETRADECANE $C_{14}H_{29}Cl$ Beil. I —
(*n*-Tetradecyl chloride; $CH_3.(CH_2)_{12}\,CH_2Cl$ I_1—
n-myristyl chloride) I_2-(135)

B.P. 154–155° at 15 mm. (1) D_4^{20} **= 0.8589 (2)** n_D^{20} **= 1.4450 (2)**
139–142° at 4 mm. (2)
44–53° at 2 × 10^{-4} mm. (2)

Care must be taken to avoid confusion of $\bar{C}$ with the acid chloride of *n*-tetradecanoic acid (myristic acid), commonly designated as *n*-myristoyl chloride (3:9885).

[For prepn. of $\bar{C}$ from tetradecanol-1 (1:5935) with conc. HCl + $ZnCl_2$ or by htg. in s.t. with fumg. HCl see (1); for formn of $\bar{C}$ (31% yield) from tetradecanol-1 (1:5935) with PCl_3 in pres. of mesityl oxide and Ac_2O see (2).]

[$\bar{C}$ (1 mole) with pyridine (1 mole) in s.t. at 110° for 15 hrs. gives (3) the corresp. quaternary salt, viz., *N*-(*n*-tetradecyl)pyridinium chloride, cryst. from alc./ether or from C_6H_6 as monohydrate, m p. 85.5° (3), 75 5° (5) (this prod. on cat. hydrogenation gives (3) *N*-(*n*-tetradecyl)piperidinium hydrochloride, m.p. 186–187° (3). — For analogous reactn. of $\bar{C}$ with isoquinoline see (3)]

[For study of rate of reactn. of $\bar{C}$ with KI in acetone at 50° and 60° see (1).]

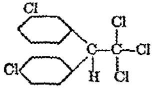
—— *n*-Tetradecyl *p*-nitrobenzoate: m p. 51 2° cor. (4). [Prepd. indirectly.]
—— *n*-Tetradecyl 3,5-dinitrobenzoate: unreported.
—— *N*-(*n*-Tetradecyl)phthalimide: unreported.
—— *S*-(*n*-Tetradecyl)isothiourea picrate: unreported.
—— *n*-Tetradecyl mercuric chloride: unreported (but see (6)).

3:9874 (1) Conant, Hussey, *J Am. Chem. Soc.* **47**, 483, 485 (1925). (2) Drake, Marvel, *J. Org. Chem.* **2**, 394 (1937). (3) Karrer, Kahnt, Epstein, Jaffé, Ishii, *Helv. Chim. Acta* **21**, 233–234 (1938). (4) Armstrong, Copenhaver, *J. Am. Chem. Soc.* **65**, 2252–2253 (1943). (5) Lottermoser, Froscher, *Kolloid-Beihefte* **45**, 305–306, 315, 319, 323, 339 (1937). (6) Meals, *J. Org. Chem* **9**, 215 (1944).

This compound is the so-called *o,o'*-isomer of "DDT" (3:3298). Although it is known to be a contaminant of "DDT" (e.g., 6% (1)) no accurate information regarding it is at present available.

3:9865 (1) Gunther, *J. Chem. Education* 22, 239 (1945).

3:9867 1,1,1-TRICHLORO-2-(*m*-CHLOROPHENYL)-2-(*p*-CHLOROPHENYL)ETHANE $C_{14}H_9Cl_5$ **Beil. S.N. 479**
("*m,p'*-DDT")



B.P. 181–185° at 1 mm. (1)

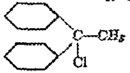
[For prepn. of $\bar{C}$ from 2,2,2-trichloro-1-(*m*-chlorophenyl)ethanol (1) by condensation with chlorobenzene (3:7903) in presence of fumg. H_2SO_4 (48% yield) see (1).]

[$\bar{C}$ with alc. KOH loses HCl giving (80% yield (1)) 1,1-dichloro-2-(*m*-chlorophenyl)-2-(*p*-chlorophenyl)ethylene (3:9863).]

$\bar{C}$ on dinitration with equal wt. fumg HNO_3 gives (90% yield (1)) a dinitro cpd., m.p. 118.8–120.1° (1).

3:9867 (1) Haller, Bartlett, Drake, Newman, Cristol, *J. Am. Chem Soc.* 67, 1600 (1945).

3:9870 1,1-DIPHENYLETHYL CHLORIDE $C_{14}H_{13}Cl$ **Beil. S.N. 479**
(Chloro-diphenyl-methyl-methane)



[*See also* 2,2-*diphenylethyl chloride* (3:9871).]

$\bar{C}$ cannot be obtd. in cryst form; at room temp. $\bar{C}$ slowly dec. (1) to give HCl and 1,1-diphenylethylene [Beil V-639, V_1-(308), V_2-(543)], b p. 277°, accompanied (1) (3) by a small amt. of 1,1,3,3-tetraphenylbutene-1, m p. 113–114° (the unsatd. dimer of 1,1-diphenylethylene).

[For prepn. of $\bar{C}$ from diphenyl-methyl-carbinol [Beil. VI-685, VI_1-(330)] in C_6H_6 (1) or pet. ether (2) in pres. of $CaCl_2$ by saturation at 0–10° with dry HCl gas and stdg overnight see indic. refs.]

$\bar{C}$ in C_6H_6 stood at room temp. gives (95–97% yield in 1 week, 80% in 1 day (1)) 1,1,3-triphenyl-3-methylhydrindene (the saturated dimer of 1,1-diphenylethylene), colorless cryst. from alc, m p. 143° (1); note that attempts to accelerate this reaction by warming give decreased yield together with formation of 1,1-diphenylethylene and its unsaturated dimer (mentioned above).

	119.5–123°	at 1 mm.	(11)	

Care must be taken to avoid confusion of C̄ with *n*-myristyl chloride (1-chlorotetradecane) (3:9874).

PREPARATION OF C̄

[For prepn. of C̄ from myristic acid (1:0630) with $SOCl_2$ (yields: 91% (8), 80% (3), 80–84% (9), 79% (6)) (12) (2) (13) (14) (15); with PCl_5 (89% yield (6)) (7) (14); with PCl_3 (11) (1) (17); with $PCl_3 + ZnCl_2$ (79% yield (6)); or with oxalyl (di)chloride (3:5060) (10) see indic. refs.]

CHEMICAL BEHAVIOR OF C̄

Behavior with Inorganic Reactants

Hydrogenation of C̄. [C̄ with H_2 + Pt cat. at 220–230° at 60–65 mm. gives (1) not only some *n*-myristaldehyde (1:0004) and its trimer but also (by loss of CO from C̄) *n*-tridecane [Beil. 1-171, I$_2$-(134)], b.p. 234°.]

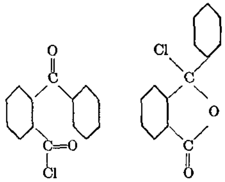
Hydrolysis of C̄. C̄ on hydrolysis with aq. presumably yields myristic acid (1:0630) + HCl although actual record of this reaction is lacking in the literature.

Behavior with sodium. [C̄ (1 mole) with metallic sodium (1.2 moles) in dry ether refluxed (with stirring) for 10 hrs. gives (64% yield (3)) octacosen-14-diol-14,15 dimyristate, i.e., the dimyristate ester of $CH_3.(CH_2)_{12}.C(OH){=}C(OH).(CH_2)_{12}.CH_3$, cryst. from acetone/$C_6H_6$ (3:1), m.p 54–55° (3).]

Behavior with Organic Reactants

With hydrocarbons (or their equivalents). [C̄ with $C_6H_6 + AlCl_3$ in CS_2 gives (69% yield (9)) phenyl *n*-tridecyl ketone (myristophenone) [Beil. VII$_1$-(186)], m.p. 52–53°

3:9880 *o*-BENZOYLBENZOYL CHLORIDE=A $C_{14}H_9O_2Cl$ A. Beil. X-749
3-CHLORO-3-PHENYLPHTHALIDE=B X_1—
(*o*-Benzoylbenzoyl *pseudo*-chloride) B. Beil. XVII-361
$XVII_1$—



A B

C̄ appears to react in two tautomeric forms corresp to structures A and B, the independent existence of which, however, has not (as yet) been definitely established. The same method of prepn. has in various laboratories given results sometimes suggesting a preponderance of A, sometimes of the tautomer B. The constants reported for C̄ show a correspondingly wide variation, e g., m p. 82–83° (1), abt. 70° (2), 59–60° (3), b p. 170–171° at 1 mm. (1); other workers, e.g. (5) (6), have sometimes obtd. C̄ in crystn form and sometimes not and have failed to report constants

[For prepn. of C̄ from *o*-benzoylbenzoic acid (1·0720) with PCl_5 in CS_2 (2) (3) (4) (5), or PCl_5 (7), PCl_3 (7) (4), or $SOCl_2$ (7) (4) (5) (6) (1) (8) (11), see indic. refs.; for prepn of C̄ from 3-phenylphthalide with Cl_2 at 115–120° see (5)]

C̄-A on htg. above 130° loses HCl and ring-closes yielding (9) (10) anthraquinone (1:9095).

C̄-A with conc. aq NH_4OH at 0° yields (9) *o*-benzoylbenzamide, m p 165° cor. (9), with aniline yields (11) *o*-benzoylbenzanilide, m p 195° (11).

C̄-A with MeOH yields (2) (7) (4) methyl *o*-benzoylbenzoate, m p 51 5° (4), 51 7° (4), 51–52° (2), 52° (12); C̄-B with MeOH yields (7) methyl *pseudo*-*o*-benzoylbenzoate (3-methoxy-3-phenylphthalide), m p 80–81° (7)

C̄-A with EtOH should yield ethyl *o*-benzoylbenzoate, m p. 58° (13) (12); C̄-B with EtOH yields (14) ethyl *pseudo*-*o*-benzoylbenzoate (3-ethoxy-3-phenylphthalide), m p. 51–53° (14), 56° (13).

C̄-A with K phenolate or with phenol in pyridine yields (5) phenyl *o*-benzoylbenzoate, m p. 162–163° (5), C̄-B under same circumstances yields phenyl *pseudo*-*o*-benzoylbenzoate (3-phenoxy-3-phenylphthalide), m.p. 80–82° (5). [For analogous behavior of other phenols see (5).]

C̄-B with phenol yields (6) 3-(*p*-hydroxyphenyl)-3-phenylphthalide, m p. 168–170° (6). [For analogous reactn. with other phenols and phenol ethers see (6)]

[For reactn. of C̄ with α-methylnaphthalene see (15).]

(corresp. oxime, m.p. 69.5°; corresp. 2,4-dinitrophenylhydrazone, m.p. 98.0–98.5°; corresp. semicarbazone, m.p. 101° (9)).]

[C̄ with thiophene + $SnCl_4$ gives (yield not stated (18)) 2-furyl *n*-tridecyl ketone (2-myristolythiophene), oil, b.p. 205–210° at 4 mm., $D_{25}^{25} = 0.9506$, $n_D^{25} = 1.4961$ (18).]

[C̄ with carbazole + $AlCl_3$ gives (yield not stated (18)) 2,8-dimyristolylcarbazole, m.p. 169° (18).]

With alcohols. C̄ with alcohols gives in general the corresp. alkyl myristates. [E g , C̄ with MeOH gives methyl myristate (1:2013), m.p. 18.5°; C̄ with EtOH gives ethyl myristate (1:4316), m.p. 11.9°, b p. 295°; etc. — C̄ with benzyl alc. (1:6480) gives (14) benzyl myristate; C̄ with menthol (1:5940) gives (15) menthyl myristate; etc.]

C̄ (2 moles) with dihydric alcs. on htg. gives the corresp. neutral esters [e.g., C̄ with ethylene glycol (1:6465) gives (20) ethylene glycol dimyristate (1:2233), m.p. 63°; C̄ with propanediol-1,2 (1:6455) gives (20) propylene glycol dimyristate, m p. 41.5°; C̄ with butanediol-1,3 (1:6482) gives (20) 1,3-butylene glycol dimyristate, m.p. 29.5–31.0°; C̄ with butanediol-1,4 (1:6516) gives (20) tetramethyleneglycol dimyristate, m.p. 55°].

C̄ has been much employed in prepn. of mixed glycerides, but this topic cannot be expanded in detail in this text [however, for examples of use of C̄ with the compound of glycerol + acetone (i.e., 4-hydroxymethyl-2,2-dimethyldioxolane-1,3) in prepn. of glyceryl α-monomyristate ("α-monomyristin") see (10) (5)].

With phenols. C̄ on htg. with phenols splits out HCl yielding the corresp. esters [e g , C̄ with phenol (1:1420) on htg. gives (7) phenyl myristate, m.p. 36°, b.p. 230° cor. at 15 mm. (7); C̄ with *p*-cresol (1:1410) on htg. gives (7) *p*-tolyl myristate, m.p. 39°, b.p. 239.5° at 15 mm. (7); C̄ (2 moles) with pyrocatechol (1:1520) at 110° for 2 hrs. gives (12) pyrocatechol dimyristate, m p. 47–48°; C̄ (2 moles) with resorcinol (1:1530) at 110° for 2 hrs. gives (12) resorcinol dimyristate, m.p. 53°; C̄ (2 moles) with hydroquinone (1:1590) at 110° for 2 hrs. gives (12) hydroquinone dimyristate, m.p. 90–90.3°].

[C̄ with phenol (1:1420) + $AlCl_3$ in *sym.*-tetrachloroethane (3:5750) as solvent, however, gives (11) a mixt. of the corresp. hydroxymyristophenones: viz., 31.9% yield (11) *o*-hydroxyphenyl *n*-tridecyl ketone, m.p. 52–55° (corresp. 2,4-dinitrophenylhydrazone, m.p. 92.0–92.5°) and 36.7% yield (11) *p*-hydroxphenyl *n*-tridecyl ketone, m.p. 78–80° (corresp. 2,4-dinitrophenylhydrazone, m.p. 142–143°); for prepn. of these same products by direct rearr. of phenyl myristate (above) with $AlCl_3$ in *sym.*-tetrachloroethane soln. see (19).]

With salts of organic acids. [C̄ with sodium myristate at 100° in absence of air gives (21) myristic anhydride (1:0629), m.p. 53.5° (22), 53 4° (23), 51° (21).]

With organometallic compounds. [C̄ with ethyl sodioacetoacetate gives (60% yield (13)) ethyl α-myristoylacetoacetate, b.p. 170–183° at 3 mm.; this prod. with NH_3 gas splits off the aceto group yielding (13) ethyl myristoylacetate, m.p. 36–37°, b.p. 187–188° at 7 mm.]

With organic amines [illegible]

C̄ with *p*-cymidine

anilide, m p. 88–89

N-(vanillyl)myristamide, α-form, m p. 82°, β-form, m p. 76 5–77°].

C̄ on hydrolysis yields myristic acid (1:0630), m.p. 53 86°; for the amide, anilide, *p*-toluidide, and other derivatives corresp. to C̄ see myristic acid (1:0630).

[$\bar{C}$ with ethylene + $AlCl_3$ gives a mixt. (87) of mono-, di-, tri-, and tetra-ethyl-*p*-dichlorobenzenes.]

[$\bar{C}$ (3 moles) with $CHCl_3$ (1 mole) + $AlCl_3$ gives (14% yield (88)) *tris*-(2,5-dichlorophenyl)methane, colorless cryst. from C_6H_6, m.p. 206–208° (88). — $\bar{C}$ with CCl_4 + $AlCl_3$ at room temp. (88) or in CS_2 (89) (90) gives (26% yield (88)) 2,5,2',5'-tetrachlorobenzophenone dichloride, m.p 173–174° (89) (88); this with dil. alc. on boilg. or htg. in s.t. at 130° hydrolyzes to 2,5,2',5'-tetrachlorobenzophenone, colorless cryst. from alc., m.p. 128° (89) (90). — $\bar{C}$ with CCl_4 + $AlCl_3$ at 55° for 10 hrs. presumably first yields *tris*-(2,5-dichlorophenyl)methyl chloride (not isolated) which then loses 1 HCl giving (23% yield (88)) 1,4,7-trichloro-9-(2,5-dichlorophenyl)fluorene (?), m.p. 179–180° (88).]

[$\bar{C}$ with acetyl chloride (3:7065) + $AlCl_3$ gives (91) 2,5-dichloroacetophenone, b.p. 251° at 756 mm., m.p. 14° (91) (oxime, m.p. 130°, via Beckmann rearr. with conc. H_2SO_4 gives acet-2,5-dichloroanilide, m.p. 133° (91)). — $\bar{C}$ with benzoyl chloride (3:6240) + $AlCl_3$ yields (91) (92) 2,5-dichlorobenzophenone, white ndls. from alc., m.p. 88° (91), 85–86° (92) (oxime, m.p. on slow htg. 207°, via Beckmann rearr. with conc. H_2SO_4 gives benz-2,5-*dichloroanilide, m.p. 122° (91)). — $\bar{C}$ with o-chlorobenzoyl chloride (3:6640) + $AlCl_3$* gives (92) 2,2',5-trichlorobenzophenone, m.p. 145–147° (92). — $\bar{C}$ with 2,4-dichlorobenzoyl chloride + $AlCl_3$ gives 2,5,2',4'-tetrachlorobenzophenone, m.p. 176° (92).] — [Note that $\bar{C}$ fails to react with *sym*-dichlorodimethyl ether (3:5245).]

[$\bar{C}$ with phthalic anhydride (1:0725) + $AlCl_3$ gives (59.3% (94), 27% (93)) *o*-(2,5-dichlorobenzoyl)benzoic acid, colorless pr. from C_6H_6, m.p. 169° cor. (93), 167° (94); this prod. on ring closure with fumg. H_2SO_4 (94) or conc. H_2SO_4 (93) at 150° gives (yields: 83.5% (94), 83% (93)) 1,4-dichloroanthraquinone [Beil. VII-787, VII_1-(411)], or.-yel. ndls. from AcOH, m.p. 187.5° cor. (93), 186° (94). — Note that $\bar{C}$ reacts with phthalic anhydride + $AlCl_3$ less readily than *o*-dichlorobenzene (3:6055) (use in sepn. of the two isomers (95)). — For corresp. condens. of $\bar{C}$ with 3-sulfophthalic anhydride and 4-sulfophthalic anhydride in pres. of $AlCl_3$ see (96).]

[$\bar{C}$ on partial hydrol. with aq. MeOH alk., alk. carbonates, or best alk. earths in pres. of Cu or Cu salts at elevated temps. under press. gives in excellent yield (98) (99) (100) (101) (102) (103) (104) (105) *p*-chlorophenol (3:0475) (some phenol (1:1420) is also formed (102)); if the hydrolysis of $\bar{C}$ is carried further (100) (106) hydroquinone (1:1590) is also obtd.] — [For study of kinetics of reactn. of $\bar{C}$ with MeOH/alk. see (99) (107) (108).]

[$\bar{C}$ with anhyd. NH_3 in alc. in pres. of $CuCl_2$ + Cu under press. at 150–200° yields (109) *p*-chloroaniline [Beil. XII-607, XII_1-(304)]; $\bar{C}$ with conc. aq. NH_4OH in pres. of CuO under press. at 150–200° gives (110) (111) (112) (113) (114) *p*-phenylenediamine [Beil. XIII-61, $XIII_1$-(18)]. — [$\bar{C}$ with K diphenylamine at 240–245° gives (115) not only the expected *N,N,N',N'*-tetraphenyl-*p*-phenylenediamine, tbls. from acetone, m.p. 199–200°, but also by rearr. *N,N,N',N'*-tetraphenyl-*m*-phenylenediamine, m.p. 137.5–138°.]

[$\bar{C}$ on mononitration, e.g., with 5 wt. pts. abs. HNO_3 at 0° (116) (99), with 2 wt pts. HNO_3 (D = 1.48) below 50° (120), or with 1.5 pts. of a mixt. contg. 2 pts. HNO_3 (D = 1.54) + 3 pts. conc. H_2SO_4 (117) (118) (119) at 70–100° for 30–60 min., yields 1,4-dichloro-2-nitrobenzene [Beil. V-245, V_1-(131)], cryst. from alc , m.p. 55° (120), 54.5° (99), 54° (119), 53° (116) (note close proximity of this m.p. to that of the initial $\bar{C}$).]

[$\bar{C}$ on dinitration, e.g., with 4 wt. pts. fumg. HNO_3 (D = 1.52) + 10 wt. pts. conc. H_2SO_4 at b.p. for 5 hrs. (8) (121), or with 3 wt. pts. HNO_3 (D = 1.52) + 7.5 wt. pts. conc. H_2SO_4 at b.p. for 2 hrs. (122), finally poured into aq., gives a mixt. contg. all three possible dinitro-*p*-dichlorobenzenes; of these the chief prod. is 1,4-dichloro-2,6-dinitrobenzene [Beil. V-265, V_1-(138)], m.p. 106° (123) (119), 105–106° (122), 105° (121), obtd. by recrystn if necessary) of the crude dinitration prod. from 30 p[illegible] . (121); the contain the more soluble 1,4-dichloro-2,3-dinitrob[illegible] [illegible]–103° (122),

3:9912 *n*-HEXADECANOYL CHLORIDE $C_{16}H_{31}OCl$ Beil. II - 374
(Palmitoyl chloride) $CH_3(CH_2)_{14}C(=O)Cl$ II₁-(167) II₂-(341)

	143° at	0.3 mm.	(10)	
	155–160° at	0.2 mm.	(11)	

Note that care must be taken to avoid confusion of C̄ with palmityl chloride (1-chlorohexadecane) (3:0015).

PREPARATION OF C̄

[For prepn. of C̄ from palmitic acid (1:0650) with PCl_5 (yields: 60% (2), 49% (12)) (5) (13) (14) (15) (16), with $PCl_3 + ZnCl_2$ (72% yield (12)), with $SOCl_2$ directly (yields: 93.5% (7), 86% (12), 80% (6)) (17) (19) (45) or in CCl_4 soln. (18), or with phosgene (3:5000) at 140–155° (70–75% yield (20)) see indic. refs.)

CHEMICAL BEHAVIOR OF C̄

Behavior with Inorganic Reactants

With sodium. [C̄ (1 mole) with metallic sodium (1.2 moles) in dry ether refluxed with stirring as directed gives (70% yield (6)) dotriaconten-16-diol-16,17 dipalmitate, i e , the dipalmitate ester of $CH_3(CH_2)_{14}.C(OH){=}C(OH).(CH_2)_{14}CH_3$, cryst. from acetone/$C_6H_6$ (3:1), m.p. 61–62° (6).]

With sodium azide. [C̄ with NaN_3 in C_6H_6 gives (14) palmitoyl azide [Beil. II-375] (not isolated by (14)) which loses N_2 with rearr. to pentadecyl isocyanate [Beil. IV-202] (not isolated by (14) but from indirect prepn. reported (21) as m.p. 8–14°) [cf. corresp. behavior of lauroyl chloride (3:9858)].]

With water. C̄ with aq hydrolyzes to palmitic acid (1:0650) + HCl. [For study of rate of hydrolysis with ord. H_2O and with D_2O see (22).]

Behavior with Organic Reactants

With hydrocarbons. [C̄ with $C_6H_6 + AlCl_3$ gives (60% yield (23)) (24) (25) pentadecyl phenyl ketone (penmitophenone) [Beil. VII-347, VII₁-(186)], lfts. from alc., m.p. 59° (23) (24) (26), b p. 250 5–251.0° at 15 mm. (24) (corresp. oxime, m.p. 73–74° (26)). — C̄ with toluene + $AlCl_3$ gives (24) pentadecyl *p*-tolyl ketone [Beil. VII-347, VII₁-(186)], lfts. from alc., m p. 60° (24) (26), b p. 262° cor. at 15 mm. (24) (corresp. oxime, m p. 60° (27), semicarbazone, m p. 114.5° (26), phenylhydrazone, m p. 54–55° (26)). — For analogous behavior of C̄ + $AlCl_3$ + *m*-xylene (24), mesitylene (27) (2), diphenyl ether (28), and carbazole (28) see indic. refs.; for use of these products as waxes, addition agents for lubricants, etc., see (28) (29).]

With alcohols. $\bar{C}$ with alcohols gives in general the corresp. alkyl palmitates [e.g., $\bar{C}$ with MeOH gives methyl palmitate (1:2055), m.p. 30°; $\bar{C}$ with EtOH gives ethyl palmitate (1:2034), α-form, m.p. 19.4°, β-form, m.p. 24.2°, etc.; $\bar{C}$ with bezynl alc. (1:6480) gives (30) benzyl palmitate, m.p. 36°; $\bar{C}$ with menthol (1:5940) gives (31) menthyl palmitate, m.p. 32°].

$\bar{C}$ (2 moles) with dihydric alcs. on htg. gives the corresp. neutral esters [e.g., $\bar{C}$ with ethylene glycol (1:6465) gives (32) ethylene glycol dipalmitate (1:2269), m.p. 70.5°; $\bar{C}$ with propanediol-1,2 (1:6455) gives (32) propylene glycol dipalmitate, m.p. 52.5–54.5°; $\bar{C}$ with butanediol-1,3 (1:6482) gives (32) 1,3-butylene glycol dipalmitate, m.p. 39–40°; $\bar{C}$ with butanediol-1,4 (1:6516) gives (32) tetramethylene glycol dipalmitate, m.p. 63°].

$\bar{C}$ has also been much employed in the prepn. of mixed glycerides, but this topic cannot be expanded in detail in this text.

With phenols. $\bar{C}$ on htg. with phenols splits out HCl yielding the corresp. esters. [E.g., $\bar{C}$ with phenol (1:1420) gives (5) phenyl palmitate, m.p. 45° (5), 44.5–46.0° (33), b.p. 249.5° at 15 mm. (5); $\bar{C}$ with *p*-cresol (1:1410) gives (5) *p*-tolyl palmitate, m.p. 47°, b.p. 258° at 15 mm. — $\bar{C}$ (2 moles) with pyrocatechol (1:1520) at 110° for 2 hrs gives (34) pyrocatechol dipalmitate, m.p. 58°; $\bar{C}$ (2 moles) with resorcinol (1:1530) at 110° for 2 hrs. gives (34) resorcinol dipalmitate, m.p. 62.5–63.5°; $\bar{C}$ (2 moles) with hydroquinone (1:1590) at 110° for 2 hrs. gives (34) hydroquinone dipalmitate, m.p. 94.5°.]

[$\bar{C}$ with phenol (1:1420) + $AlCl_3$ in *sym.*-tetrachloroethane (3:5750) as solvent, however, gives (35) (33) (36) a mixt. of the corresp. hydroxypalmitophenones; viz., 25.4% yield *o*-hydroxyphenyl pentadecyl ketone, m.p. 54–56° (corresp. 2,4-dinitrophenylhydrazone, m.p. 94–95° (35)), and 28.5% yield *p*-hydroxyphenyl pentadecyl ketone, m.p. 84.5–85° (35), 78° (37) (corresp. 2,4-dinitrophenylhydrazone, m.p. 141–142° (35)); for study of influence upon *o/p* ratio of use of nitrobenzene and of CS_2 as solvents see (36).]

With salts of organic acids. [$\bar{C}$ with Ag palmitate at 100° for 10 min. (38) or $\bar{C}$ with Na$\bar{A}$ (32) (42) gives palmitic anhydride (1:0651), m.p. 64° (39), 63.9° (40), 63–64° (41), 63° (38), 62–63° (32) (43), but the latter is usually prepd. from palmitic acid (1:0650) by htg. with Ac_2O (39) (40) (41) (42) (43).]

With esters. [$\bar{C}$ with diethyl sodiomalonate would be expected to give diethyl palmitoylmalonate, but for unsuccessful attempt to realize this reaction see (44).]

[$\bar{C}$ with ethyl sodio-acetoacetate in dry ether gives (62% yield (11)) (45) ethyl α-palmitoylacetoacetate, m.p. 36–36.5° (11) (45); note that this prod. with aq. NaOH splits off the acetyl group giving (62% yield (11)) ethyl palmitoylacetate, m.p. 37–38° (11) (45).]

With amines. $\bar{C}$ with org. prim. amines yields the corresp. amides [e.g., $\bar{C}$ with *p*-cymidine (2-methyl-5-isopropylaniline) gives (1) palmito-(2-methyl-5-isopropyl)anilide, m.p. 90–91°; $\bar{C}$ with vanillylamine (4-hydroxy-3-methoxybenzylamine) gives (8) *N*-(vanillyl)-palmitamide, α-form, m.p. 89–89.5°, β-form, m.p. 84–84.5°].

$\bar{C}$ on hydrolysis yields palmitic acid (1:0650), m.p. 62.7°; for the amide, anilide, *p*-toluidide, and other derivs. corresp. to $\bar{C}$ see palmitic acid (1:0650).

158–159°	at 0.05 mm.	(5)

[*See also the trans stereoisomer, viz., elaidoyl chloride* (3:9950).]

[For prepn. of C̄ from oleic acid (1:0565) with PCl_5 (yields: 75% (2), 48% (6), 27% (7)) (8), with PCl_3 (46% yield (6)) (9), with $PCl_3 + ZnCl_2$ (50% yield (7)), with $SOCl_2$ (yields: 82.5% (4), 80% (7), 75% (2)) (3), with oxalyl (di)chloride (3:5060) (90% yield (3)), or with $COCl_2$ (3:5000) (10) see indic. refs.]

Note that C̄ with oleic acid (1:0565) forms a const.-boilg. mixt., b.p. about 241° at 6 mm., contg. 40% C̄ (6).

The *reaction of C̄ as an acyl chloride with a wide variety of organic compounds* has been reported in many patents which cannot be reviewed here.

C̄ has also been employed in the course of prepn. of mixed glycerides; although this topic cannot be fully reviewed in this text, see for examples (3) (11) (12).

[For behavior of C̄ with resins derived from indene, coumarone, or dicyclopentadiene see (13).]

[C̄ with diazomethane gives an intermediate diazoketone which on decompn. with AcOH gives (75% yield (4)) nonadecen-10-one-2-yl-1 acetate, m.p. 21° (14).]

[C̄ with phenol (1:1420) at 160° for 4 hrs. gives (55% yield (18)) phenyl oleate, oil, b.p. 256–257° at 12 mm. (18).]

[C̄ with Na oleate yields (10) oleic anhydride [Beil. II-469, II_2-(441)], lfts. or scales from ether or alc., m.p. 22.2° (15), 22° (16), but the latter is usually prepared directly (15) (17) from oleic acid (1:0565).]

C̄ on hydrolysis yields oleic acid (1:0565); for the amide, anilide, *p*-toluidide, and other derivs. corresp. to C̄ see oleic acid (1:0565).

176–178°	at	0.5 mm.	(10)		
165°	at	0.4 mm.	(11)		

Note that care must be taken to avoid confusion of C̄ with stearyl chloride (1-chloro-octadecane) (3:0095).

PREPARATION OF C̄

[For prepn. of C̄ from stearic acid (1:0660) with PCl_5 directly (1) (12) (13) (21) or in CCl_4 soln. (14), with $SOCl_2$ directly (yields: 97% (10), 81% (3)) (4) (7) (15) (16) (17) or in CCl_4 soln. (yield 86% (8)) (14), with PCl_3 (18), with oxalyl (di)chloride (3:5060) (11), or with phosgene (3:5000) at 140–150° (70–75% yield (19)) see indic. refs.]

CHEMICAL BEHAVIOR OF C̄

Behavior with Inorganic Reagents

Hydrogenation of C̄. [C̄ with H_2 + $Pd/BaSO_4$ cat. in boilg. xylene gives (20) (21) stearaldehyde (1:0012).]

Behavior with bromine. [For behavior of C̄ with Br_2 at room temp., 100°, and 135° see (22).]

Behavior with sodium. [C̄ (1 mole) with metallic sodium (1.2 moles) in dry ether under reflux gives (67% yield (3)) hexatriaconten-18-diol-18,19 distearate, i.e., the distearate ester of $CH_3(CH_2)_{16}C(OH)=C(OH)(CH_2)_{16}CH_3$, m.p. 67–68°.]

With sodium azide. [C̄ with NaN_3 in C_6H_6 gives (23) (12) stearoyl azide (not isolated) which loses N_2 with rearr. giving (43% yield (23)) heptadecyl isocyanate, b.p. 208–209°

at 17 mm. (23), 200–203° at 15 mm. (24); cf. the corresp. behavior of lauroyl chloride (3:9858).]

With water. C̄ with aq. hydrolyzes to stearic acid (1:0660) + HCl.

BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons (or their equivalents). [C̄ with C_6H_6 + $AlCl_3$ gives (yields: 65% (25), 60% (26)) (27) (18) heptadecyl phenyl ketone (stearophenone) [Beil. VII-347, VII_1-(187)], lfts. from alc., m.p. 64–65° (25), 63 5–64.5° (18), 64° (28), 59° (27) (29) (corresp. oxime, m.p. 53° (27), phenylhydrazone, m.p. 54° (28)); note that in this reaction no introduction of a second acyl radical occurs (30), and that attempts to prepare stearophenone by use (with C_6H_6 + $AlCl_3$) of the mixed anhydride from stearic acid with ketene) gave very poor yields (29). — For patents on the use of stearophenone as an electric insulator (31), on its sulfonation (32), or on its reaction with PCl_3 (33) see indic. refs.]

[C̄ with toluene + $AlCl_3$ gives (34) heptadecyl *p*-tolyl-ketone [Beil. VII-347, VII_1-(187)], lfts. from alc., m.p. 67° (34), 66–67° (28), b.p. 278° cor. at 15 mm. (34) (corresp. oxime, m.p. 64° (27)). — For analogous behavior of C̄ with naphthalene (1:7200) (18), tetralin (1:7550) (18), biphenyl (1:7175) (18) (35), *p*-methylbiphenyl (35), *p*-chlorobiphenyl (3:1912) (35), diphenyl ether (1:7125) (35), *p*-nitrodiphenyl ether (35), furan (1:8015) (35), 2-methylfuran (35), dibenzofuran (35), thiophene (35), dibenzothiophene (35), carbazole (35), etc., see indic. refs.; for use of these products as waxes, addition agents for lubricants, etc., see (35) (36).]

[For behavior of C̄ with resins derived from indene, coumarone, or dicyclopentadiene see (37). — For addition of C̄ to alkynes in pres. of a condensing agent such as $AlCl_3$, $ZnCl_2$, etc., see (38) cf. (39).]

With alcohols. C̄ with alcohols gives in general the corresp. alkyl stearates. [E g, C̄ with MeOH gives methyl stearate (1:2095), m.p. 38.8°; C̄ with EtOH gives ethyl stearate (1:2078), α-form, m.p. 30.9°, β-form, m.p. 33.5°. — C̄ with benzyl alc. (1:6480) gives (40) benzyl stearate, m.p. 45 8°; C̄ with menthol (1:5940) gives (41) menthyl stearate, m.p. 38–39°.]

C̄ has also been much employed in the prepn. of mixed glycerides, but this topic cannot be expanded in detail in this text.

With phenols. [C̄ on htg. with phenols splits out HCl yielding the corresp. esters: e.g, C̄ with phenol (1:1420) gives (1) phenyl stearate, m.p. 52° (1), 51.5–53.0 (44), b.p. 267° at 15 mm. (1); C̄ with *p*-cresol (1:1410) gives (1) *p*-tolyl stearate, m.p. 54°, b p. 276° at 15 mm.]

[C̄ (2 moles) with pyrocatechol (1:1520) at 100° gives (42) (43) pyrocatechol distearate, m.p. 83–85° (43), 68° (42); C̄ (2 moles) with hydroquinone (1:1590) at 130° gives (42) hydroquinone distearate, m.p. 97°.]

[C̄ with phenol (1:1420) + $AlCl_3$ in *sym*-tetrachloroethane (3:5750) as solvent, however, gives (45) (44) (46) a mixt. of the corresp. hydroxystearophenones: viz., 27.8% yield *o*-hydroxyphenyl heptadecyl ketone, m.p. 64–66° (corresp. 2,4-dinitrophenylhydrazone, m.p. 96–97° (45)); and 28% yield *p*-hydroxyphenyl heptadecyl ketone, m.p. 87–89° corresp. 2,4-dinitrophenylhydrazone, m.p. 139.5–140° (45)); for study of influence upon *o/p* ratio of use of nitrobenzene or of CS_2 as solvents see (46).]

With salts of organic acids. [C̄ with Ag stearate at 100° for 10 min. gives (47) stearic anhydride (1:4915), m.p. 71–72° (48), 71–71.5° (49), 70.7° (50), 70.5° (47), 70–71° (51), but the latter is usually prepd. from stearic acid (1:0660) by htg. with Ac_2O (48) (49) (50) (51).]

With esters. [C̄ with ethyl sodio-acetoacetate refluxed 1 hr. under N_2 gives (68% yield (52)) ethyl α-stearoylacetoacetate, m.p. 42°; note that this prod. with aq. NaOH splits off its acetyl group giving (74% yield (52)) ethyl stearoylacetate, m.p. 46 5° (corresp. copper enolate, m.p. 111–112°).]

With Grignard reagents. [C̄ with *ter*-BuMgBr gives (28.5% yield (8)) *ter*-butyl *n*-heptadecyl ketone, m.p. 44.8–45.1° (corresp. semicarbazone, m.p. 78.0–78 2°); note that low yield suggests probability that the RMgBr also acted as a reducing agent cf. corresp. behavior of lauroyl chloride (3:9858), but no study of such effect for this combination is reported. — C̄ with cyclohexyl MgBr gives (8) cyclohexyl *n*-heptadecyl ketone.]

[C̄ with EtMgBr + $CdCl_2$ (53) or C̄ with $ZnEt_2$ (54) gives (65% yield (53)) ethyl *n*-heptadecyl ketone (eikosanone-3) [Beil. I-719, I_1-(374), I_2-(774)], m p 60–61° (54), 59.5–60° (55), 57° (28), 54–55° (53) (corresp. oxime, m p. 55.5–56.5° (54), semicarbazone, m.p. 89–91° (53))]

With diazomethane. [C̄ with CH_2N_2 (2 2 moles) as directed gives (88.5% yield (15)) 1-diazononadecanone-2, m.p. 69°, which in AcOH loses N_2 and esterifies giving (89% yield (15)) nonadecanon-2-yl-l acetate, m.p. 72°.]

With amines. C̄ with org. prim. amines yields the corresp. amides [e g., C̄ with *p*-cymidine (2-methyl-5-isopropylaniline) gives (56) stearo-(2-methyl-5-isopropyl)anilide, m.p. 93–94°; C̄ with vanillylamine (4-hydroxy-3-methoxybenzylamine) gives (5) *N*-(vanillyl)-stearamide, α-form, m.p 94 5–95°, β-form, m.p. 90.0–90 5°].

C̄ on hydrolysis yields stearic acid (1:0660), m.p. 69–70°; for the amide, anilide, *p*-toluidide, and other derivatives corresp. to C̄ see stearic acid (1:0660).

CHAPTER XXIII

I. INDEX OF COMPOUNDS ACCORDING TO EMPIRICAL FORMULA

This Empirical Formula Index comprises four parts as follows:

A. Compounds containing only carbon and chlorine.
B. Compounds containing only carbon, oxygen, and chlorine.
C. Compounds containing only carbon, hydrogen, and chlorine.
D. Compounds containing only carbon, hydrogen, oxygen, and chlorine.

Within each section the component individuals are arranged in groups according to increasing number of carbon atoms. Within each group of isomeric compounds the order of listing follows the sequence of the eight units comprising the Chemical Type Index.

A. COMPOUNDS CONTAINING ONLY CARBON AND CHLORINE

C_1 GROUP

CCl_4 M.W. = 153.8 Cl = 92.2%
Carbon tetrachloride **3:5100**

C_2 GROUP

C_2Cl_2 M.W. = 94.9 Cl = 74.7%
Dichloroacetylene **3:5010**

C_2Cl_4 M.W. = 165.8 Cl = 85.5%
Tetrachloroethylene **3:5460**

C_2Cl_6 M.W. = 236.8 Cl = 89.9%
Hexachloroethane **3:4835**

C_3 GROUP

C_3Cl_6 M.W. = 248.8 Cl = 85.5%
Hexachloropropene **3:6370**

C_3Cl_8 M.W. = 319.7 Cl = 88.7%
Octachloropropane **3:4450**

C_4 GROUP

C_4Cl_2 M.W. = 119.0 Cl = 59.6%
1,4-Dichlorobutadi-yne-1,3 **3:9040**

C_4Cl_6 M.W. = 260.8 Cl = 81.6%
Hexachlorobutadiene-1,3 **3:6425**

C_5 GROUP

C_5Cl_8 M.W. = 343.7 Cl = 82.5%
Octachlorocyclopentene **3:0422**

C_6 GROUP

C_6Cl_6 M.W. = 284.8 Cl = 74.7%
Hexachlorobenzene **3:4939**

C_{10} GROUP

$C_{10}Cl_8$ M.W. = 403.8 Cl = 70.3%
Octachloronaphthalene **3:4893**

B. COMPOUNDS CONTAINING ONLY CARBON, OXYGEN, AND CHLORINE

C_1 GROUP

$COCl_2$ M.W. = 98.9 Cl = 71.7%
Carbonyl chloride (phosgene) **3:5000**

C_2 GROUP

C_2OCl_4 M.W. = 181.8 Cl = 78.0%
Trichloroacetyl chloride **3:5420**

$C_2O_2Cl_2$ M.W. = 126.9 Cl = 55.9%
Oxalyl (di)chloride **3:5060**

$C_2O_2Cl_4$ M.W. = 197.8 Cl = 71.7%
Trichloromethyl chloroformate (diphosgene) **3:5515**

C_3 GROUP

C_3OCl_4 M.W.=193 9 Cl=73.2%
Trichloroacryloyl chloride **3:5845**

C_3OCl_6 M.W.=124.1 Cl=58.1%
Hexachloroacetone **3:6312**
Pentachloropropionyl chloride **3:0470**

$C_3O_2Cl_6$ M.W.=280.8 Cl=75.8%
Trichloromethyl trichloroacetate **3:0290**

$C_3O_3Cl_6$ M.W.=296.8 Cl=71.7%
Di-(trichloromethyl) carbonate (triphosgene) **3:1915**

C_4 GROUP

C_4OCl_6 M.W.=276.8 Cl=76 9%
Di-(trichlorovinyl) ether **3:6373**

C_4OCl_{10} M.W.=418 6 Cl=84.7%
Decachlorodiethyl ether **3:1676**

$C_4O_2Cl_4$ M.W.=221.9 Cl=63.9%
Dichloromaleyl (di)chloride **3:6197**

$C_4O_3Cl_2$ M.W.=167.0 Cl=42.5%
Dichloromaleic anhydride **3:3635**

$C_4O_3Cl_6$ M.W.=308.8 Cl=68.9%
Trichloroacetic acid anhydride **3:6575**

C_6 GROUP

C_6OCl_6 M.W.=300.8 Cl=70.0%
"Hexachlorophenol" **3:3180**

$C_6O_2Cl_4$ M.W.=245.9 Cl=57.7%
Tetrachlorobenzoquinone-1,2 **3:3965**
Tetrachlorobenzoquinone-1,4 (chloranil) **3:4978**

$C_6O_2Cl_6$ M.W.=316.8 Cl=67.2%
2,3,5,5,6,6-Hexachloro-cyclohexen-2-dione-1,4 **3:3260**
"Hexachloro*resorcinol*" ***3:3470***

C_7 GROUP

101° (121), and 1,4-dichloro-2,5-dinitrobenzene, m.p. 119° (122) (121) (124). — For f.p. compn. data and diagrams of mixtures of the 2,6- and 2,3-dinitro-*p*-dichlorobenzenes see (119), of mixtures of the 2,6- and 2,5-dinitro-*p*-dichlorobenzenes see (121). — Note also that the prod., m.p. 81°, formerly (8) supposed to be the 2,5-dinitro isomer, has since (121) been proved to be a compound of the 2,6- and 2,5-dinitro-1,4-dichlorobenzenes. — The relative proportion of the three dinitration products varies with conditions (119) (121) (122) (124).]

[C̄ on monosulfonation, e.g., with 1.5 wt. pts. fumg. H_2SO_4 (10–12% SO_3) at 140–150° for 45 min. (118) cf. (27), gives on pouring into aq (85–90% yield (118)) 1,4-dichlorobenzenesulfonic acid-2, cryst. from aq. as monohydrate (for derivs see below). — Note that C̄ is not sulfonated by conc. H_2SO_4 even at 210° (16) (dif. from *o*-dichlorobenzene (3:6055) and use in sepn. from C̄); for removal of chlorobenzene (3:7903) from mixt. with dichlorobenzenes via sulfonation of former with 95% H_2SO_4 see (17) — For use of reactn. prod. of C̄ with SO_2 as dye intermed. or for mothproofing of wool see (125). — For reactn. of sodium *p*-dichlorobenzenesulfonate with fused NaOH to yield hydroquinone (1:1590) see (126).]

[*C̄ with 5 moles $ClSO_3H$ at 150° for 1 hr. (127) (128) gives (85% yield (127) (128)) 1,4-dichlorobenzenesulfonyl chloride-2, cryst. from lgr., m.p. 39° (127) (128), 38° (129), 36.8° (27) (corresp. amide, see below; corresp. sulfonanilide, m.p. 160° (128)); for use in* prepn. of tetrachlorothioindigo see (130) — C̄ with 30 pts $ClSO_3H$ at 140° for 48 hrs. (128) gives both 1,4-dichlorobenzene-*bis*-(sulfonyl chloride)-2,6, m.p. 114° (corresp. *bis*-sulfonanilide, m.p. 215–217° dec (128)) and 1,4-dichlorobenzene-*bis*-(sulfonyl chloride)-2,5, m.p. 182° (corresp. *bis*-sulfonanilide, m.p. not given). — Note that C̄ reacts with $ClSO_3H$ much less easily than *o*-dichlorobenzene; for use in sepn. of the two isomers via formn. of *o*-dichlorobenzenesulfonyl chloride and sepn. from unchanged C̄ by distn. see (131).]

Ⓓ **1,4-Dichlorobenzenesulfonamide-2** (2,5-dichlorobenzenesulfonamide-1): cryst. from dil. alc., m.p. 179.5–180° u.c. (129), 181° (127), 185–186° (27) [From C̄ via treatment with $ClSO_3H$ as directed (129) to 1,4-dichlorobenzenesulfonyl chloride-2 (see above) and subsequent conv with $(NH_4)_2CO_3$ to desired sulfonamide.] — [Note that, although the m.p. of this sulfonamide is practically identical with that from *m*-dichlorobenzene (3:5960), each depresses the m.p. of a mixt with the other; the m.p.'s of the precursor sulfonyl chlorides, viz 52–53° for the isomer from *m*-dichlorobenzene, 38° for that from C̄, may also serve to distinguish them (129).] — [For similar prepn. and use of 1,4-dichlorobenzenesulfonamide-2 see (132).]

M.P. 53–54.5° (1)

Colorless crystals.

[For prepn. from α,ω-octadecamethylene glycol (m.p. 97–98°) with $SOCl_2$ + dimethylaniline in C_6H_6 (50% yield) see (1); note that a little 1,18-dichloro-octadecane with m.p. 54° (i.e., practically the same as Č) is also formed.]

Č is only slightly attacked by KOH (2).

Ⓓ 18-Chloro-octadecyl *N*-phenylcarbamate: lfts. from alc. or lt. pet., m.p. 77° (1).

3:0985 (1) Bennett, Gudgeon, *J. Chem. Soc.* 1938, 1679–1681. (2) Seck, Dittmar, *Chem. Umschau Fette, Öle, Wachse, Harze* 39, 226–229 (1932); *Cent.* 1933, I 1757, [*C.A.* 27, 703 (1933)].

3:0990 1,2,3-TRICHLOROBENZENE $C_6H_3Cl_3$ Beil. V - 203

(*vic*-Trichlorobenzene) V₁-(112) V₂-(150)

M.P. 54°	(1)	**B.P. 218–219° (3)**
53–54°	(2) (3)	
52.3–53.0°	(4)	
52.4°	(5)	
52°	(6)	
50.8°	(7)	

Tbls. from alc.; eas. sol. CS_2 or C_6H_6; spar. sol. alc.; volatile with steam. [For use as component of mixtures for dif. inflammable electric insulating materials see (8).] [For thermal anal. of mixts. of Č with 1,2,4-trichlorobenzene (3:6420) and with 1,3,5-trichlorobenzene (3:1400) see (5).]

[For prepn. of Č from 2,3,4-trichloroaniline [Beil. XII-626] with ethyl nitrite (3) or by diazotization and reaction with alc. (35% yield (4)), or from 3,4,5-trichloroaniline [Beil.

II. INDEX OF EMPIRICAL FORMULAS ACCORDING TO PERCENTAGE CHLORINE CONTENT

The empirical formulas for all groups of isomers listed in this book are represented below in diminishing order of their percentage chlorine. Note that there are numerous instances in which this value is the same for several different formulas. An analogous list of empirical formulas arranged according to their molecular weights comprises Index III (page 1383).

To ascertain which specific compounds corresponding to a given formula are described in the text of this volume, see the Empirical Formula Index (page 1359).

% Chlorine	Formula	% Chlorine	Formula	% Chlorine	Formula

III. INDEX OF EMPIRICAL FORMULAS ACCORDING TO MOLECULAR WEIGHTS

The empirical formulas for all groups of isomers listed in this book are represented below in increasing order of their molecular weights. Note that there are numerous instances in which this value is the same for several different formulas. An analogous list of empirical formulas arranged according to their percentage chlorine comprises Index II (page 1380).

To ascertain which specific compounds corresponding to a given formula are described in the text of this volume see the Empirical Formula Index (page 1359).

M.W.	Formula	M.W.	Formula	M.W.	Formula

IV. INDEX OF COMPOUNDS ACCORDING TO CHEMICAL TYPES

The numerous individual compounds of Order III whose preparation, properties, and reactions comprise the main text of this book are there listed in progressively increasing order of melting points (Division A, Solids), boiling points (Division B, Liquids), or empirical formulas (Division C, liquids for which data at ordinary pressure are not available). Unlike the treatment of Order I in an earlier volume, the compounds of the present Order III are not subdivided into genera. For this reason a highly useful feature of this volume is the following Chemical Type Index in which each compound is listed in one (or more) of the following eight arbitrary units.

UNIT 1. Chloro substitution products of saturated acyclic hydrocarbons.
UNIT 2. Chloro substitution products of unsaturated acyclic hydrocarbons
UNIT 3. Chloro substitution products of cyclic hydrocarbons.
UNIT 4. Chloro substitution products of hydroxy compounds.
UNIT 5. Chlorosubstitution products (and their relatives) of carbonyl compounds.
UNIT 6. Chloro substitution products of carboxylic acids and anhydrides.
UNIT 7. Acyl chlorides.
UNIT 8. Chlorine substitution products of ethers and of esters.

In order to facilitate recognition of the extent of subdivision of the above eight *units*, a brief summary of the subclassification is placed at the head of each one. Note that the names employed in this index are those best suited to recognition of the chemical relationships involved, and are not necessarily the same as those selected as principal names in the individual descriptions in the text.

Attention is also called to the fact that, in addition to this chemical type index, this volume is provided with conventional alphabetical name index and with empirical formula index.

UNIT 1. CHLORO SUBSTITUTION PRODUCTS OF ACYCLIC SATURATED HYDROCARBONS

(Summary of Classification of Unit 1)

A. MONOCHLORO DERIVATIVES.
1. *With primary halogen.*
2. *With secondary halogen.*
3. *With tertiary halogen.*

	1-Chloro-2-ethylbutane	3:7720

XII-630, XII_1-(313)] via diazotization (9) (6) and reaction with alc. (9), or by reduction to 3,4,5-trichlorophenylhydrazine and reaction of this with Fehling soln. (poor yield (6)) (5), see indic. refs.; for prepn. of $\bar{C}$ from 2,3-dichloroaniline [Beil. XII-621] (7) or from 2,6-dichloroaniline [Beil. XII-626] (7) (4) via diazotization and use of Cu_2Cl_2 reaction see indic. refs.; for prepn. of $\bar{C}$ from 4-chloro-3,5-diaminobenzenesulfonic acid-1 [Beil. XIV-718, XIV_1-(727)] via conv. to 3,4,5-trichlorobenzenesulfonic acid-1 and subsequently hydrolyzing the sulfonic acid group see (1).]

[For formn. of $\bar{C}$ (together with other prod.) from a mixt. of *o*- and *p*-dichlorobenzenes with Cl_2 (10), or from *m*-dichlorobenzene + $AlCl_3$ + Cl_2 (11), or from α-, β-, or γ-benzenehexachlorides with alc. KOH (5), or from α-benzenehexachloride with pyridine or quinoline (5), see indic. refs.]

[$\bar{C}$ with Cl_2 in pres. of Al/Hg yields (9) exclusively 1,2,3,4-tetrachlorobenzene (3:0655), m.p. 44–45° (9); $\bar{C}$ with liq. Cl_2 in s.t. at room temp. for 7 days adds 6 atoms halogen yielding (12) 1,1′,2,2′,3,3′,4,5,6-enneachlorocyclohexane (1,2,3-trichlorobenzene hexachloride), pr. from MeOH, m.p. 80° (12).]

[$\bar{C}$ on hydrolysis with steam at 550–800° over cat. yields (13) pyrogallol (1:1555); for behavior of $\bar{C}$ with NaOMe in MeOH see (6) (14).]

$\bar{C}$ on mononitration, e.g., by soln. of $\bar{C}$ (1 g.) in 5 ml. fumg. HNO_3 ($D = 1.49$) (17), gives 100% yield (17) 1,2,3-trichloro-4-nitrobenzene [Beil. V-246], long colorless ndls. from alc., m.p. 56° (15) (7), 55–56° (17) (3) (note that the isomeric 1,2,3-trichloro-5-nitrobenzene [Beil. V-247, V_1-(131)] has m.p. 72°).

$\bar{C}$ on dinitration, e.g., $\bar{C}$ (1 g.) refluxed 1 hr. with 5 ml. fumg. HNO_3 ($D = 1.49$) + 5 ml. conc. H_2SO_4, then poured into aq. (17) (16), gives 100% yield 1,2,3-trichloro-4,6-dinitrobenzene, ndls. from hot alc., m.p. 92–93° (16) (17); this prod. (1 g). htd. 1 hr. at 100° with 5 g. aniline as directed (17) yields 1,3-dianilino-2-chloro-4,6-dinitrobenzene, cryst. from C_6H_6 or alc., m.p. 136–138° (17). [Note that an isomeric 1,2,3-trichloro-4,5-dinitrobenzene, cryst. from alc., m.p. 105–106° (16), has been obtd. by further nitration of 1,2,3-trichloro-5-nitrobenzene (mentioned in preceding paragraph).]

$\bar{C}$ with chlorosulfonic acid as directed (17) gives 1,2,3-trichlorobenzenesulfonyl chloride-4, m.p. 64–65° u.c. (17), 65–66° (2); this prod. with $(NH_4)_2CO_3$ readily yields (17) 1,2,3-trichlorobenzenesulfonamide-4, m.p. 226–230° dec. u.c. (17).

	2,5-Dichlorohexane. .	**3:8525**
	3,4-Dichlorohexane...	**3:9344**

3. *With both chlorine atoms* tertiary

$C_6H_{12}Cl_2$	2,3-Dichloro-2,3-dimethylbutane. ..	**3:4520**
$C_7H_{14}Cl_2$	2,4-Dichloro-2,4-dimethylpentane ..	**3:9428**
$C_8H_{16}Cl_2$	2,5-Dichloro-2,5-dimethylhexane....	**3:1550**
	3,4-Dichloro-3,4-dimethylhexane....	**3:8315**
$C_9H_{18}Cl_2$	2,6-Dichloro-2,6-dimethylheptane...	**3:0455**
$C_{10}H_{20}Cl_2$	2,7-Dichloro-2,7-dimethyloctane....	**3:0840**
	3,4-Dichloro-3,4-dimethylhexane....	**3:9724**

4. *With one chlorine* primary *and one* secondary

$C_3H_6Cl_2$	1,2-Dichloropropane..	**3:5200**
$C_4H_8Cl_2$	1,2-Dichlorobutane...	**3:7680**
	1,3-Dichlorobutane...	**3:7925**
$C_5H_{10}Cl_2$	1,2-Dichloropentane..	**3:8140**
	1,3-Dichloropentane..	**3:9220**
	1,4-Dichloropentane..	**3:9224**
	1,3-Dichloro-2-methylbutane	**3:9228**
	3,4-Dichloro-2-methylbutane...........	**3:8075**
$C_6H_{12}Cl_2$	1,2-Dichlorohexane ..	**3:8380**
	1,5-Dichlorohexane...	**3:9340**
$C_7H_{14}Cl_2$	1,2-Dichloroheptane..	**3:9420**
	1,2-Dichloro-4,4-dimethylpentane...	**3:8516**
$C_8H_{16}Cl_2$	1,6-Dichloro-octane...	**3:9530**
	1,7-Dichloro-octane...	**3:9532**
	4-Chloro-3-(chloromethyl)heptane.. .	**3:9534**
$C_9H_{18}Cl_2$	1,2-Dichlorononane...	**3:9632**

5. *With one chlorine* primary *and one* tertiary

$C_4H_8Cl_2$	1,2-Dichloro-2-methylpropane.....	**3:7430**
$C_5H_{10}Cl_2$	1,2-Dichloro-2-methylbutane......	**3:7920**
	2,4-Dichloro-2-methylbutane......	**3:8105**
$C_6H_{12}Cl_2$	2,5-Dichloro-2-methylpentane.....	**3:8540**

6. *With one chlorine* secondary *and one* tertiary

$C_5H_{10}Cl_2$	2,3-Dichloro-2-methylbutane......	**3:7975**
$C_6H_{12}Cl_2$	2,3-Dichloro-2-methylpentane.....	**3:9346**

C. Trichloro Derivatives

1. *With all three chlorine atoms* primary

$CHCl_3$	Chloroform........ .	**3:5050**

$C_6H_{11}Cl$	2-Chlorohexene-1	3:7530
	3-Chlorohexene-3.....	3:7535
	2-Chloro-3,3-dimethylbutene-1..........	3:7340
$C_7H_{13}Cl$	2-Chloroheptene-1....	3:7988
	4-Chloroheptene-3....	3:8023
	3-Chloro-2,4-dimethylpentene-2.........	3:7605
$C_8H_{15}Cl$	2-Chloro-octene-1 ...	3:8346
	2-Chloro-octene-2	3:8345
	4-Chloro-octene-4 .. .	3:8230
	2-Chloro-3-ethyl-3-methylpentene-1...	3:8115
$C_{10}H_{19}Cl$	5-Chlorodecene-5.....	3:9712

b_2 DICHLORO

$C_3H_4Cl_2$	2,3-Dichloropropene-1	3:5190
$C_4H_6Cl_2$	2,3-Dichlorobutene-1 .	3:9074
	1,2-Dichlorobutene-2 (h.-b.)......	3:5615
	1,2-Dichlorobutene-2 (l.-b.)	3:5360
	1,3-Dichlorobutene-2 .	3:5550
$C_5H_8Cl_2$	2,5-Dichloropentene-2	3:9202
	3,4-Dichloropentene-2	3:8045
	1,3-Dichloro-2-methylbutene-2..........	3:8170

b_3 POLYCHLORO

$C_4H_5Cl_3$	1,2,4-Trichlorobutene-2....	3:9062
	2,3,4-Trichlorobutene-2.....	3:9064
$C_4H_4Cl_4$	2,3,3,4-Tetrachlorobutene-1..........	3:9060

2. *With two chlorine atoms on* C *attached to unsaturation*

a. Both these chlorines are on same C atom

$C_2H_2Cl_2$	1,1-Dichloroethylene..	3:5005
$C_3H_4Cl_2$	1,1-Dichloropropene-1	3:5120
$C_4H_6Cl_2$	1,1-Dichloro-2-methylpropene-1.........	3:5300
C_2HCl_3	1,1,2-Trichloroethylene..........	3:5170
$C_3H_3Cl_3$	1,1,2-Trichloropropene-1.........	3:5395
$C_4H_5Cl_3$	1,1,3-Trichloro-2-methylpropene-1...	3:5025
$C_6H_9Cl_3$	1,1,2-Trichlorohexene-1.........	3:9326
C_2Cl_4	Tetrachloroethylene ..	3:5460
C_3HCl_5	1,1,2,3,3-Pentachloropropene-1.........	3:6075
C_3Cl_6	Hexachloropropene...	3:6370

These two chlorines are on different carbons

$(-\underset{Cl}{\underset{\mid}{C}}=\underset{Cl}{\underset{\mid}{C}}-)$

$C_2H_2Cl_2$	*cis*-1,2-Dichloroethylene	3:5042
	trans-1,2-Dichloroethylene..........	3:5028
$C_3H_4Cl_2$	1,2-Dichloropropene-1 (h.-b. isomer)	3:5150
	1,2-Dichloropropene-1 (l.-b. isomer)......	3:5110
	cis-2,3-Dichlorobutene-2..........	3:5500
	trans-2,3-Dichlorobutene-2	3:7395
$C_6H_{10}Cl_2$	1,2-Dichlorohexene-1 .	3:9330
C_2HCl_3	1,1,2-Trichloroethylene.........	3:5170
$C_3H_3Cl_3$	1,1,2-Trichloropropene-1.	3:5395
	1,2,3-Trichloropropene-1............	3:5050
$C_3H_2Cl_4$	1,2,3,3-Tetrachloropropene-1.........	3:5920
C_2Cl_4	Tetrachloroethylene ..	3:5460
$C_4H_2Cl_6$	1,1,2,3,4,4-Hexachlorobutene-2	
	(liquid isomer).......	3:9046
	(solid isomer)........	3:1945
$C_6H_6Cl_6$	1,2,3,4,5,6-Hexachlorohexene-3.....	3:1220

b. Dichloro

C_2Cl_2	Dichloroacetylene....	**3:5010**

2. ***With chlorine(s) attached to some* C *other than that bearing triple bond***

a. Monochloro

a_1 CHLORINE IS PRIMARY

C_3H_3Cl	3-Chloropropyne-1....	**3:7100**
C_4H_5Cl	1-Chlorobutyne-2.....	**3:7175**
$C_8H_{13}Cl$	1-Chloro-octyne-2....	**3:9514**

a_2 CHLORINE IS TERTIARY

C_5H_7Cl	3-Chloro-3-methylbutyne-1........	**3:7155**
C_6H_9Cl	3-Chloro-3-methylpentyne-1..	**3:9322**
	4-Chloro-4-methylpentyne-2.......	**3:9324**
$C_8H_{13}Cl$	3-Chloro-3-methylheptyne-4.........	**3:9516**
$C_9H_{15}Cl$	2-Chloro-2-methyloctyne-3..........	**3:9622**
$C_{10}H_{17}Cl$	3-Chloro-3-methylnonyne-4.	**3:9710**

b. Dichloro

$C_8H_{12}Cl_2$	2,5-Dichloro-2,5-dimethylhexene-3 ..	**3:9504**

F. Of Alkadi-ynes

C_4Cl_2	1,4-Dichlorobuta-di-yne-1,3.........	**3:9040**

G. Of Alkenynes

C_4H_3Cl	1-Chlorobuten-3-yne-1	**3:7070**
C_7H_9Cl	5-Chloro-5-methylhexen-1-yne-3 ..	**3:9402**

UNIT 3. CHLORO SUBSTITUTION PRODUCTS OF HYDROCARBONS CONTAINING CYCLIC NUCLEI

(Summary of Classification of Unit 3)

A. Of Cycloalkanes.
B. Of Mononuclear Aromatic Hydrocarbons.
  1. *With all chlorine in nucleus.*
  2. *With all chlorine in side chain(s).*
    a. Saturated side chain(s).
    b. Unsaturated side chain(s).
  3. *With chlorine both in ring and in side chain(s).*
C. Of Polynuclear Aromatic Hydrocarbons.
  1. *With all chlorine in nucleus.*
    a. Systems with uncondensed rings.
    b. Systems with condensed rings.
  2. *With all chlorine in side chain(s).*
    a. Systems with two uncondensed rings.
    b. Systems with two condensed rings.
    c. Systems with three uncondensed rings.
  3. *With chlorine both in nucleus and side chain.*

UNIT 3. CHLORO SUBSTITUTION PRODUCTS OF HYDROCARBONS CONTAINING CYCLIC NUCLEI

A. Of Cycloalkanes

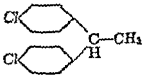
C_5H_9Cl	Chlorocyclopentane...	**3:7545**
$C_6H_{11}Cl$	Chlorocyclohexane....	**3:8040**
$C_6H_6Cl_6$	*cis*-1,2,3,4,5,6-Hexachlorocyclohexane..	**3:4410**
	trans-1,2,3,4,5,6-Hexachlorocyclohexane..	**3:4990**

B. Of Mononuclear Aromatic Hydrocarbons

1. ***With all chlorine in nucleus***

C_6H_5Cl	Chlorobenzene.......	**3:7903**
$C_6H_4Cl_2$	*o*-Dichlorobenzene ...	**3:6055**
	m-Dichlorobenzene...	**3:5960**
	p-Dichlorobenzene....	**3:0980**

3:0995 1,1-Di-(*p*-CHLOROPHENYL)ETHANE $C_{14}H_{12}Cl_2$ **Beil. S.N. 470**



M.P. 54–55° (1) **B.P. 143–145° at 2 mm. (1)**

Colorless cryst. from 90% AcOH. — Note that, when pure, neither solid Č nor its solns. show any fluorescence either in visible or ultraviolet light. (1). — Note also that, although m.p. of Č is identical with that of its next lower homolog, viz., di-(*p*-chlorophenyl)methane (4,4'-dichlorodiphenylmethane) (3:1057), nevertheless the m.p. of their mixture is depressed to 40–50° (1).

[For prepn. of Č from 1,1-di-(*p*-chlorophenyl)ethylene (3:2475) by cat. hydrogenation (62% yield) see (1); for formn. of Č from chlorobenzene (3:7903) with acetylene in presence of $AlCl_3$ see (2), but note that by this method various undetermined impurities which show blue fluorescence are also formed (1).]

Č on oxidn. with CrO_3/AcOH + trace of H_2SO_4 gives (1) 4,4'-dichlorobenzophenone (3:4270), m.p. 142–144°.

Č does *not* (1) yield an addn. prod. with PkOH.

3:0995 (1) Grummitt, Buck, Becker, *J. Am. Chem. Soc.* **67**, 2265–2266 (1945). (2) Cook, Chambers, *J. Am. Chem. Soc.* **43**, 338 (1921).

UNIT 4. CHLORO SUBSTITUTION PRODUCTS OF HYDROXY COMPOUNDS

A. Of Alcohols

1. *Of acyclic alcohols*

a. Saturated monohydric

a₁ PRIMARY

C_2H_5OCl	2-Chloroethanol-1	**3:5552**
$C_2H_4OCl_2$	2,2-Dichloroethanol-1	**3:5745**

	3-Chloropropen-2-ol-1	**3:5820**

UNIT 4. CHLORO SUBSTITUTION PRODUCTS OF HYDROXY COMPOUNDS

(Summary of Classification of Unit 4)

A. Of Alcohols
- 1. *Of acyclic alcohols.*
  - *a.* Saturated monohydric.
    - a_1 Primary.
    - a_2 Secondary.
    - a_3 Tertiary.
  - *b.* Saturated dihydric.
  - *c.* Unsaturated (olefinic) monohydric.
    - c_1 Primary.
    - c_2 Secondary.
- 2. *Of cyclanols (alicyclic alcohols).*
- 3. *Of aromatic alcohols.*
- 4. *Of alcohols containing also other functional groups.*
  - *a.* Ether/alcohols.
  - *b.* Ester/alcohols.
  - *c.* Ether/ester/alcohols.
  - *d.* Acid/alcohols (hydroxy acids).

B. Of Phenols.
- 1. *Of mononuclear phenols.*
  - *a.* Monohydric.
    - a_1 Derivatives of phenol.
    - a_2 Derivatives of methylphenols.
    - a_3 Derivatives of xylenols.
    - a_4 Derivatives of miscellaneous alkylphenols.
    - a_5 Derivatives of phenolic aldehydes.
    - a_6 Derivatives of phenolic acids.
    - a_7 Derivatives of phenolic acid chlorides.
  - *b.* Dihydric.
    - b_1 Derivatives of pyrocatechol.
    - b_2 Derivatives of resorcinol.
    - b_3 Derivatives of hydroquinone.
  - *c.* Trihydric.
- 2. *Of binuclear phenols.*
  - *a.* Monohydric.
    - a_1 With uncondensed rings.
    - a_2 With condensed rings.

UNIT 5. CHLORO SUBSTITUTION PRODUCTS OF CARBONYL COMPOUNDS (AND THEIR RELATIVES)

(Summary of Classification of Unit 5)

A. Of Aldehydes.
- 1. *Acyclic aldehydes.*
  - *a.* Saturated.
  - *b.* Unsaturated.
  - *c.* Relatives of the above.
    - c_1 Hydrates.
    - c_2 Hemiacetals.
    - c_3 Diethylacetals.
    - c_4 Acetals with chlorine only in alcohol radicals;
    - c_5 Polymers.
- 2. *Aromatic aldehydes.*
  - *a.* Simple aldehydes.
  - *b.* Phenolic aldehydes.

B. Of Ketones.
- 1. *Dialkyl ketones.*
- 2. *Alicyclic ketones.*
- 3. *Alkyl aryl ketones.*
  - *a.* With chlorine only in alkyl.
  - *b.* With chlorine both in alkyl and aryl.
  - *c.* With chlorine only in aryl.
- 4. *Diaryl ketones.*
- 5. *Ketones containing also other functional groups.*
  - *a.* Keto-acid chlorides.
  - *b.* Keto-acid esters.

C. Of Quinones.
- 1. *Mononuclear quinones.*
- 2. *Dinuclear quinones.*
- 3. *Trinuclear quinones.*

UNIT 5. CHLORO SUBSTITUTION PRODUCTS OF CARBONYL COMPOUNDS (AND THEIR RELATIVES)

A. Of Aldehydes

1. *Acyclic Aldehydes*

a. Saturated

C_2H_3OCl	Chloroacetaldehyde...	**3:7212**
$C_2H_2OCl_2$	Dichloroacetaldehyde.	**3:5180**
C_2HOCl_3	Trichloroacetaldehyde	**3:5210**
C_3H_5OCl	α-Chloropropionaldehyde...........	**3:5160**
	β-Chloropropionaldehyde..............	**3:5576**
$C_3H_4OCl_2$	α,α-Dichloropropionaldehyde.........	**3:9033-A**
	α,β-Dichloropropionaldehyde..........	**3:9034**
$C_3H_3OCl_3$	α,α,β-Trichloropropionaldehyde......	**3:9033**
C_4H_7OCl	α-Chloro-*n*-butyraldehyde.....	**3:9109**
	β-Chloro-*n*-butyraldehyde.....	**3:9110**
	γ-Chloro-*n*-butyraldehyde.....	**3:9111**
$C_4H_6OCl_2$	α,β-Dichloro-*n*-butyraldehyde.....	**3:9103**
$C_4H_5OCl_3$	α,α,β-Trichloro-*n*-butyraldehyde.....	**3:5910**
	α,α,γ-Trichloro-*n*-butyraldehyde.....	**3:9094**
C_4H_7OCl	α-Chloro-iso-butyraldehyde.....	**3:7235**
	β-Chloro-iso-butyraldehyde.....	**3:9112**

B. Of Isocyclic Acids.
  1. *With no other functional group.*
    a. Monobasic.
    b. Dibasic.
    c. Tribasic.
  2. *With some other functional group.*
    a. Phenolic acids.
    b. Ether acids.

C. Anhydrides of Acyclic Acids.
  1. Saturated.
  2. Unsaturated.

D. Anhydrides of Isocyclic Acids.

UNIT 6. CHLORO SUBSTITUTION PRODUCTS OF CARBOXYLIC ACIDS AND ANHYDRIDES

(For acyl chlorides see Unit 7)

A. *Of Acyclic Acids*
  1. *With no other functional group*
    a. Saturated monobasic

$C_2H_3O_2Cl$	Chloroacetic acid	3:1370
$C_2H_2O_2Cl_2$	Dichloroacetic acid	3:6208
$C_2HO_2Cl_3$	Trichloroacetic acid	3:1150
$C_3H_5O_2Cl$	α-Chloropropionic acid	3:6125
	β-Chloropropionic acid	3:0460
$C_3H_4O_2Cl_2$	α,α-Dichloropropionic acid	3:6162
	α,β-Dichloropropionic acid	3:0855
	β,β-Dichloropropionic acid	3:1058
$C_3H_3O_2Cl_3$	α,α,β-Trichloropropionic acid	3:1275
$C_3H_2O_2Cl_4$	α,α,β,β-Tetrachloropropionic acid	3:1850
$C_3HO_2Cl_5$	Pentachloropropionic acid	3:4895
$C_4H_7O_2Cl$	α-Chloro-*n*-butyric acid	3:9130
	β-Chloro-*n*-butyric acid	3:0035
	γ-Chloro-*n*-butyric acid	3:0020
$C_4H_6O_2Cl_2$	α,β-Dichloro-*n*-butyric acid	
	Higher-melting isomer	3:1903
	Lower-melting isomer	3:1375
$C_4H_5O_2Cl_3$	α,α,β-Trichloro-*n*-butyric acid	3:1280
$C_4H_5O_2Cl_3$ Contd.	α,α,γ-Trichloro-*n*-butyric acid	3:1831
	α,β,β-Trichloro-*n*-butryic acid	3:0925
	γ,γ,γ-Trichloro-*n*-butryic acid	3:1000
$C_4H_7O_2Cl$	α-Chloroisobutyric acid	3:0235
	β-Chloroisobutyric acid	3:9132
$C_5H_9O_2Cl$	α-Chloro-*n*-valeric acid	3:8783
	β-Chloro-*n*-valeric acid	3:0270
	γ-Chloro-*n*-valeric acid	3:9270
	δ-Chloro-*n*-valeric acid	3:0075
	α-Chloro-α-methyl-*n*-butyric acid	3:8718
	α-Chloro-β-methyl-*n*-butyric acid	3:0050
	β-Chloro-α,α-dimethyl-propionic acid	3:0440

b. Saturated dibasic

$C_4H_4O_4Cl_2$	*d,l*-α,α′-Dichlorosuccinic acid	3:4711
	meso-α,α′-Dichlorosuccinic acid	3:4930

c. Unsaturated (olefinic) monobasic

$C_3H_3O_2Cl$	α-Chloroacrylic acid	3:1445
	β-Chloroacrylic acid	3:2240
$C_3H_2O_2Cl_2$	α,β-Dichloroacrylic acid	3:2265
	β,β-Dichloroacrylic acid	3:1875
$C_3HO_2Cl_3$	α,β,β-Trichloroacrylic acid	3:1840

UNIT 6. CHLORO SUBSTITUTION PRODUCTS OF CARBOXYLIC ACIDS AND ANHYDRIDES

(Summary of Classification of Unit 6)

A. Of Acyclic Acids.

1. *With no other functional group.*
   - *a.* Saturated monobasic.
   - *b.* Saturated dibasic.
   - *c.* Unsaturated (olefinic) monobasic.
   - *d.* Unsaturated (olefinic) dibasic.
   - *e.* Unsaturated (acetylenic) monobasic.
2. *With some other functional group.*
   - *a.* Hydroxy monobasic.

CHAPTER IV

DIVISION A. SOLIDS

(3:1000–3:1499)

3:1000 γ,γ,γ-TRICHLORO-*n*-BUTYRIC ACID $C_4H_5O_2Cl_3$ Beil. S.N. 162
$Cl_3C.CH_2.CH_2.COOH$

M.P. 55° (1)

Colorless ndls. from hot aq.

[For prepn. of $\bar{C}$ from γ,γ,γ-trichloro-*n*-butyronitrile (see below) by hydrolysis with conc. HCl at 60° for 6 hrs. see (1).]

——γ,γ,γ-Trichloro-*n*-butyronitrile: ndls. from pet. ether, m.p. 41° u.c.; b.p. 214–216° at 760 mm., 90–95° at 12 mm. (1). [From acrylonitrile with $CHCl_3$ in pres. of aq. trimethylbenzylammonium hydroxide at 0.5° for 24 hrs. (11% yield (1)).] [Note that this nitrile upon acid hydrolysis gives $\bar{C}$, but upon alkaline hydrolysis gives succinic acid (1:0530), m.p. 188–189° (1).]

——γ,γ,γ-Trichloro-*n*-butyramide: cryst. from toluene, m.p. 89–90° u.c. (1). [From γ,γ,γ-trichloro-*n*-butyronitrile (above) with 27% H_2O_2 + aq. NaOH at 40–45° for 5 hrs. (1).]

3:1000 (1) Bruson, Niederhauser, Riener, Hester, *J. Am. Chem. Soc.* **67**, 601 (1945).

3:1010 3-CHLORO-2-HYDROXYBENZALDE-HYDE $C_7H_5O_2Cl$ Beil. VIII — VIII$_1$-(523)
(3-Chlorosalicylaldehyde)

M.P. 55° (1)
54.5–55.5° (2)
54° (3) (4)

Long colorless ndls. from MeOH (1). — Readily sol. in usual org. solvents (1). — Volatile with steam [diff. from 3-chloro-4-hydroxybenzaldehyde (3:4065) (1)].

[For prepn. from *o*-chlorophenol (3:5980) with $CHCl_3$ + alk. (10–15% yield (1)) or via condensation with formalin + alk. to 3-chloro-2-hydroxybenzyl alc. and oxidn. of latter with Na *m*-nitrobenzenesulfonate + alk. (2) see indic. refs.; from 3-chloro-2-hydroxybenzoic acid (3-chlorosalicylic ac.) (3:4745) by reductn. with Na/Hg in pres. of H_3BO_3 see (4).]

$\bar{C}$ with satd. aq. $NaHSO_3$ soln. yields $NaHSO_3$ cpd. (1) (2).

$\bar{C}$ dissolves in aq. alk. with yel. color (4) (2).

$\bar{C}$ with aq. $FeCl_3$ yields violet-red color (2).

$\bar{C}$ is not nitrated by cold AcOH/HNO_3 soln. (1); but $\bar{C}$ (2 g.) in AcOH (10 ml.) treated at 45° for 15 min. with soln. of 0.8 ml. conc. HNO_3 ($D = 1.42$) in AcOH (4 ml.), then poured into aq., gives (1) 2.15 g. 3-chloro-5-nitro-2-hydroxybenzaldehyde, yel. ndls. from dil. alc., m.p. 129° (1).

The methyl ether of $\bar{C}$, viz., 3-chloro-2-methoxybenzaldehyde, is a liq., b.p. abt. 255°, f.p. 0° (1).

UNIT 7. ACYL CHLORIDES

(Summary of Classification of Unit 7)

A. Of Acyclic Acids (R.CO.Cl).

1. *The radical (R) contains no chlorine.*
   - *a.* Corresponding acid is saturated and monobasic.
   - *b.* Corresponding acid is saturated and dibasic.
   - *c.* Corresponding acid is unsaturated and monobasic.
   - *d.* Corresponding acid is unsaturated and dibasic.
   - *e.* Corresponding acid contains also other functional groups.
     - e_1 Ether/acyl chloride.
     - e_2 Ester/acyl chloride.
     - e_3 Keto/acyl chloride.
2. *The radical (R) does contain chlorine.*
   - *a.* Corresponding acid is saturated and monobasic.
   - *b.* Corresponding acid is saturated and dibasic.
   - *c.* Corresponding acid is unsaturated and monobasic.
   - *d.* Corresponding acid is unsaturated and dibasic.
   - *e.* Corresponding acid contains other functional groups.

B. Of Isocyclic Acids.

1. *The radical (R) contains no chlorine.*
   - *a.* Corresponding acid is monobasic.
     - a_1 With —COOH group attached to ring.
     - a_2 With —COOH group attached to saturated side chain.
     - a_3 With —COOH group attached to unsaturated side chain.
     - a_4 With —COOH group attached to ring containing another functional group.
   - *b.* Corresponding acid is dibasic.
2. *The radical (R) does contain chlorine.*
   - *a.* Corresponding acid is monobasic.

C. Of Heterocyclic Acids.

1. *The radical (R) contains no chlorine.*
   - *a.* Corresponding acid is monobasic.

UNIT 7. ACYL CHLORIDES

A. Of Acyclic Acids (R.CO.OH)

1. *The radical (R) contains no chlorine*

a. Corresponding acid is saturated and monobasic

C_2H_3OCl	Acetyl chloride	3:7065
C_3H_5OCl	Propionyl chloride....	3:7170
C_4H_7OCl	*n*-Butyryl chloride ...	3:7370
	Isobutyryl chloride...	3:7270
C_5H_9OCl	*n*-Valeryl chloride....	3:7740
	α-Methyl-*n*-butyryl chloride...........	3:7603
	β-Methyl-*n*-butyryl chloride...........	3:7560

	α,α-Dimethyl-*n*-butyryl chloride....	3:7900
	α,β-Dimethyl-*n*-butyryl chloride....	3:7965
	β,β-Dimethyl-*n*-butyryl chloride.....	3:7890
$C_7H_{13}OCl$	*n*-Heptanoyl chloride .	3:8530

UNIT 8. CHLORO SUBSTITUTION PRODUCTS OF ETHERS AND OF ESTERS

(Summary of Classification of Unit 8)

A. Ethers.
- 1. *Completely acyclic saturated ethers.*
  - *a.* Monoethers.
    - a_1 Derived from symmetrical ethers.
    - a_2 Derived from unsymmetrical ethers.
  - *b.* Diethers.
  - *c.* Ethers containing also other functions.
    - c_1 Ether/alcohols.
    - c_2 Ether/esters.
    - c_3 Ether/ester/alcohols.
    - c_4 Ether/ester/acyl halides.
- 2. *Completely acyclic unsaturated ethers.*
- 3. *Cyclic ethers.*
  - *a.* Non-aromatic.
    - a_1 Monoethers.
    - a_2 Diethers.
  - b. Aromatic ethers (phenol ethers).
  - *c.* Heterocyclic ethers.

B. Esters.
- 1. *Esters of aliphatic acids.*
  - *a.* Acids containing no chlorine.
    - a_1 From acetic acid.
    - a_2 From oxalic acid.
    - a_3 From carbonic acid.
  - *b.* Saturated monobasic acids containing chlorine.
    - b_1 From chloroacetic acid.
    - b_2 From dichloroacetic acid.
    - b_3 From trichloroacetic acid.

Ⓓ 3-Chloro-2-hydroxybenzaldoxime: *lfts. from dil. alc., m.p. 167–168° (2).*

—— 3-Chloro-2-hydroxybenzaldehyde phenylhydrazone: unrecorded.

—— 3-Chloro-2-hydroxybenzaldehyde *p*-nitrophenylhydrazone: unrecorded.

—— 3-Chloro-2-hydroxybenzaldehyde 2,4-dinitrophenylhydrazone: unrecorded.

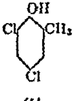
Ⓓ 3-Chloro-2-hydroxybenzaldehyde semicarbazone: cryst. from 50% AcOH, m.p. 240–243° (2).

3:1010 (1) Davies, Rubinstein, *J. Chem. Soc.* **123**, 2850 (1923). (2) Hanus, *J. prakt. Chem.* (2) **158**, 263–264 (1941). (3) Duff, *J. Chem. Soc.* **1941**, 547–550. (4) Bayer and Co., Ger. 228,838, Nov. 22, 1910; *Cent.* **1911**, I 51.

3:1020 4,6-DICHLORO-2-METHYLPHENOL $C_7H_6OCl_2$ Beil. VI - 359

(4,6-Dichloro-*o*-cresol) VI_1-(174)

VI_2-(332)



M.P. 56°	(1)	B.P. 220.5°		(1)
55°	(2) (7)	131°	at 28 mm.	(5)
54–55°	(3)	73–78°	at 4 mm.	(6)
54° u.c.	(4)			
53–54°	(5)			

Ndls. from hot aq. or pet. ether. Spar. sol. cold but more eas. sol. hot aq.; eas. sol. alc., ether, $CHCl_3$, CS_2. Volatile with steam.

[For prepn. of $\bar{C}$ from *o*-cresol (1:1400) with Cl_2 (7) (4) (1) in CCl_4 (61% yield (2)) in CCl_4 in pres. of Fe (8) or in pres. of PCl_3 in sunlight at elevated temp. (8), with Cl_2 in NaOH soln. at room temp. (5), or with SO_2Cl_2 (3), see indic. refs; for formn. from 2-methylphenoldisulfonic acid-4,6 (6) in nitrobenzene with Cl_2 (other products are also formed) see (6).]

[$\bar{C}$ with dry NH_3 gas at room temp. (9) forms a cpd., $\bar{C}.2NH_3$ (9); $\bar{C}$ on evapn. of alc. NH_3 soln. does *not* give an NH_4 salt but is recovered unchanged (dif. from 2,6-dichloro-4-methylphenol (3:0400) *q.v.*) (7).]

[$\bar{C}$ (1 pt.) *in 2 pts. ice-cold* HNO_3 (D = 1.48) *stood 24 hrs. gives* (37% *yield* (2)) a prod. of compn. $C_7H_4O_4N_2Cl_2$, white ndls. from dry ether by pptn. with pet. ether, m.p. 109° dec. (2).]

[$\bar{C}$ with boilg. dil. HNO_3 oxidizes (7) to oxalic acid (1:0445); $\bar{C}$ on oxidn. with $K_2Cr_2O_7$ + dil. H_2SO_4 gives (4) 6-chloro-2-methylbenzoquinone-1,4 (6-chloro-*p*-toluquinone) [Beil. VII-650, VII_1-(353)], yel. ndls., vol. with steam, m.p. 90° (4); $\bar{C}$ digested with aqua regia for 1½ hrs. at 100° gives (16% yield (5)) 3,5,6-trichloro-2-methylbenzoquinone-1,4 (trichloro-*p*-toluquinone) [Beil. VII-651, VII_1-(354)], yel. lfts. from alc., m.p. 233° (5); $\bar{C}$ with CrO_3/AcOH gives a mixt. (4) of chlorinated quinones.]

[$\bar{C}$ does not react with PCl_5 (10); $\bar{C}$ on monosulfonation with fumg. H_2SO_4 (65% SO_3) at 50° yields (11) 4,6-dichloro-2-methylphenolsulfonic acid-3; for condensation of $\bar{C}$ with benzaldehydesulfonic acid-4 and use as mothproofing agt. see (12).]

[$\bar{C}$ in MeOH/KOH refluxed 6½ hrs. with MeI (74% yield (3)), or $\bar{C}$ in aq. alk. with Me_2SO_4 (1) gives the *corresp. methyl ether (4,6-dichloro-2-methylanisole)*, m.p. 33° (1), 29–30° (3), b.p. 230° (1); $\bar{C}$ in aq. alk. soln. treated with Et_2SO_4 gives (1) corresp. ethyl ether (4,6-dichloro-2-methylphenetole), m.p. 27.5° (1).]

V. ALPHABETICAL NAME INDEX TO COMPOUNDS OF ORDER 3

1. Note that this index refers only to numbered compounds of Order 3; for practical reasons it cannot include the large number of related products which are incidentally mentioned within the text of these numbered individuals.

2. In this alphabetical name index all literal prefixes (such as those below) are ignored in establishing the alphabetical sequence. Note, however, that "iso" is not recognized as a prefix but is construed as an integral part of the name and therefore indexed under the letter I.

3. Within any given group of related prefixes the following sequences are employed:

d,l- . . . *allo-* . . . *meso-*	h.-m. . . . l.-m.
erythro- . . . *threo-*	*o-* . . . *m-* . . . *p-*
cis- . . . *trans-*	α- . . . β- . . . γ- . . . δ- . . . ω-
prim.- . . . *sec.-* . . . *ter-*	*bis-* . . . *tris-*
sym.- . . . *unsym.-*	solid . . . liquid

4. Note that except when needed to distinguish from other stereoisomers the prefix *d,l* is omitted from the alphabetical index names even when included in text of the individual compound.

5. Whenever in a particular name the syllable (di) is inserted in parentheses to avoid possible ambiguity, such syllable is ignored in establishing the alphabetical sequence.

6. For a given family of derivatives of the same halogen-free parent, the sequence of listing is based upon the parent, e.g., all the dichloro substitution products of naphthol-1 precede all those derived from naphthol-2.

A

Ⓓ 4,6-Dichloro-2-methylphenyl acetate: m.p. 28.5°, b.p. 254° (1). [From C̄ with excess Ac_2O + a drop of conc. H_2SO_4 htd. 4 hrs. at 100° (1).]

Ⓓ 4,6-Dichloro-2-methylphenyl benzoate: m.p. 114°, b.p. 240° (1). [From C̄ with benzoyl chloride (1).]

3:1025 3-CHLORO-4-METHYLPHENOL (3-Chloro-*p*-cresol)

C_7H_7OCl Beil. VI-402, VI_1—, VI_2—

M.P. 55° (1) (2) B.P. 228° at 760 mm. (2)
229° at 735 mm. (1)

Long colorless ndls., markedly sol. in aq. and volatile with steam (1). — Eas. sol. alc., ether, or C_6H_6.

[For prepn. (77% yield) from 3-chloro-4-methylaniline [Beil. XII-988] via diazo reaction see (1).]

C̄ dislvd. in 20% NaOH and shaken with $(CH_3)_2SO_4$ gives 95% yield of corresponding methyl ether, viz., 3-chloro-4-methylanisole, b.p. 212° (1). [Oxidn. of this ether with dil. aq. $KMnO_4$ yields (1) 2-chloro-4-methoxybenzoic acid [Beil. X-175], ndls. from aq., m.p. 208° (1).]

3:1025 (1) Ullmann, Wagner, *Ann.* **355**, 367–368 (1907). (2) Badische Anilin und Soda-fabrik, Ger. 156,333, Nov. 14, 1904; *Cent.* **1904**, II 1672.

3:1040 *o*-XYLYLENE (DI)CHLORIDE (ω,ω'-Dichloro-*o*-xylene)

$C_8H_8Cl_2$ Beil. V-364, V_1—, V_2-(283)

M.P. 55° (1) (2) B.P. 239–241° (3)
54.6–54.8° (3) 130–135° at 19 mm. (2)
54–55° cor. (5)

Cryst. (from pet. eth.). — Sublimes. — Sol. alc., ether, $CHCl_3$, lgr. Powerful lachrymator.

[For prepn. from *o*-xylyleneglycol + boilg. conc. HCl see (3); from *o*-xylene (1:7430) + PCl_5 at 190° see (3) (4); from *o*-xylene (1:7430) + Cl_2 in sunlight see (1); for formn. of C̄ (13%) during chloromethylation of benzyl chloride (3:8535) see (5).]

C̄ on oxidn. with $KMnO_4$ yields phthalic ac. (1:0820).

3:1040 (1) Radziewanowski, Schramm, *Cent.* **1898**, I 1019. (2) Quelet, *Bull. soc. chim.* (4) **53**, 223 (1934). (3) Colson, *Ann. chim.* (6) **6**, 108–109 (1885). (4) Colson, Gautier, *Ann. chim.* (6) **11**, 22 (1887). (5) Kulka, *Can. J. Research* **23-B**, 107 (1945).

3:4170 3-CHLORONAPHTHOL-1  $C_{10}H_7OCl$ Beil. VI —
VI₁—
VI₂-(581

M.P. 143° (1)
134–135° (2)

Ndls. from lgr. (2), C_6H_6, alc. or 80% AcOH (1). — Volatile with steam (1).

[For prepn. of C̄ from 3-chloronaphthylamine-1 (1) via diazotization and hydrolys of the diazonium salt with steam see (1); from 2,3,4-trichloronaphthol-1 [Beil. VI-613 by partial reduction with HI ($D = 1.7$) in AcOH on boilg. 7 hrs. (100% yield) see (2)]

C̄ is sol in aq alk., and the result. soln. couples with solns. of diazonium salts (1).

C̄ with Br_2 aq. (and alk.?) gives 3-chloro-2,4-dibromonaphthol-1, pr. from 90% formic acid, m.p. 112° (1).

[C̄ in 10% aq KOH shaken with Me_2SO_4 for 20 min. gives (81% yield (2)) 3-chloronaphthol-1 methyl ether, oil, b.p. 162–164° at 18 mm. (2).]

Ⓓ **3-Chloro-1-naphthyl acetate:** ndls. from lgr., m.p. 69° (2). [From C̄ with acetyl chloride in C_6H_6 on refluxing 3 hrs. in C_6H_6 (66% yield (2)).]

Ⓓ **3-Chloro-1-naphthyl benzoate:** ndls. from lgr., m.p. 118–119° (2). [From C̄ in 10% aq. KOH on shaking with BzCl (71% yield (2)).]

3:4170 (1) Hodgson, Elliott, *J. Chem. Soc.* **1934**, 1707. (2) Franzen, Stäuble, *J. prakt. Chem.* (2) **103**, 385–387 (1922).

3:4200 2,6-DICHLOROBENZOIC ACID  $C_7H_4O_2Cl_2$ Beil. IX - 343
IX₁-(141)

M.P. 144° (1) (2)
143.7° (3)
143–144° (4)
141.5–142.5° (5)

Many recorded m.p.'s lower than these values [cf. Beil. IX-343 and (3)] were on sampl now known to have been impure.

Cryst. from lgr. (1) or mixt. of C_6H_6 + lgr. (4) (3); pr. from aq., tbls. from C_6H_6, ndl from alc. — Can also be purified by distn. in vac. (1). — Volatile with steam (?).

[For prepn. of C̄ from 2,6-dichlorotoluene (3:6270) (57% yield (4)) via brominat to 2,6-dichlorobenzyl bromide, conversion to corresp. acetate, and oxidn. of latter w $KMnO_4$ see (1) (4); from 2,6-dichlorobenzaldehyde by oxidn. with $KMnO_4$ see (2); (5 older less satisfactory methods see Beil. IX-343.]

C̄ on htg. begins to lose CO_2 at 235° (5). [C̄ htd. with a large excess 50% aq. KOH 150° for 24 hrs. was recovered unchanged to extent of 90% (9).]

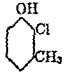
C̄ on nitration under stated conditions (1) gives 94% yield 2,6-dichloro-3-nitrobenzoi acid, cryst. from toluene, m p. 152° (1).

C̄ (as KĀ) htd. with aniline + K_2CO_3 + Cu in amyl alc. gives small yield of diphenyl aminecarboxylic acid-2, cryst. from C_6H_6, m.p. 181° (1). [Note loss of both chlorin atoms.]

C̄ htd. with acetamide for 6 hrs. at 225–235° gave 93% yield (5) *m*-dichlorobenzen (3:5960), b.p. 172°.

C̄ htd. with PCl_5 (6) or with $SOCl_2$ + pyridine (4) yields 2,6-dichlorobenzoyl chloride, b.p. 142–143° at 21 mm. (6), 126–128° at 18 mm. (7).

3:1055 2-CHLORO-3-METHYLPHENOL (2-Chloro-*m*-cresol)



C_7H_7OCl Beil. VI — VI_1— VI_2-(355)

M.P. 55–56° (1) B.P. abt. 194° (1)
49–50° (2)

Transparent cryst. (1) (2) from pet. eth. — Very spar sol cold aq.; pronounced phenolic odor (1).

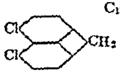
[For prepn. from *m*-cresoldisulfonic acid by chlorination see (2); from 2-nitro-3-methylphenol via 2-amino-3-methylphenol see (2), from 2-chloro-3-methylanisole by boilg. with HI see (1).]

C̄ treated with $(CH_3)_2SO_4$ + aq NaOH gives its methyl ether, 2-chloro-3-methylanisole, pr. from light pet. eth., m.p. 24.2°, b.p. 218 5° (1) [This methyl ether on oxidn. with dil. $KMnO_4$ (7¼ hrs. for 5 g.) gave (1) 2-chloro-3-methoxybenzoic acid, stout colorless rectangles, m.p. 160.5° (1), 160° (3), Neut Eq. 186 5.]

- Ⓓ *2-Chloro-3-methylphenyl benzoate: from C̄ + BzCl + pyridine, pr from alc., m.p.* 55–56° (2). [Note that this value is numerically the same as C̄ and that the deriv. must be distinguished from orig C̄, e.g., by mixed m p or behavior with alk]
- Ⓓ **2-Chloro-3-methylphenyl benzenesulfonate:** from C̄ + benzenesulfonyl chloride + pyridine; pl. from alc., m.p. 58–58 5° (2) [See note for above deriv]
- Ⓓ **2-Chloro-3-methylphenyl *p*-toluenesulfonate:** from C̄ + *p*-toluenesulfonyl chloride + pyridine; pr. from alc. m.p. 96° (2) [Note that this deriv does not distinguish C̄ from 6-chloro-3-methylphenol (3:0700) or 4-chloro-3-methylphenol (3:1535).]

3:1055 (1) Gibson, *J. Chem. Soc.* 1926, 1424–1428 (2) Huston, Chen, *J. Am. Chem. Soc.* 55, 4214–4218 (1933). (3) Hodgson, Beard, *J. Chem. Soc* 1926, 150

3:1057 4,4'-DICHLORODIPHENYL-METHANE (Di-(p-chlorophenyl)methane)



$C_{13}H_{10}Cl_2$ Beil. V - 590 V_1— V_2-(501)

M.P. 55–56°	**(1)**	**B.P. 337°** at 760.5 mm.	(5)
55°	(2) (3) (4) (5)	**186–190°** at 18 mm.	(1)
54–55°	(7)	**208–210°** at 15 mm.	(3)

Colorless ndls. from MeOH.

[For prepn. of C̄ from 4,4'-dichlorobenzophenone (3.1270) by reduction with conc. HI + red P in boilg. AcOH (4) or as by-prod of reduction with Zn dust + AcOH + dil. H_2SO_4 (5) see indic. refs ; from 4,4'-diaminodiphenylmethane [Beil XII-238, XII_1-(71)] by tetrazotization and subsequent use of Cu_2Cl_2 reaction (50% yield) see (1)]

[For prepn. of C̄ from chlorobenzene (3 7903) by action of *sym* -dichloro-dimethyl ether (3:5245) in pres. of $ZnCl_2$ (3) or better (alm 100% yield (3)) conc H_2SO_4 at 40°, or by action *in pres. of H_2SO_4 of various other formaldehyde derivs. (6), see indic. refs.; from* p-chlorobenzyl chloride (3:0220) with chlorobenzene (3 7903) + conc. H_2SO_4 (67% yield (3)) see indic. refs.]

[For prepn of C̄ from "DDT" (3 3208), from 1,1-dichloro-2,2-bis-(p-chlorophenyl)-ethylene (3:2138), or from di-(p-chlorophenyl)acetic acid (3:4612) by action of KOH in ethylene glycol refluxed 8–10 hrs. (alm. 100% yield) see (2)]

[For formn. of C̄ (21% yield) from hydrazone of 4,4′-dichlorobenzophenone (3:4270) via Wolff-Kishner reduction see (7).]

C̄ on oxidn. with CrO_3/AcOH readily gives (3) 4,4′-dichlorobenzophenone (3:4270), m.p. 145° (3).

C̄ on dinitration by addn. to 8 pts. fumg. HNO_3 (D = 1.5) with water cooling gives (1) *3,3′-dinitro-4,4′-dichlorophenylmethane*, white pl. from AcOH, m.p. 198–199° (1), 196° (3); this prod. with piperidine splits out 2 moles HCl giving (1) 3,3′-dinitro-4,4′-dipiperidinodiphenylmethane, m.p. 183–184° (1). — [Note, however, that C̄ dislvd. in 9–10 wt. pts. conc. HNO_3 (D = 1.42) and kept at 100° for 1 hr. (3) gives some of the above dinitro derivative but is also in part oxidized and nitrated (or vice versa) with formn. of 3,3′-dinitro-4,4′-dichlorobenzophenone, ndls. from alc., m.p. 132° (3); see also text of 4,4′-dichlorobenzophenone regarding nitration.]

405(

3:1058 β,β-DICHLOROPROPIONIC ACID $C_3H_4O_2Cl_2$ Beil. II-252

$Cl_2CH.CH_2.COOH$ II₁— II₂—

M.P. 56° (1)

Colorless cryst., eas. sol. aq., alc., ether, C_6H_6, or $CHCl_3$.

[For prepn. of C̄ from β-chloroacrylic acid (3:2240) by addn. of 1 HCl with 40% aq. HCl in s.t. at 80–85° for 35–40 hrs. (yield not stated) see (1).]

C̄ with alc. KOH splits out 1 HCl giving (1) β-chloroacrylic acid (3:2240).

C̄ with $SOCl_2$ at 75–80° for 3–4 hrs. gives (2) β,β-dichloropropionyl chloride (3:9032-A).

—— **Methyl β,β-dichloropropionate**: unreported.

—— **Ethyl β,β-dichloropropionate**: b.p. 171–175° (1). [From C̄ in EtOH with dry HCl (1).]

Ⓓ **β,β-Dichloropropionamide**: ndls. from $CHCl_3$, m.p. 140° (1). [From ethyl β,β-dichloropropionate (above) with conc. aq. NH_4OH on shaking at room temp. (1).]

—— **β,β-Dichloropropionanilide**: unreported.

—— **β,β-Dichloropropion-*p*-toluidide**: unreported.

3:1058 (1) Otto, *Ann.* **239**, 266–272 (1887). (2) Leimu, *Ber.* **70**, 1050 (1937).

3:1060 2,3,5-TRICHLOROBENZALDEHYDE $C_7H_3OCl_3$ Beil. S.N. 635

M.P. 56° (1)

Colorless ndls. (from dil. alc.) with characteristic pungent odor. — Volatile with steam. — [Note that a patent abstract gives m.p. as 75–76° (2).]

[For prepn. of C̄ from 3-amino-2,5-dichlorobenzaldehyde (presumably by diazotization and use of Cu_2Cl_2 reaction) see (1).]

C̄ on oxidn. with neutral $KMnO_4$ gives (1) 2,3,5-trichlorobenzoic acid (3:4485), m.p. 162–163°.

C̄ with PCl_5 should give 2,3,5-trichlorobenzal (di)chloride, but this compd. is unreported in the literature.

—— **2,3,5-Trichlorobenzaldoxime:** unreported.
—— **2,3,5-Trichlorobenzaldehyde phenylhydrazone:** unreported.
—— **2,3,5-Trichlorobenzaldehyde *p*-nitrophenylhydrazone:** unreported.
—— **2,3,5-Trichlorobenzaldehyde 2,4-dinitrophenylhydrazone:** unreported.

3:1085 DICHLOROACETALDEHYDE HYDRATE  $C_2H_4O_2Cl_2$ Beil. I-614 I_1— I_2—

M.P. 56–57° (1) (4) **B.P.** 118–121° (1)
55–56° (2) 96–97.5° (2)

Cryst. from C_6H_6 (3). — Eas. sol. aq or ether; sol. CS_2.

[For prepn. of C̄ from dichloroacetaldehyde (3:5180) with a limited amt. of cold aq. see (2); for formn. of C̄ from α,β,β-trichloroethyl ethyl ether with aq. see (2); for formn. of C̄ as by-product of actn. of Cl_2 on paraldehyde in prepn. of butyrchloral (3:5910) see (2); for formn. of C̄ from chloral hydrate with Al/Hg + aq. see (5).]

C̄ with conc. H_2SO_4 yields (3) dichloroacetaldehyde (3:5180), b.p 89°.

3:1085 (1) Denaro, *Gazz. chim. ital.* **14**, 119–120 (1884). (2) Oddo, Mameli, *Gazz chim. ital.* **33**, II 398–399 (1903). (3) Friedrich, *Ann* **206**, 251–254 (1880). (4) Ingold, *J. Chem. Soc.* **125**, 1537 (1924). (5) Deodhar, *J. Indian Chem. Soc.* **11**, 84 (1934).

3:1100 2-CHLOROBENZOQUINONE-1,4 (Chloroquinone)  $C_6H_3O_2Cl$ Beil. VII-630 VII_1-(346)

M.P. 57° (1) (2) (3) (4) (5) (6) (7) (14) (15)
56.0–56.5° cor. (8)
56° (9)
55–57° (10)
54° (11)

[See *also 2-chlorohydroquinone* (3:3130).]

Pale yel. cryst.; eas. sol. aq., alc., ether, $CHCl_3$. — Volatile even at ord. tem. — Gradually dec. by light (3) (for study of photochem decompn. in alc. see (12)). — Sol. in conc. H_2SO_4 on warming with brown black color.

[For prepn. of C̄ from 2-chlorohydroquinone (3:3130) by oxidn. with $NaClO_3$ + H_2SO_4 + V_2O_5 in AcOH (92% yield (13)), with $K_2Cr_2O_7$ + H_2SO_4 (yield: 89% (14), 84% (1)) (7), with MnO_2 + dil. H_2SO_4 (56% yield (1)), or with PbO_2 in C_6H_6 (2) see indic. refs: from 2-chloro-4-aminophenol [Beil. XIII-510, $XIII_1$-(181)] by oxidn. with $K_2Cr_2O_7$ +

H_2SO_4 (68% yield (8)) (10) (15) see indic. refs.; from benzoquinone-1,4 (1:9025) in CCl_4 with ⅓ mole HCl gas see (9); for formn. of C̄ (together with other prods.) from oxidn. of copper salt of quinic acid [Beil. X-535, X_1-(270)] with MnO_2, NaCl + dil. H_2SO_4 see (16)]

[For use of C̄ as vulcanization accelerator see (17); for use as seed disinfectant see (18); for study of bactericidal action see (19).]

C̄ on reductn. with aq. SO_2 gives *(16) (7) 2-chlorohydroquinone (3:3130)* (note, however, that C̄ in dil. aq. NaOH under N_2 with SO_2 is in part reduced to 2-chlorohydroquinone and in part sulfonated (20)). [For studies on oxidn.-reductn. potential of system C̄ + 2-chlorohydroquinone (3:3130) see (1) (2) (3) (21) (22) (23) (24).] — [C̄ with 2-chlorohydroquinone (3:3130) yields (1) (16) (25) the corresp. quinhydrone, monohydrate, violet pr. with green shimmer, m.p. 70–72° (25), anhydrous form, m.p. 93–94° (25), 67° (1); C̄ with hydroquinone (1:1590) gives (25) (6) corresp. quinhydrone, dark green ndls. from alc., m.p. 132–133° (25), 130–135° (6).]

[C̄ in $CHCl_3$ with HCl gas (7) (26) or C̄ with hot conc. HCl (83% yield (10)) gives only 2,5-dichlorohydroquinone (3:4690), but C̄ in ether with HCl gas (26) or C̄ dislvd. in cold dil. HCl ($D = 1.10$) (26) gives both 2,3-dichlorohydroquinone (3:4220) and 2,5-dichlorohydroquinone (3:4690); C̄ refluxed with conc. HBr gives (27) 2-chloro-5-bromohydroquinone [Beil. VI-853], ndls m.p. 171–172° (28) (diacetate, m.p. 145–146° (28)); C̄ in alc. with KCN + H_2SO_4 *gives in good yield (29) 3,6-dihydroxyphthalonitrile (2,3-dicyanohydroquinone)* [Beil. X-551]]

[C̄ with Ac_2O + trace H_2SO_4 yields (29) a chloro-hydroxyhydroquinone triacetate, ndls. from alc., m.p. 96–97° (29); C̄ with AcCl gives (28) 2,5-dichlorohydroquinone diacetate, m.p. 141°; C̄ with AcBr gives (28) 2-chloro-5-bromohydroquinone diacetate, m.p. 145–146° (28)]

[C̄ with 2,3-dimethylbutadiene-1,3 (1:8050) gives an adduct which upon oxidn. yields (30) 2-chloro-6,7-dimethylnaphthoquinone-1,4; for reactn. of C̄ with diazotized aniline see (31); for addn. prods. of C̄ with hexamethylbenzene (1:7265) see (5).]

[C̄ in alc. or AcOH on warming with aniline gives (32) 2,5-dianilinobenzoquinone-1,4 [Beil. XIV-138, $XIII_1$-(413)], red-br. scales, m.p. 345° u.c.]

[C̄ in dil. alc. with $NH_2OH.HCl$ as directed (33) gives 2-chlorobenzoquinone-1,4-monoxime-4 (purified (with difficulty) by conv. to the mixt. of stereoisomeric oxime acetates followed by hydrolysis), m.p. 142° (34), 148° dec. (35); this prod. by special treatment yields a dioxime [Beil. VII-632].]

C̄ in cold dil. alc with semicarbazide HCl gives (36) 2-chlorobenzoquinone-1,4-semicarbazone-4, deep yel. cryst. from acetone + pet. ether, m.p. 185° dec. (36); this prod. on boilg. with dil. aq. NaOH yields *o*-chlorophenol (3:5980) + N_2 + CO_2 + NH_3 (36); C̄ does not give a *bis*-semicarbazone (36).

3:1115 β-CHLOROETHYL PHENYL KETONE C_9H_9OCl **Beil. VII - 302**
(β-Chloropropiophenone) **VII₁-(161)**

M.P. 57–58° (1)
57° (2)
55–56° (3)

49–50° (4) (5)
49° (3)

See text.

Lfts. from pet. ether (5), alc. (1) (5), or ether (2), eas. sol. in org. solv. except lgr. — C̄ on distn. even under reduced press. loses HCl with partial conversion (2) to phenyl vinyl ketone; nevertheless in small amts. of less than 10 g C̄ may be distd below 2 mm (3); in general, however, unnecessary htg of C̄ should be avoided (4).

[For prepn. of C̄ from β-chloropropionyl chloride (3 5690) with C_6H_6 + $AlCl_3$ (yield: 90% (1), 80–90% (6), 65% (5)) see indic. refs. (note, however, that this method is best suited for small runs (6) since with large units much ω-benzylacetophenone [Beil. VII-444, VII_1-(237)], m p. 72°, is also formed (6) (4); furthermore that C̄ prepd by this method melts at 49° even when white, unless it is treated with decolorizing carbon (3), for prepn. from benzoyl chloride (3:6240) + ethylene + $AlCl_3$ (87–92% yield) in special apparatus see (3); for prepn. of C̄ from phenyl vinyl ketone + HCl gas in dry ether see (2); for formn. of C̄ from ethyl phenyl ketone (propiophenone) (1·5525) + Cl_2 see (7)]

[C̄ htd 15–30 min. in AcOH with 1½ moles NaOAc or KOAc, then poured into aq. and neutralized with K_2CO_3, gives (8) β-acetoxypropiophenone, lfts from MeOH, m.p. 53–54° (8); C̄ in hot alc. treated with KOAc, then with aq. NaCN, gives (65% yield (9)) β-cyanopropiophenone, lfts. from alc., m.p. 76° (2,4-dinitrophenylhydrazone, m p. 141°; corresp. β-benzoylpropionic acid, m.p. 116° (9))]

[C̄ under certain circumstances reacts as potential phenyl vinyl ketone: e.g., C̄ + KOAc in hot MeOH treated with phenyl-nitromethane + NaOMe gives (82% yield (10)) (presumably t
C_6H_6 + p
with desox
1,5, m p. 95° (monoxime, m.p. 131°; dioxime, m p. 162°; 2,4-dinitrophenylhydrazone, m p. 221°) (6)]

C̄ in AcOH reduced with H_2 + Adams cat gives (11) 3-chloro-1-phenylpropanol-1, b p 130–132° at 8 mm. (p-nitrobenzoate, m.p. 62–63°) (11).

[For study of rate of reactn. of C̄ with KI in acetone see (5), for study of C̄ with Na + liq NH_3 see (12); for behavior of C̄ with anthrone see (13) (14) (15); for reactn of C̄ with C_6H_5MgBr yielding ω-benzylacetophenone (β-phenylpropiophenone) (cf. above) see

(16) (2); for reactn. of C̄ with sodium benzenesulfinate giving (68% yield) β-(benzenesulfonyl)propiophenone, m.p. 98° see (17).]

C̄ htd. with aq. + aniline for 30 min. at 100° gives (4) β-anilinopropiophenone, pl. from alc., m.p. 111–112° (4); note, however, that C̄ htd. with aniline + aniline HCl yields (4) 4-phenylquinoline.

[C̄ in MeOH boiled 3 hrs. with hydrazine hydrate (87%) gives (28% yield (18)) 3-phenylpyrazoline-2, b.p. 164° at 17 mm., m.p. 44–45° (18) (1-nitroso deriv., m.p. 152.5–153.5°; *1-carbomethoxy deriv., m.p. 123–124°; 1-carbethoxy deriv., m.p. 72°) (18).* — C̄ (or phenyl vinyl ketone) with phenylhydrazine yields by ring closure (19) 1,3-diphenylpyrazoline-2 [Beil. XXIII-153], m.p. 152–153° (19).]

[C̄ htd. in alc. with $NH_2OH.HCl$ + NaOH gives very small yield (8) corresp. oxime, m.p. 56–58°; from the mother liquor, however, is obtd. (8) as a result of ring closure 3-phenylisoxazoline, tbls. from lgr. m.p. 66–67°, which is the sole product starting from β-acetoxypropiophenone (above); another by-product of oximation is *N,N-bis*-(β-benzoylethyl)hydroxylamine dioxime, m.p. 154–155° (8).]

- Ⓓ **β-(Phthalimido)propiophenone:** cryst. from alc., m.p. 130° (1). [From C̄ + K phthalimide in 68% yield on htg. in s.t. for 1 hr. at 130–140° (1); on hydrolysis with fumg. HCl in AcOH in s.t. at 145–150° for 1 hr. this prod. gives 95% yield (1) β-aminopropiophenone hydrochloride, cryst. from abs. alc., m.p. 128° (1).]
- Ⓓ **1-Methyl-3-carbohydrazidopyridinium *p*-toluenesulfonate:** cryst. from alc., m.p. 171° cor. (20). [From *C̄ +* nicotinic *hydrazide/methyl p-toluenesulfonate addn.* prod. as directed (20).]

3:1130 *p*-METHYLPHENACYL CHLORIDE C_9H_9OCl Beil. VII - 309

(Chloromethyl *p*-tolyl ketone, ω-chloro-*p*-methylacetophenone) VII₁-(165)

M.P.	57–58° (1) (5)	B.P.	260–263°	(2)
	55.5–56° (2) (3)		260–265° sl. dec.	(3)
	54.5–55° (4)		113° at 4 mm.	(4)

Ndls. from alc.; eas. sol. alc., ether.

[For prepn. from toluene (1:7405) + chloroacetyl chloride (3:5235) + $AlCl_3$ see (2) (3); from toluene + chloroacetic acid anhydride (3:0730) + $AlCl_3$ (46–59% yield) see (4).]

C̄ on oxidn. with alk. $KMnO_4$ gives terephthalic ac. (1:0910) (2).

C̄ with NaI in acetone gives *p*-methylphenacyl iodide, ndls. from alc., m.p. 42–43° (11).

C̄ refluxed with alc. KOAc yields (2) *p*-methylphenacyl acetate [Beil. VIII-113], ndls from alc., m.p. 83–83.5° (2), 85–86° (1).

C̄ dislvd. in alc. warmed at 60° with $Na_2S.9H_2O$ dislvd. in aq. gives (5) (73% yield (6)) *bis*-(*p*-methylphenacyl)sulfide, pale yel. ndls. from alc., m.p. 88° (5); 88.8–89.3° (6). [For detn. of C̄ by titration of residual chloride ion from this reaction see (5).]

[For reactions of C̄ with phenol + KOH + Cu see (7); with phenyl-*p*-bromophenyl-, *p*-nitrophenyl-, *o*-tolyl-, and *p*-tolyl-hydrazines see (5); with Br_2 see (8); with KCN or KSCN see (9); with alc. NaOEt see (10).]

3:1145 2,5-DICHLOROBENZALDEHYDE $C_7H_4OCl_2$ Beil. VII -237 VII₁—

M.P. 58° (1)	**B.P. 231–233° (1)**
57–58° (2) (4)	**230–233° (2)**
57° (3)	

Ndls. from alc. (4). — Very eas. sol. alc., ether, $CHCl_3$, C_6H_6, CS_2, AcOH (4). — Eas. volatile with steam (4). — Sol. in conc. H_2SO_4 with olive-yel. color; repptd. in cryst. form on dilution (4) (8).

[For prepn. of C̄ from benzaldehyde (1:0195) by chlorination in presence of $SbCl_5$ + I_2 see (5) (1) (9); from 2,5-dichlorotoluene (3:6245) by chlorination to 2,5-dichlorobenzal (di)chloride (3:0490) (m.p. 42°) and hydrolysis of the latter with $CaCO_3$ + H_2O see (1); from 5-nitro-2-chlorobenzaldehyde via reduction to 5-amino-2-chlorobenzaldehyde followed by diazotization + use of CuCl see (6).]

C̄ with satd. aq. $NaHSO_3$ soln. yields a cpd., C̄.$NaHSO_3$ (5), ndls. fairly eas. sol. aq. but dissociating on warming into C̄ + aq. (5).

C̄ on oxidn. with $KMnO_4$ (2) (4) yields 2,5-dichlorobenzoic ac (3:4340), m p. 152° (2), 152–153° (4). — C̄ with 50% aq. KOH (5) (1) (6) undergoes Cannizzaro reactn. giving (90% yield (6)) 2,5-dichlorobenzyl alc., cryst. from C_6H_6, m.p. 80° (1) (6), and (84% yield (7)) 2,5-dichlorobenzoic ac. (3:4340), cryst. from aq , m.p. 155° (5) (7). — C̄ on reductn. with 4% Na/Hg in alc. yields (1) 2,5-dichlorobenzyl alc., m p. 80° (1).

C̄ with PCl_5 (3) gives (78% yield (3)) 2,5-dichlorobenzal (di)chloride (3:0490), b.p. 118–120° at 14 mm , m p. 42° (8), 43° (3).

C̄ on mononitration as specified (5) gives (100% yield (9)) a mixt. of two isomers; by recrystallization from MeOH (9) or EtOH (5) this mixt. gives (62% yield (9)) 2,5-dichloro-6-nitrobenzaldehyde, lfts. or ndls., m.p. 137° (5); the other more soluble isomer is 2,5-dichloro-3-nitrobenzaldehyde (10), m.p. 66 5–67° (5). [The latter yields a phenylhydrazone, or. ndls , m p. 171°, a *p*-nitrophenylhydrazone, deep or. ndls , m p. 290–292° dec., and on oxidn. with alk. $KMnO_4$ yields 2,5-dichloro-3-nitrobenzoic ac., colorless ndls. from AcOH, m p 220° (10)]

[For conversion of C̄ to 2,5-dichlorostyrene (12) (13) via reaction with MeMgX giving (83% yield (12)) 2,5-dichlorophenyl-methyl-carbinol and dehydration of latter with $KHSO_4$ (37% yield (12)) see indic. refs.]

Binary Systems Contg. $\bar{C}$

Azeotropic Systems

[$\bar{C}$ with pentachloroethane (3:5880) forms a const.-boilg. mixt., b.p. 161.8° at 760 mm., contg. 3.5 wt. % $\bar{C}$ (25); $\bar{C}$ with *p*-dichlorobenzene (3:0980) forms a const.-boilg. mixt., b.p. 174.0° at 760 mm., contg. about 12 wt. % $\bar{C}$ (26); C with *o*-bromotoluene forms a const.-boilg. mixt., b.p. 180.0° at 760 mm., contg. about 18 wt. % $\bar{C}$ (26).]

Other Physical Data on Binary Systems Contg. $\bar{C}$

$\bar{C}$ + aq. [$\bar{C}$ is eas. sol. aq.; for study of hydration at −35° see (70) cf. (34); for f.p./compn. data see (3); for data on D^{20}_{20} (31) and D^{25}_{25} (71) of aq. solns. see indic. refs.; for n^{18}_{D} (8), n^{20}_{D} (31) cf. (73) see indic. refs.]

$\bar{C}$ + H_2SO_4. [For f.p./compn. data and diagram (no compd. formed) see (10).]

$\bar{C}$ + H_3PO_3. [For f.p./compn. data and diagram (no compd. formed) see (12).]

$\bar{C}$ + AcOH (1:1010). [For f.p./compn. data (no cpd.) (74), D^{25}_{4} (2), viscosity (2), and conductivity (1) see indic. refs.]

$\bar{C}$ + chloroacetic acid (3:1370). [For f.p./compn. data (74), eutectic, m.p. 17.5°, contg. 51.5 mole % $\bar{C}$ (75), see indic. refs.]

$\bar{C}$ + dichloroacetic acid (3:6208). [For f.p./compn. data (74), eutectic, m.p. −11.0°, contg. 36 mole % $\bar{C}$ (75), see indic. refs.]

$\bar{C}$ + miscellaneous cpds. of Order 1. [For f.p./compn. data on following systems see indic. refs.]

$\bar{C}$ with hydrocarbons: $\bar{C}$ + C_6H_6 (1:7400) (5); *$\bar{C}$ + camphene* (76).

$\bar{C}$ with alcohols: $\bar{C}$ + EtOH (1:6130) (14); *$\bar{C}$ + ter-BuOH* (1:6140) (14); *$\bar{C}$ + cetyl alc.* (1:5945) (14); *$\bar{C}$ + d-borneol* (1:5990) (14); *C + l-menthol* (1:5940) (14); *$\bar{C}$ + pinacol* (1:5805) (14); *$\bar{C}$ + meso-erythritol* (1:5825) (6); *$\bar{C}$ + d-mannitol* (1:5830) (14).

$\bar{C}$ with phenols: $\bar{C}$ + phenol (1:1420) (14) (11); *$\bar{C}$ + o-cresol* (1:1400) (11); *$\bar{C}$ + m-cresol* (1:1730) (11); *$\bar{C}$ + p-cresol* (1:1410) (11); *$\bar{C}$ + guaiacol* (1:1405) (14); *$\bar{C}$ + thymol* (1:1430) (11); *$\bar{C}$ + α-naphthol* (1:1500) (11); *$\bar{C}$ + β-naphthol* (1:1540) (11); *$\bar{C}$ + hydroquinone* (1:1590) (14).

$\bar{C}$ with aldehydes: $\bar{C}$ + benzaldehyde (1:0195) (7); *$\bar{C}$ + salicylaldehyde* (1:0205) (7); *$\bar{C}$ + m-hydroxybenzaldehyde* (1:0055) (7); *$\bar{C}$ + p-hydroxybenzaldehyde* (1:0060) (7); *$\bar{C}$ + p-anisaldehyde* (1:0240) (7); *$\bar{C}$ + vanillin* (1:0050) (7); *$\bar{C}$ + piperonal* (1:0010) (7).

$\bar{C}$ with ketones: $\bar{C}$ + acetophenone (1:5515) (7); *$\bar{C}$ + benzophenone* (1:5150) (7); *$\bar{C}$ + p-methoxybenzophenone* (1:5170) (7); *$\bar{C}$ + benzil* (1:9015) (7); *$\bar{C}$ + dibenzalacetone* (1:9024) (7); *$\bar{C}$ + benzoquinone-1,4* (1:9025) (7).

$\bar{C}$ with acids: $\bar{C}$ + acetic acid (1:1010) (74); *$\bar{C}$ + benzoic acid* (1:0715) (74); *$\bar{C}$ + o-toluic acid* (1:0690) (74); *$\bar{C}$ + m-toluic acid* (1:0705) (74); *$\bar{C}$ + p-toluic acid* (1:0795) (74); *$\bar{C}$ + phenylacetic acid* (1:0665) (74); *$\bar{C}$ + cinnamic acid* (1:0735) (74); *$\bar{C}$ + crotonic acid* (1:0425) (74).

$\bar{C}$ with esters: $\bar{C}$ + EtOAc (1:3015) (5); *$\bar{C}$ + α-naphthyl acetate* (1:2124) (5); *$\bar{C}$ + β-naphthyl acetate* (1:2273) (5); *$\bar{C}$ + methyl benzoate* (1:3586) (5); *$\bar{C}$ + ethyl benzoate* (1:3721) (5); *$\bar{C}$ + benzyl benzoate* (1:4422) (5); *$\bar{C}$ + phenyl benzoate* (1:2257) (5); *$\bar{C}$ + methyl cinnamate* (1:2090) (5); *$\bar{C}$ + phenyl salicylate ("Salol")* (1:1415) (5); various others (5).

$\bar{C}$ with ethers: $\bar{C}$ + diethyl ether (1:6110) (77); *$\bar{C}$ + veratrole* (1:7560) (14).

$\bar{C}$ + compounds of Order 2. *$\bar{C}$ + o-nitrophenol* (11); *$\bar{C}$ + m-nitrophenol* (11); *$\bar{C}$ + p-nitrophenol* (11); *$\bar{C}$ + o-nitrobenzaldehyde* (7); *$\bar{C}$ + m-nitrobenzaldehyde* (7); *$\bar{C}$ + p-nitrobenzaldehyde* (7); *$\bar{C}$ + nitropiperonal* (7); *$\bar{C}$ + azobenzene* (78); *$\bar{C}$ + ethyl carbamate (urethane)* (16); *$\bar{C}$ + urea* (78A).

BIOCHEMICAL ASPECTS OF $\bar{C}$

[For study of toxicity of $\bar{C}$ see (79); for study of bactericidal effect see (80) (81).]

PREPARATION OF $\bar{C}$

From chloral (anhydrous). [For prepn. of $\bar{C}$ from chloral (3:5210) by oxidn. with fumg. HNO_3 (82) (83) (84), with HNO_2 (85), with NO_2 at 40–60° (70% yield (86)), or with aq. chlorates + cat. see (312); for formn. of $\bar{C}$ from chloral as by prod. of oxidn. with O_2 see (23).]

From chloral hydrate. [For prepn. of $\bar{C}$ from chloral hydrate (3:1270) by oxidn. with fumg. HNO_3 (63% yield (82)) (85), with $KMnO_4$ (88), with $KClO_3$ (89), with $Ca(OCl)_2$ (15), or with aq. chlorates + cat. (312) see indic. refs.]

From acetic acid. [For formn. (first discovery) of $\bar{C}$ from acetic acid (1:1010) by chlorination with Cl_2 in sunlight see (90).]

From tetrachloroethylene. [For formn. of $\bar{C}$ from tetrachloroethylene (3:5460) by stdg. in aq. in light for 4 months see (91) cf. (92); for many other methods see text of tetrachloroethylene (3:5460) under oxidation.]

From miscellaneous sources. [For formn. of $\bar{C}$ from pentachloroethyl chloroformate [Beil. III-13, III_1-(6)] with aq. on htg. (93), but yield is small (94) owing to other modes of reaction (94); from pentachloroethyl trichloroacetate [Beil. II-210] with aq. (95); from trichloroacetyl chloride (3:5420) (96) or from trichloroacetic acid anhydride (3:6575) (97) (98) with aq.; from β,β,β-trichloroethyl alcohol (3:5775) by oxidn. with fumg. HNO_3 (210), see indic. refs.]

CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis of $\bar{C}$

(See also below under decarboxylation.) Pure $\bar{C}$ shows no tendency to decompose at its b.p. (99). — [However, $\bar{C}$ in presence of pumice begins to decompose about 180° giving (99) HCl, $COCl_2$ (3:5000), CO + CO_2. — $\bar{C}$ in presence of ThO_2 begins to decompose at 160–165° giving (99) the same products, although $\bar{C}$ in presence of ThO_2 above 210° (100) or in presence of kaolin above 230° (100) gives $CHCl_3$ (3:5050), tetrachloroethylene (3:5460), hexachloroethane (3:4835), HCl, CO + CO_2. — $\bar{C}$ in presence of animal charcoal at 135° gives (99) $CHCl_3$ (3:5050) + CO_2, but at 200–300° these are accompanied (100) by a little tetrachloroethylene (3:5460), hexachloroethane (3:4835), HCl, and CO. — $\bar{C}$ at 300° in s.t. for 4 hrs. gives (101) trichloroacetyl chloride (3:5420), CO, CO_2 + HCl.

Reduction of $\bar{C}$

[$\bar{C}$ on partial reduction with Zn + aq. (102), with Cu pwdr. in aq. (103), with Cu pwdr. in C_6H_6 + aniline (104) cf. (105), or $\bar{C}$ on electrolytic reduction (106) gives (yields: 80% (103) (106), 75–85% (104)) dichloroacetic acid (3:6208).]

[$\bar{C}$ on complete reduction with HI at 100° (87), or in aq. soln. with K/Hg (107) (84), or by electrolytic reduction with Pt, Cu, or Pb electrodes (108) gives acetic acid (1:1010).]

[$\bar{C}$ in aq. alc. KOH with H_2/Pd gives up all its chlorine as HCl (109) presumably yielding AcOH (1:1010).]

Reactions Involving the —COOH Group of $\bar{C}$

Decarboxylation of $\bar{C}$

$\bar{C}$ in aq., in aq. alkalies, or in aniline or other organic bases undergoes cleavage into $CHCl_3$ (3:5050) + CO_2; for this decompn. presence of the trichloroacetate ion appears

necessary since in relatively nonbasic solvents it does not occur [e.g., C̄ does not decompose at 25° in C_6H_6 (110), toluene (111), $CHCl_3$ (110) (111), CCl_4 (110), CS_2 (110), isoamyl alc. (117), acetone (110), ether (110), ethyl acetate (117), ethyl benzoate (110), acetic acid (117), nitrobenzene (110), or 6 N H_2SO_4 (117); in MeOH (111) and in EtOH (111) (112) the only reaction is esterification (see below)].

The decompn. of C̄ into $CHCl_3$ + CO_2 by boiling with aq. or aq. alk. has long been known (90) (113) (114) (115), and KCN behaves similarly (116). — [For studies on kinetics of decompn. of C̄ in aq. at various temps. see (4) (118) (119) (103) cf. (120); note that rate of decompn. is catalyzed by light (111) (119) (121) (122). — For studies of decompn. of aq. solns. of various salts (117) (123) (124) (125) and influence of light (126) (127) or of presence of various other inorganic salts (128) see indic. refs. — For studies of decompn. of C̄ in aqueous dioxane see (129). — Note that C̄ with $Ca(OH)_2$ on htg. gives $CHCl_3$ and that this reaction has been patented (134).]

[For study of decompn. of C̄ in aniline (117) (111) (130) (131) including influence of supersonic waves (132) see indic. refs.; for decompn. of C̄ in tertiary bases such as dimethylaniline see (133) but note in C̄ does not decompose in pyridine (111).]

[C̄ on htg. in resorcinol or cresol gives (135) $CHCl_3$ + CO_2, but C̄ on htg. in phenol or thymol decomposes differently yielding (135) (136) phosgene (3:5000) + HCl + CO.]

[Note that, as a consequence of the decompn. of C̄ into $CHCl_3$ + CO_2, it has been employed in Reimer-Tiemann types of condensation: e.g., C̄ with phenol + aq. NaOH gives o-hydroxybenzaldehyde (1:0205) + p-hydroxybenzaldehyde (1:0060) (137) (138); many other phenols have also been studied (137) (138).]

Acid Strength of C̄

C̄ in aq. soln. behaves as an exceedingly strong monobasic acid; Neut. Eq. = 163.4 (found 164.6 (91)). — [Ionization constant of C̄ in aq. soln. at 25° is about 1.2 (139) cf. (140), but because of strength of C̄ and its tendency to decompn. (see above) no accurate value is available (143). — For discussion of resonance and acid strength of C̄ see (141) (142) (143). — For studies of electrical conductivity of C̄ in aq. solns. at various temps. see (144) (145) (146) (147) (30).]

[Studies of acid strength of C̄ in nonaqueous solvents include the following: in EtOH (148) (149), in n-BuOH (150) (13), in ether (151), in $CHCl_3$ (151), in formamide (152), in C_6H_6 (153), in chlorobenzene (154), or in dioxane (155). — For study of electrometric titration of C̄ in C_6H_6 (156), in ethylene glycol monomethyl ether ("methylcellosolve") (157), in anisole-n butyl alc. (157), see indic. refs. — For titration of C̄ in Ac_2O soln. with NaOAc see (158) cf. (310). — For study of behavior of C̄ with indicators in C_6H_6 soln. see (159) (160).]

Catalytic Effect of C̄ on Various Reactions

The catalytic influence of C̄ upon diversified types of chem. reactions has been extensively examined; although this matter cannot be recorded exhaustively, the following examples are cited.

[For studies on catalytic effect of C̄ upon the inversion of l-menthone to d-isomenthone in C_6H_6 (161) (162) or in chlorobenzene (163); upon racemization of methyl-phenyl-acetophenone and of isobutyl-phenyl-acetophenone in various solvents (164); of isopulegone to pulegone in nonaqueous solvents (165); or on hydrogen disproportionation of d-limonene (311), see indic. refs.]

[For studies of catalytic effect of C̄ upon the hydrolysis of EtOAc (144) or of sucrose (166) (167) see indic. refs.]

[For studies of catalytic effect of C̄ upon formn. of ether from EtOH (168); upon rate

of esterification of various org. acids in MeOH (169) or in EtOH (170); upon nitration of toluene (171) cf. (172); upon decompn. of ethyl diazoacetate in C_6H_6 (162) or other solvents (173) (174) (175); upon decompn of nitramide in iso-AmOH (176); upon rearr of N-chloroacetanilide (177); upon rearr. of N-bromoacetanilide in chlorobenzene (178) (179) or in other solvents (179); upon rearr. of N-bromobenzanilide in chlorobenzene (180), upon chromate or perchlorate oxidn. of EtOH (181); upon addition of HBr to 3-methylbutene-1 (182), see indic. refs.

Salts of $\bar{C}$

This topic cannot here be treated exhaustively but the following examples are cited.

Salts with inorganic bases. [$NH_4\bar{A}$, prepn. (183), $NH_4\bar{A}$ $\bar{C}$ (184) (185); $2NH_4\bar{A}.5H_2O$ (186). — Hydroxylamine salt, $HONH_3\bar{A}$, cryst. from dry ether by pptn with lgr., m.p. 133–134° (187).]

[$Li\bar{A}$, n_D^{18} of aq. solns. (8), nonhygroscopic cpds. with betaine or pyridine betaine (188); $Li\bar{A}.2H_2O$ (189), *conductivity of aq. solns* (190). — $Na\bar{A}$ (198), effect of dry distillation (191), conductivity in aq. (190) (192), in dry MeOH (193), in dry EtOH (194); n_D^{18} of aq. solns. (8); $Na\bar{A}.3H_2O$ (196). — $K\bar{A}.H_2O$ (189) (198), solubility and decompn. (197); $K\bar{A}.C$ (184) (185).]

[$Ag\bar{A}$, spar. sol. aq., darkens in air; on dry htg decomposes above 80° (199) yielding (198) AgCl, CO, CO_2, and trichloroacetic acid anhydride (3 6575); with boilg. aq. $Ag\bar{A}$ yields (198) AgCl, CO, CO_2, $CHCl_3$ (3:5050), and $\bar{C}$, for behavior of $Ag\bar{A}$ with I_2 in C_6H_6 see (200). — $Hg\bar{A}$, ndls. from aq in which it is spar sol. (201) (202) (203) (209) (note that it is soluble in C_6H_6 (202)). — $Hg\bar{A}_2$, attempts to prepare this mercuric salt have been unsuccessful (201) (204); aq. solns. of $\bar{C}$ react with HgO long after theoretical amt. has been used (201), and CO, CO_2, and $CHCl_3$ are also formed (205)]

[$Mg\bar{A}_2.4H_2O$ (189). — $Ca\bar{A}_2.6H_2O$ (196); $Ca\bar{A}_2.3\frac{1}{2}H_2O$, eas. sol. (198). — $Sr\bar{A}_2.6H_2O$ (196). — $Ba\bar{A}_2.6H_2O$ (196); $Ba\bar{A}_2.2H_2O$ (206) — $Be\bar{A}_2.2H_2O$ (207) (206). — $Cd\bar{A}_2$ (208); $Cd\bar{A}_2.1\frac{1}{2}H_2O$ (217). — $Zn\bar{A}_2.6H_2O$ (209) — $Pb\bar{A}_2.\frac{1}{2}H_2O$ (210); $Pb\bar{A}_2.H_2O$ (83) — $Cu\bar{A}_2.6H_2O$ (83) (could not be confirmed (201) (211)), $Cu\bar{A}_2.4H_2O$ (211); $Cu\bar{A}_2.3H_2O$ (201) (complexes with benzylamine (212)); $Cu\bar{A}_2.2H_2O$ (complexes with various amines (213)); $Cu\bar{A}_2$ (201) (complexes with various amines (213) (214)), electrolysis (215), electrometric titration (216).]

[$Mn\bar{A}_2.3\frac{1}{2}H_2O$ (217). — $Co\bar{A}_2.4H_2O$ (218) (complexes with various amines (218) (219)); $Co\bar{A}_2.3\frac{1}{2}H_2O$ (217). — $Ni\bar{A}_2.4H_2O$ (189) (218) (complexes with NH_3 (211) and various amines (220)).]

Salts with organic bases. [*Aniline trichloroacetate*, from $\bar{C}$ (1 mole) + aniline (1 mole) in C_6H_6 (223) (224), *or without solvent* (225), *or in aq* (226); *this salt has no true m.p.* (224) although various values ranging from 145° (226) to 163° (225) have been reported. — Note that, although action of heat would be expected to cause loss of H_2O giving ω,ω,ω-trichloroacetanilide (see below), no actual study has been reported. — Note that $\bar{C}$ + aniline + Cu powder in C_6H_6 soln. gives dichloroacetic acid (3 6208) (75–85% yield (223) cf. (227)). — Note finally the existence of *an acid salt of $\bar{C}$ with aniline*, m p. 107–108° (224), from $\bar{C}$ (2 moles) with aniline (1 mole). — *o-Toluidine trichloroacetate;* the prepn. of this salt, m p. 167–168° dec (225), has been claimed (225) but could not be confirmed (224) (228); no other record of it can be found — *p-Toluidine trichloroacetate;* the prepn. of this salt, m p. 135° dec. (225), has been claimed (225) but could not be confirmed (224) (228); *no other record of it can be found — N-Methylaniline trichloroacetate:* m p. 97° (228)]

o-Phenylethylamine trichloroacetate: unreported. — *Benzylamine trichloroacetate:* from $\bar{C}$ + benzylamine in EtOAc, m.p. 118.8–119 8° u c , 120 3–121.3° cor. (229) (note that this

m.p. is practically identical with corresp. benzylamine salt of chloroacetic acid (3:1370) q.v.). — *Piperazine bis-(trichloroacetate)*, m.p. 121.0–121.5° cor. (230). — *Semicarbazide trichloroacetate:* m.p. 154° dec. (231).

[*Phenylhydrazine trichloroacetate:* from C̄ with phenylhydrazine in C_6H_6, m.p. 123° (232). (Note that this product is definitely the salt since on titration with alk. it gives Neut. Eq. 204.7 as against a calcd. value of 202.6 (232); this salt upon htg. would be expected to lose H_2O giving trichloroacetophenylhydrazide, but this product is unreported.)]

[For salts of C̄ with *o*-, *m*-, and *p*-phenylenediamines see (233).]

Behavior of C̄ with Metals

[C̄ with aq. + Zn wool (102), or C̄ with Cu powder in aq. or C_6H_6 (223) (103) (227), gives dichloroacetic acid (3:6208) q.v. — C̄ in conc. NH_4OH dissolves Cu, Zn, or Cd with strong evoln. of ht. but does not attack Ag (234)]

Esterification of C̄

This book includes the following esters of C under their own individual numbers, q.v.: *methyl trichloroacetate* (3:5800), *ethyl trichloroacetate* (3:5950), *n-propyl trichloroacetate* (3:6135), *isopropyl trichloroacetate* (3:5975), *n-butyl trichloroacetate* (3:6315), *isobutyl trichloroacetate* (3:6140), *sec-butyl trichloroacetate* (3:9372), *ter-butyl trichloroacetate* (3:0138), *n-amyl trichloroacetate* (3:6560), *isoamyl trichloroacetate* (3:6490), *ter-amyl trichloroacetate* (3:6185), *trichloromethyl trichloroacetate* (3:0290), *β-chloroethyl trichloroacetate* (3:6510), and *β-methoxyethyl trichloroacetate* (3:9250).

[For studies on esterification of C̄ under various conditions with MeOH (1:6120) (235) (236), with EtOH (1:6130) (235) (237) (238) (239) (240) (241) (242) (243) (244) (20), with *n*-propyl alc. (1:6150) (245), with isopropyl alc. (1:6135) (245) (246) (238), with *n*-butyl alc. (1:6180) (247) (248), with isobutyl alc. (1:6165) (247) (248) (83), with *sec.*-butyl alc. (1:6155) (247), with *ter*-butyl alc. (1:6140) (238), with *n*-amyl alc. (1:6205) (248), with pentanol-2 (1:6185) (248), with pentanol-3 (1:6175) (248), with *ter*-amyl alc. (1:6160) (248), with neopentyl alc. (1:5812) (249), with methyl-vinyl-carbinol (250), with benzyl alc. (1:6480) (238) (251), with diphenylcarbinol (1:5960) (238), with triphenylcarbinol (1:5985) (238), see indic. refs.]

[For study of equilibrium of transesterification with MeOAc (1:3005) or with EtOAc (1:3015) at 30° see (21).]

Addition Reactions of C̄ with Organic Compounds

Addition to unsaturated linkages. C̄ in pres. of suitable catalysts adds to unsatd. linkages giving the corresp. esters [e g., C̄ with propylene + BF_3 gives (48 8% yield (246)) isopropyl trichloroacetate (3:5975); C̄ with trimethylethylene (2-methylbutene-2) (1:8220) gives both *ter*-amyl trichloroacetate (3:6185) and methyl-isopropyl-carbinyl trichloroacetate (for extensive studies of this reaction see (252) (253) (254) (255) (256) (257) (258) (259) (260))].

[C̄ with acetylene + $HgSO_4$ at 60–80° gives (261) vinyl trichloroacetate [Beil. II_1-(94)], b.p. 149° at 760 mm.]

Addition to epoxy compounds. [C̄ with ethylene oxide (1:6105) in cold gives (28% yield (262)) (263) (264) ethylene glycol (mono)trichloroacetate (*β*-hydroxyethyl trichloroacetate) (3:9099). — For behavior of C̄ with 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358) see (264).]

Conversion of $\bar{C}$ to Corresponding Acid Halides

[The corresponding trichloroacetyl fluoride is unreported.]

[$\bar{C}$ with PCl_5 (266) (268) (269), with PCl_3 + $ZnCl_2$ (25% yield (270)), with $SOCl_2$ (yield 12% (270), 30% (271)) in C_6H_6 (60% yield (272)) or in pyridine (90% yield (273)), with P_2O_5 + HCl gas (274), with benzotrichloride (3:6540) + $ZnCl_2$ at 100° (77% yield (275)), or with benzoyl chloride (3:6240) (51–56% yield (276)) gives trichloroacetyl chloride (3:5420). — Note also that $\bar{C}$ on pyrolysis at 300° decomposes (100) with formn. of CO_2 + CO_2 + trichloroacetyl chloride (3:5420) + HCl.]

[$\bar{C}$ with PBr_3 gives (265) (266) trichloroacetyl bromide, b.p. 143° (266), 139.5–140° (265); this product is also obtd. from trichloroacetyl chloride (3:5420) with HBr gas at −5° (70% yield (267)).]

[$\bar{C}$ with PI_3 (266) (or better trichloroacetyl chloride (3:5420) with HI at −5° (277)) gives (71.5% yield (277)) trichloroacetyl iodide, b p 74.0–74.2° at 30 mm. (277).]

Conversion of $\bar{C}$ to Corresponding Anhydride

[$\bar{C}$ with P_2O_5 at 200–215° (278) (279), or Na$\bar{A}$ with SO_2Cl_2 (or SO_2 + Cl_2) in EtOAc (280), or $\bar{C}$ with trichloroacetyl chloride (3:5420) and PCl_3 (281), P_2O_5 (282), or $AlCl_3$ (283) gives (yields: 90–95% (280), 80% (278)) trichloroacetic acid anhydride (3:6575).]

Ⓟ **Color test with NH_4OH/Cu_2Cl_2 reagent.** $\bar{C}$ on shaking in filled stoppered bottle with conc. aq. NH_4OH contg Cu_2Cl_2 gives dark blue color instantly (284); note, however, that very similar behavior is shown by dichloroacetic acid (3:6208).

—— **Methyl trichloroacetate:** oil, b.p. 153° (see 3.5800).

—— **Ethyl trichloroacetate:** oil, b p. 167° (see 3:5950).

—— **Phenyl trichloroacetate:** oil, b p. 254–255° dec. (135). [From trichloroacetyl chloride (3:5420) with sodium phenolate in pet. ether (135).] [Note that the isomeric 4-(trichloroacetyl)phenol, m.p. 99 0–99.5° has been prepd. indirectly from trichloroacetonitrile + phenol + $AlCl_3$ (285).]

—— **o-Tolyl trichloroacetate:** unreported [Note, however, that the isomeric 4-(trichloroacetyl)-2-methylphenol, m.p. 90–91°, has been obtd. indirectly (285).]

—— ***m*-Tolyl trichloroacetate:** unreported. [Note, however, that both the isomers, viz., 4-(trichloroacetyl)-3-methylphenol, m.p. 83–87°, and 6-(trichloroacetyl)-3-methylphenol, oil, have been obtd. indirectly (285).]

—— ***p*-Tolyl trichloroacetate:** m.p. 68–69° (285). [Obtd only by indirect means (285).]

—— **Benzyl trichloroacetate:** oil, b p 178 5° at 50 mm (286), 148–149° at 15 mm. (264), D_4^4 = 1.3887 (286), $n_D^{18.8}$ = 1.5288 (286). [From $\bar{C}$ with benzyl alc. (1:6480) + HCl gas at 100° (286), or from trichloroacetyl chloride (3:5420) with benzyl alc (1:6480).]

—— ***p*-Nitrobenzyl trichloroacetate:** m p. about 80° cf. (287). [Unsuitable as Ⓓ (287).]

—— **Phenacyl trichloroacetate:** unreported.

—— ***p*-Chlorophenacyl trichloroacetate:** unreported.

—— ***p*-Bromophenacyl trichloroacetate:** unreported.

—— ***p*-Iodophenacyl trichloroacetate:** unreported.

—— ***p*-Phenylphenacyl trichloroacetate:** unreported.

Ⓓ ***S*-Benzylthiuronium trichloroacetate:** m p 148–149° (288). [Note that for corresp. salts from chloroacetic acid (3:1370) and from dichloroacetic acid (3:6208) m.p. values are respectively 159–160° and 178–179° (288).]

Ⓓ ***S*-(*p*-Chlorobenzyl)thiuronium trichloroacetate:** m.p. 148° cor. (289). [From $\bar{C}$ (as Na$\bar{A}$) with *S*-(*p*-chlorobenzyl)thiuronium chloride (289) (m.p. 197°) in alc. (289); note that corresp deriv. of chloroacetic acid (3:1370) has m.p. 158° cor. (289).]

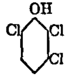
3:1160 2,3,6-TRICHLOROPHENOL



$C_6H_3OCl_3$ Beil. VI - 190
VI_1—
VI_2-(180)

M.P. 58° (1) (2)
55° (4)
53–54° (5) (6)

B.P. 252–253° u.c. (5)
248.5–249.5° (6)

Ndls. (from alc.) with intense and persistent phenolic odor. — Somewhat sol. in hot aq.; volatile with steam. — Eas. sol. alc., ether, lgr., AcOH; sol. hot C_6H_6 but ppts. on cooling.

[For prepn. from 2,3,6-trichloro-4-aminophenol via diazo reactn. see (3).]

$\bar{C}$ is strongly acidic; ionization const. at 25° is 7.3×10^{-7} (2); $\bar{C}$ dissolves in Na_2CO_3 or NaOH (5); $\bar{C}$ can be titrated with $N/10$ alk.; Neut. Eq. = 197.5 (1) (4).

$\bar{C}$ in AcOH, treated with 1.4 moles Br_2, poured into aq. yields 4-bromo-2,3,6-trichlorophenol, ndls. from AcOH, m.p. 80° (3). [The methyl ether of this prod. has m.p. 69–70°; the benzoate, m.p. 110° (3).]

$\bar{C}$ treated with 1.5 moles Br_2 without solvent yields (3) 4,5-dibromo-2,3,6-trichlorophenol, ndls. from dil. AcOH, m.p. 205° (3). [The methyl ether of this prod. has m p. 130°; the benzoate, m.p. 153° (3).]

$\bar{C}$ treated with $(CH_3)_2SO_4$ + 20% KOH at 100° for an hour yields its own methyl ether, 2,3,6-trichloroanisole, b.p. 227–229° at 756 mm.; pr. from alc., m.p. 45° (3).

Ⓓ **2,3,6-Trichlorophenyl benzoate**: from $\bar{C}$ + BzCl + 10% KOH; cryst. from pet. ether/lgr., m.p. 92–93° (3); from alc., m.p. 90° (4).

3:1175 2,3-DICHLOROPHENOL

$C_6H_4OCl_2$ Beil. VI —
VI_1-(102)
VI_2—

M.P. 58° (1)
56–57° (2) (3)

B.P. 206° (1)

Cryst. (from pet. eth. (3)). — $\bar{C}$ mixed with 2,5-dichlorophenol (3:1190), m p. 57°, depresses m.p. (2). — $\bar{C}$ is extraordinarily volatile; if dried in vac. this leads to substantial

losses; the volatility and intense odor of C̄ differentiate this dichlorophenol from its isomerides (2). — Odor resembles that of o-chlorophenol and iodoform (3). — C̄ is volatile with steam (3).

[For prepn. from 3-amino-2-chlorophenol via Sandmeyer method see (2) (4); from 2,3-dichloroaniline via diazo reaction see (3); from barium 2,3-dichlorophenol-4,6-disulfonate by hydrolysis of sulfonic acid groups with steam (70% yield) see (1).]

[For data on dissociation constant see (5).]

C̄ on direct bromination (1) yields 4,6-dibromo-2,3-dichlorophenol, colorless ndls. (rapidly becoming opaque) from AcOH (1), or colorless feathery ndls. from alc. (4), m p. 90° (1) (4). [The methyl ether of this product, 4,6-dibromo-2,3-dichloroanisole, long needle-like pr. from alc., has m.p. 82° (1).]

C̄ dislvd. in aq. NaOH and shaken with $(CH_3)_2SO_4$ yields (3) the methyl ether, 2,3-dichloroanisole, m.p. 31° (3).

3:1175 (1) Hodgson, Kershaw, *J. Chem. Soc.* **1930**, 1423. (2) Henley, Turner, *J. Chem. Soc.* **1930**, 940 (3) Holleman, *Rec trav. chim.* **37**, 101–104 (1918). (4) Hodgson, Smith, *J. Chem. Soc.* **1931**, 2271. (5) Murray, Gordon, *J. Am. Chem. Soc.* **57**, 110–111 (1935).

3:1190 2,5-DICHLOROPHENOL

$C_6H_4OCl_2$ Beil. VI - 189, VI_1-(103), VI_2-(178)

M.P. 58° (1) (2) (3) (4); 59° (5) B.P. 211° at 744 mm. (1) (4); 94° at 14 mm. (3)

Cryst with strong and persistent phenolic odor. — Spar. sol. aq., eas. sol. alc., ether, C_6H_6 — Volatile with steam.

[For prepn. from 2,5-dichloroaniline [Beil. XII-625] via diazo reaction (90% yield (1); 86% yield (6); 70% yield (5)) see (1) (6) (5) (2); from 1,2,4-trichlorobenzene + $NaOCH_3$ in MeOH at 180° see (7)]

C̄ in dil. alc. reddens blue litmus, dec. on boilg. with Na_2CO_3 Gives only faint color with $FeCl_3$ (1). [For study of ionization const. see (11)]

C̄ dislvd. in 3 pts. $CHCl_3$ and shaken with conc. HNO_3 gives on cooling $CHCl_3$ 80% yield of 2,5-dichloro-4-nitrophenol [Beil. VI-241], colorless ndls. from pet ether, m p. 117° (8). [Further nitration yields 2,5-dichloro-4,6-dinitrophenol, yel. pr.. m p. 146° (8).] — C̄ htd. with conc. H_2SO_4 + fumg. H_2SO_4, then nitrated as specified (9), yields 2,5-dichloro-6-nitrophenol, volatile with steam, yel. pr. from pet. eth., m p. 70° (9).

C̄ in AcOH treated with 2 moles Br_2, poured into aq., gives (100% yield (6)) 2,5-dichloro-4,6-dibromophenol, ndls. from dil. AcOH, m.p. 100.5° (6), 99–100° (10). [This dibromo compd. results also from C̄ in AcOH + NaOAc + *1* mole Br_2 on htg. at 100° (10).] [C̄ with Fe + excess Br_2 gives (100% yield (6)) 2,5-dichloro-3,4,5-tribromophenol, ndls. from AcOH, m p. 206° (6).]

C̄ dislvd. in KOH and shaken with $(CH_3)_2SO_4$ yields the methyl ether, 2,5-dichloroanisole, b p 225–227° u c. at 752 mm. (6), b p. 140° at 40 mm. (2), m p. 24° (5) (2).

Ⓓ 2,5-Dichlorophenyl benzoate: from C̄ + aq. KOH + BzCl, ndls. from 96% alc., m p. 69° (6).

Colorless tbls. from dil. alc. or lgr. — Vapors of C̄ are very strongly lachrymatory (see also below). — C̄ is insol. aq. but volatile with steam; C̄ is eas sol alc., ether, or C_6H_6.

[For study of soly. of C̄ in EtOH, C_6H_6, CCl_4, or acetophenone over range −23.5° to 53 5° see (19): note that C̄ with C_6H_6 (1:7400) gives (19) a eutectic, m.p −1.6°, contg. 76 wt. % C̄; C̄ with acetophenone (1:5515) gives a eutectio, m p. +5.9°, contg 70 wt. % C̄ (19).]

USES OF C̄

In addn. to its uses as a chem. intermediate, C̄ because of its irritant and lachrymatory properties has been much studied as a chemical warfare agent and tear gas under the arbitrary designation "CN."

[For general surveys from this viewpoint see (20) (21). — C̄ is sol. in many org solvents and is frequently loaded into grenades and shells in such solutions of which three common examples are "CNB" (consisting of C̄ + C_6H_6 + CCl_4), "CND" (consisting of C̄ + ethylene dichloride (3:5130)), and "CNS" (consisting of C̄ + $CHCl_3$ + nitrochloroform = chloropicrin). — For examples of patents on these and other types of tear-gas cartridges and munitions contg. C̄ see (23) (24) (25) (26) (27); for use of C̄ as insecticide see (28).]

[For dispensing apparatus for C̄ (29) or for mill for disintegration of C̄ (30) see indic. refs.]

[For m.p./compn. diagram of system $\bar{C}$ + "Adamsite" (10-chloro-9,10-dihydrophenarsazine), eutectic, m.p. 50°, contg. 90 mole % $\bar{C}$, see (31).]

[For studies of effect of $\bar{C}$ on skin see (32) (33) (34); for contamination of food by $\bar{C}$ see (35).]

PREPARATION OF $\bar{C}$

From chloroacetyl chloride with benzene. [For prepn. of $\bar{C}$ from chloroacetyl chloride (3:5235) with C_6H_6 + $AlCl_3$ (yield 85–88% (15) (64)) (2) (14) (36) (71) see indic. refs.]

From acetophenone. [For prepn. of $\bar{C}$ from acetophenone (1:5515) with Cl_2 in AcOH (4) (18), in CS_2 (85% yield (37)), in lgr. (38) or directly without solvent (yields 65% (6) (37)) (39) see indic. refs.; from acetophenone (1:5515) by electrolysis of its soln. in HCl (40), or by *chlorination* with aq. *N*-chlorourea (41), see indic. refs.]

From benzoyl chloride with diazomethane. [For formn. of $\bar{C}$ from benzoyl chloride (3:6240) with diazomethane in ether (72% yield) see (3); note, however, that this procedure has subsequently been much disputed, and for discussion see also (42) (43) (44) (45) (46) (47) (48).]

From miscellaneous sources. [For prepn. of $\bar{C}$ from *N*-(α,β-dichlorovinyl)diethylamine (yield 92.6% (49)), from chloroacetonitrile (50), or for possible formn. from chloroacetic acid (3:1370) (51), all with C_6H_5MgBr, see indic. refs.; for formn. of $\bar{C}$ from phenyl copper (52), from phenyldichloroarsine (yields: 58.5% (53), 55% (54)) (55), all with chloroacetyl chloride (3:5235), see indic. refs.; for formn. of $\bar{C}$ from 1-chloro-2-phenylpropanol-2 (styrene chlorohydrin) (3:9570) by oxidn. with $K_2Cr_2O_7/H_2SO_4$ (1) or from diphenacyltelluride dichloride by oxidn. with $KMnO_4$ (5) see indic. refs.; for formn. of $\bar{C}$ from benzalacetophenone (chalcone) (1:5155) by actn. of Cl_2 in *ter*-butyl alc. (other prods. are also formed) see (17).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Reduction

No authentic studies on reduction of $\bar{C}$ appear to be reported.

Oxidation

$\bar{C}$ on oxidn. with CrO_3 (39), or $K_2Cr_2O_7$ + H_2SO_4 (58) (13) gives benzoic acid (1:0715). — $\bar{C}$ also reduces $NH_4OH/AgNO_3$ (13) [perhaps because of some hydrolysis to ω-hydroxyacetophenone (1:5180)].

Halogenation

Chlorination. [$\bar{C}$ on further chlorination under conditions favoring side-chain substitution would be expected to yield ω,ω-dichloroacetophenone (3:6835) and ultimately ω,ω,ω-trichloroacetophenone (3:6874), but no authentic record that this has actually been achieved can be found.]

Bromination. [$\bar{C}$ with Br_2 under suitable conditions gives (56) ω-bromo-ω-chloroacetophenone, m.p. 37–37.5°, b.p. 133–134° at 7.5 mm. (56). — $\bar{C}$ in AcOH + NaOAc with Br_2 as directed (57) gives a mixt. consisting of 30% ω,ω-dibromo-ω-chloroacetophenone + 70% ω,ω,ω-tribromoacetophenone.]

Nitration. $\bar{C}$ in conc. H_2SO_4 at −20° treated as directed (9) with a mixt. of fumg. HNO_3 (D = 1.50) + conc. H_2SO_4 gives (77% yield (9)) *m*-nitrophenacyl chloride, m.p. 103° (59), 102–103° (16), 100.5–102° (9). — [Note that the other two isomeric mononitrophenacyl chlorides, viz., *o*-nitrophenacyl chloride, m.p. 66–67° (60) (61), and *p*-nitrophenacyl chloride, m.p. 107° (62), are also known, but prepd. indirectly; note also that no dinitration prods. of $\bar{C}$ are known.]

Behavior of $\bar{C}$ with Other Inorganic Reactants

With water. [$\bar{C}$ does *not* readily hydrolyze with aq. but on protracted boilg. (e g , 20 hrs. (63)) with a large vol. of aq. gives ω-hydroxyacetophenone (1:5180).]

With nitrous acid. $\bar{C}$ with HNO_2 (from *n*-butyl nitrite + HCl gas) in dry ether gives (yields: 85 6% (64), 82–86% (15)) ω-chloro-ω-isonitrosoacetophenone (phenylglyoxylohydroxamyl chloride) [Beil. X-662, X_1-(315)], white ndls. from CCl_4 (64) or from CCl_4 + C_6H_6 (3:1) (15), m.p. 132–133° (15) (64).

With PCl_5. [$\bar{C}$ with PCl_5 on distn. gives (65) α,β-dichlorovinylbenzene (α,β-dichlorostyrene) [Beil. V-477, V_2-(367)], b.p. 221°.]

With various salts of inorganic acids. [$\bar{C}$ with KI (66) (67) or better NaI (38) in alc. gives *ω-iodoacetophenone* (phenacyl iodide) [Beil. VII-286], m p. 30°; for study of rate of reactn. of $\bar{C}$ with KI in acetone at 0° (11) or with NaI or LiI in acetone at 0° or −10° (10) see indic. refs.]

$\bar{C}$ does *not* add $NaHSO_3$ (37). — $\bar{C}$ in alc. with $Na_2S_2O_3$ (2 moles) in aq. refluxed 20 hrs. gives sodium phenacylthiosulfate which with HCl gives (73% yield (69)) ω-mercaptoacetophenone (phenacyl mercaptan). — $\bar{C}$ with Na_2S in alc. at 60° gives (70) diphenacyl sulfide [Beil. VIII-94, $VIII_1$-(541)], m.p. 76 5–77.2° (70), 76° (147); for use of this reactn. in detn. of $\bar{C}$ see (14).

With ammonia. [$\bar{C}$ with NH_3 (1 mole) would be expected to give ω-aminoacetophenone (phenacylamine) [Beil. XIV-49, XIV_1-(368)], but such direct result has never been reported; note, however, that $\bar{C}$ (1 mole) with hexamethylenetetramine (1 mole) in $CHCl_3$ at room temp. for 12 hrs. gives (60% yield (68)) a 1:1 addn cpd., m p. 145°, which upon alcoholysis with conc. HCl in alc. 3 days in cold gives (63–74% yield (68)) phenacylamine hydrochloride.

[$\bar{C}$ with alc. NH_3 in s.t. at 100° as directed (2) gives a mixt. contg diphenacylamine hydrochloride [Beil. XIV-53, XIV_1-(371)], m.p. 235°, together with the hydrochlorides of 2,5-diphenylpyrazine and 2,6-diphenylpyrazine; for discussion of mechanism see (2).]

Behavior of $\bar{C}$ with Organic Reactants

With Hydrocarbons (+ $AlCl_3$)

$\bar{C}$ with C_6H_6 + $AlCl_3$ *in s.t. at 100° failed to react (71).* — $\bar{C}$ *with toluene (1:7405)* + $AlCl_3$ under reflux gives (71) a prod , m.p 84–85°, which is presumably ω-(*p*-tolyl)acetophenone [Beil. VII-448], although this prod. obtd. by other methods has different consts.

With Organic Hydroxy (or Mercapto) Compounds

With alcohols. [$\bar{C}$ with NaOMe might be expected to yield ω-methoxyacetophenone, b p 228–230° at 760 mm. (72) (73), b p. 118–120° at 15 mm. (72) (73), m.p. 7–7 5° (73) (corresp. semicarbazone, m.p. 85° (72), 129° (73) (note disagreement); corresp. 2,4-dinitrophenylhydrazone, m p. 191–192° (73)); note, however, that no record of this reaction has been reported and the ω-methoxyacetophenone is best prepd. (71–78% yield (74)) from methoxyacetonitrile with C_6H_5MgBr; *note also that* $\bar{C}$ *with alk. reagts. such as NaOMe reacts in an unexpectedly complex manner yielding (153) cyclic " halogen-diphenacyls."*]

[$\bar{C}$ with NaOEt would be expected to yield ω-ethoxyacetophenone [Beil VIII-90], b p. 134–136° at 21 mm. (75), 130° at 15 mm. (76), 120–122° at 15 mm. (77), D_4^{20} = 1.0552 (77), n_D^{20} = 1 5250 (77) (corresp. oxime, m.p. 55° (75); corresp. semicarbazone, m.p. 128° (75)); note, however, that no record of this reactn. has been reported and the ω-ethoxyacetophenone is best prepd. (68% yield (77)) cf. (75) (76) from ethoxyacetonitrile with

C_6H_5MgBr; note also that C̄ with alk. reagts. such as NaOEt reacts in an *unexpectedly* complex manner yielding (153) cyclic "halogen diphenacyls."

[C̄ (1 mole) with ethylene glycol (1:6465) (1 mole) in C_6H_6 contg. trace of benzenesulfonic acid gives on htg. (95% yield (81)) the corresp. cyclic ketal, viz., 2-(chloromethyl)-2-phenyl-1,3-dioxolane, m.p. 67°, b.p. 144–146° at 15 mm. (81).]

With phenols. [C̄ with dry sodium phenolate (78) gives ω-phenoxyacetophenone [Beil. VIII-91], m.p. 74° cor. (79), b.p. 255–257° (78), 187° cor. at 9 mm. (79) (corresp. semicarbazone, m.p. 187.0–187.5° cor. (79)); note, however, that this prod. is best prepd. (45% yield (79)) from phenoxyacetonitrile with C_6H_5MgBr, or from phenoxyacetyl chloride + C_6H_6 + $AlCl_3$ cf. (80).]

With mercaptans. [C̄ with *n*-BuSH in alc. NaOH gives (82) phenacyl *n*-butyl sulfide, b.p. 140° at 3 mm., D_{25}^{25} = 1.0589, n_D^{20} = 1.5050.]

[C̄ with sodium *p*-nitrothiophenate in aq. alc. on htg. gives (98% yield (83)) phenacyl *p*-nitrophenyl sulfide, yel. pl. from 50–80% AcOH, m.p. 118°. — C̄ (1 mole) with sodium *p*-thiocresolate (1 mole) in MeOH boiled several hrs. does *not* give the expected phenacyl *p*-tolyl sulfide, m.p. 37° cf. (101); distillation of the reaction prod. gives (58.5% yield (84)) phenacyl *p*-tolyl sulfoxide, b.p. 182–184° at 5 mm., m.p. 46° accompanied by acetophenone; note that with H_2O_2 this sulfoxide oxidizes to phenacyl *p*-tolyl sulfone, m.p. 110° (see also below).]

Behavior with Carbonyl Compounds

With aromatic aldehydes. [C̄ (1 mole) with benzaldehyde (1½ moles) in alc. with alc. NaOEt (1 mole) in cold condenses with loss of HCl giving (80% yield (85)) α-benzoyl-α′-phenyl-ethylene oxide (benzalacetophenone oxide) [Beil. XVII₁-(196)], colorless cryst. from alc. (85) or from cold acetone by addn. of pet. ether (86), m.p. 89–90° (85) (86); note that this prod. can also be obtd. in other ways, notably from benzalacetophenone (chalcone) (1:5155) with Na_2O_2 + HCl in cold (85% yield (86)) or with H_2O_2 in alk. soln. (90% yield (88)) (87) (89); although *cis* and *trans* stereoisomers are possible, only one form is known.]

[C̄ with *o*-nitrobenzaldehyde in alc. NaOEt (although this particular pair has not actually been reported) should yield similarly α-benzoyl-α′-(*o*-nitrophenyl)ethylene oxide [Beil. $XVII_1$-(197)] since phenacyl bromide behaves (90) in this fashion; note that for this prod. the two expected geom. stereoisomers are both formed, one with m.p. 175°, the other with m.p. 110°.]

[C̄ with *m*-nitrobenzaldehyde in alc. NaOEt (although this particular pair has not actually been reported) should give similarly *α-benzoyl-α′-(m-nitrophenyl)ethylene oxide* [Beil. $XVII_1$-(197)] since phenacyl bromide behaves in this manner (80% yield (91)); one stereoisomer is known, m.p. 118° (91). — Note, however, that C̄ (1 mole) with *m*-nitrobenzaldehyde (1 mole) in AcOH satd. with HCl gas and stood 24 hrs. reacts differently giving (92) *m*-nitrobenzalacetophenone dichloride [Beil. VII_1-(238)], m.p. 148°.]

[C̄ (1 mole) with *p*-methoxybenzaldehyde (anisaldehyde) (1:0240) (1 mole) in alc. NaOEt gives (93) α-benzoyl-α′-(*p*-methoxyphenyl)ethylene oxide, m.p. 87° (93) (89); also obtd. from *p*-methoxybenzalacetophenone (1:9011) with alk. H_2O_2 (89).]

[C̄ (1 mole) + *o*-nitrobenzalacetophenone (1 mole) in acetone/dioxane with alc. NaOEt (1 mole) gives in 15 min. but yield not stated (93) 1,2-dibenzoyl-3-(*o*-nitrophenyl)cyclopropane, m.p. 177° (93).]

Behavior of C̄ with Salts of Organic Acids

C̄ with salts of organic acids gives in general the corresp. phenacyl esters although when the latter are to be prepd. as means of identification of the acids the more reactive phenacyl

bromide is usually employed; for m.p.'s of the phenacyl esters of various acids of Order I see Vol. I, p. 650.

[$\bar{C}$ with KCN in dil. alc. on htg. gives (47% yield (94)) ω-cyanoacetophenone (benzoylacetonitrile) [Beil. X-680, X_1-(322)], m.p. 83° (94), 80–81° (95) (96); this prod. may also be prepd. by other means, e.g., from phenacyl bromide with dil. alc. KCN (60% yield (97)), or from ethyl benzoate with acetonitrile + NaOEt (yields: 60% (96), 56% (95)).]

[$\bar{C}$ with KSCN in MeOH (98) or EtOH (65) gives ω-thiocyanoacetophenone (phenacyl thiocyanate) [Beil. VIII-94], m.p. 74.1–76.6° cor. (98), 74° (99).]

[$\bar{C}$ with sodium p-toluenesulfinate in boilg. alc. gives (100) cf. (101) phenacyl p-tolyl sulfone (ω-(p-toluenesulfonyl)acetophenone), m.p. 110° (100) (see also above for formn. of this prod. from $\bar{C}$ + sodium thio-p-cresolate).]

Behavior of $\bar{C}$ with RMgX Compounds

[$\bar{C}$ (1 mole) with EtMgBr (1 mole) in dry ether gives an addn. prod. which after evapn. of ether, htg. at 130–140°, and hydrolysis gives (yield not stated (102)) benzyl ethyl ketone (1-phenylbutanone-2) [Beil. VII-314, VII_1-(167)], b.p. 222–227° (103), 221–223° (102), 110° at 13 mm. (104) (corresp. semicarbazone, m.p. 156–156.5° cor. (105), 150–153° (103), 153° (106), β-form 152°, α-form 146° (104), 146° (102), corresp. 2,4-dinitrophenylhydrazone, m.p. 140–141° (103)); not rearr. in formn. of this prod. by this method.]

[$\bar{C}$ with n-hexyn-1-yl MgBr in dry ether adds normally and on hydrolysis gives (107) the expected 1-chloro-2-phenylnonyn-3-ol-2.]

Behavior of $\bar{C}$ with Amines

With primary aliphatic amines. [$\bar{C}$ (1 mole) with $MeNH_2$ (2.5 moles) in alc. for 5–6 hrs. in cold gives (108) ω-(methylamino)acetophenone [Beil. XIV-50, XIV_1-(369)] (corresp. $\bar{B}$.HCl (23% yield (108)), m.p. 219° (108)). — $\bar{C}$ with $n\text{-}BuNH_2$ similarly gives (35% yield (108)) ω-(n-butylamino)acetophenone hydrochloride, m.p. 214–215° (108).]

[$\bar{C}$ with β-aminoethanol (ethanolamine) readily gives (109) N-(β-hydroxyethyl)phenacylamine, m.p. 144° (109).]

With primary aromatic amines. [$\bar{C}$ with aniline should yield N-(phenacyl)aniline [Beil. XIV-51, XIV_1-(369)], m.p. 98–99° (110) (corresp. oxime, m.p. 105–106° (111); corresp. semicarbazone, m.p. 171° (110)); however, although the rate of this reaction in abs. alc. at 40° (38) and in 90% alc. at 30.5° (16) cf. (112) has been studied, the usual method of prepn. of N-(phenacyl)aniline is from phenacyl bromide + aniline. — *Pure* N-(phenacyl)aniline, contrary to earlier statements, is remarkably stable and can be exposed to air at room temp. for 18 months or distilled under reduced press. (b.p. 208–210° at 12 mm.) without change (113); for important study of mechanism of conversion of N-(phenacyl)aniline to 2-phenylindole see (113) (114).]

[The behavior of $\bar{C}$ with the three toluidines has not itself been studied but should be similar to that of phenacyl *bromide* which with o-toluidine gives (115) (116) N-(phenacyl)-o-toluidine [Beil. XIV-52, XIV_1-(370)], m.p. 91° (116), 89° (115) (corresp. oxime, m.p. 92° (116)); with m-toluidine gives N-(phenacyl)-m-toluidine, m.p. 110° (117); with p-toluidine gives N-(phenacyl)-p-toluidine [Beil. XIV-52, XIV_1-(370)], m.p. 134° (118), 127° (115) (corresp. oxime in two geom. stereoisomers of m.p. 97° and 92°, resp. (111)).]

With secondary aliphatic amines. [$\bar{C}$ with Me_2NH should yield ω-(dimethylamino)-acetophenone (phenacyl dimethylamine) [Beil. XIV-50], b.p. 126–128° at 18 mm. (119), 122–123° at 14 mm. (120) (corresp. $\bar{B}$.HCl, m.p. 174° (120), corresp. $\bar{B}$.HBr, m.p. 184–186° (121), corresp. $\bar{B}$.PkOH, m.p. 150° (119), 143° (122), 141° (123)); note, however,

that this particular combination of reactants has not actually been reported and that the ω-(dimethylamino)acetophenone is usually obtd. from phenacyl *bromide* with Me_2NH (119) (121), or from dimethylaminoacet-*N*,*N*-dimethylamide with C_6H_5MgBr (80% yield (120) (125)).]

[C̄ (1 mole) with Et_2NH (2 moles) in C_6H_6 stood 2 days at room temp. ppts. $Et_2NH.HCl$ and gives (65% yield (125)) ω-(diethylamino)acetophenone, b.p. 148–152° at 30 mm. (125), $n_D^{23} = 1.5180$ (125).]

[C̄ + *bis*-(β-hydroxyethyl)amine (diethanolamine) in C_6H_6 on long boilg. gives (109) *N*-phenacyl-*N*,*N*-*bis*-(β-hydroxyethyl)amine, m.p. 44° (109).]

With secondary heterocyclic amines. [C̄ with piperidine in dry ether splits out HCl and yields (126) ω-(piperidino)acetophenone (*N*-(phenacyl)piperidine) [Beil. XX-42], b.p. 180–181° cor. at 26 mm. (127), 157° at 15 mm. (128), 163–164° at 13 mm. (126), $D_4^{21.2} =$ 1.0430 (126), $n_D^{22.4} = 1.5408$ (126) (corresp. B̄.HCl, m.p 226–227° (129), corresp. B̄.HBr, m.p. 227–228° (135), corresp. oxime, m.p. 112–115° (130)).]

[C̄ with morpholine in dry ether ppts. morpholine HCl and yields (131) ω-(morpholino)-acetophenone (*N*-(phenacyl)morpholine), m.p. 50–52° (132) (corresp. B̄.HCl, m.p. 222–223° cor. (133), 219–223° (134), 213–214° dec. (131), 212–214° (132); corresp. B̄.PkOH, m.p. 156–157° (132)).]

[C̄ (1 mole) with *N′*-phenylpiperazine (2 moles) in dry ether at room temp. for several hrs. (136) or C̄ (1 mole) with *N′*-phenylpiperazine (1 mole) + slight excess anhydr. Na_2CO_3 in alc. refluxed ½ hr. (136) gives 80–85% yield *N*-phenacyl-*N′*-phenylpiperazine, m.p. 106–108° cor. (136) (corresp. B̄.HCl, m.p. 210–212° cor.; corresp. oxime, m.p. 157–158° cor. (136)).]

[Note, however, that C̄ with 3-carbethoxy-2-methylpyrrole + $AlCl_3$ in CS_2 does not acylate the nitrogen but gives Friedel-Crafts type reaction yielding (137) 3-carbethoxy-2-methyl-5-phenacylpyrrole, m.p. 205°.]

With tertiary aliphatic amines. [Direct addn. of C̄ to Me_3N appears not to have been reported; the quaternary salt to be expected, viz., phenacyl-trimethyl-ammonium chloride, m.p. 204° dec. (138), 202° (121), has been prepd. indirectly.]

With tertiary aromatic amines. [The quaternary salt, viz., dimethyl-phenyl-phenacyl-ammonium chloride, to be expected from C̄ + dimethylaniline is unreported.]

With tertiary heterocyclic amines. (See also below under Ⓓ's.)

[C̄ (1 mole) with pyridine (1+ moles) in dry C_6H_6 on warming gives (25% yield (139)) phenacyl-pyridinium chloride, m.p. 109–110° (139), 113° (140); note that this prod. with aq. 20% NaOH at room temp. [illegible] benzoic acid (1:0715) and (30% yield (141) [illegible] b.p. 127° at 12 mm. (141). — For st[illegible]5.6° (142) or in 90% alc. at 30.5° (16) cf. (112) see indic. refs.]

Behavior of C̄ with Arylhydrazines

(See also below under Ⓓ's.) — C̄ with many arylhydrazines does *not* yield the corresp. arylhydrazones because the reaction takes a different course.

C̄ (2 g.) with phenylhydrazine (1.4 g.) in warm EtOH (20 ml.) contg. $NaOAc.3H_2O$ in aq. (10 ml.) ppts. (14) a yellow solid, m.p. 137° dec. (14), regarded as 1,3-diphenyl-(1,2-diazacyclobutene-2). — Similarly, C̄ with *o*-tolylhydrazine gives (14) 1-(*o*-tolyl)-3-phenyl-(1,2-diazacyclobutene-2), m.p. 147.2° (14); C̄ with *p*-tolylhydrazine gives (14) 1-(*p*-tolyl)-3-phenyl-(1,2-diazacyclobutene-2), m.p. 159.8° dec. (14); C̄ with *p*-nitrophenylhydrazine gives (14) 1-(*p*-nitrophenyl)-3-phenyl-(1,2-diazacyclobutene-2), m.p. 173° dec. (14). — [For further discussion of structures of these prods. see also (143).]

Behavior of $\bar{C}$ with Other Miscellaneous Nitrogeneous Reactants

$\bar{C}$ with diazomethane in dry ether + MeOH for 12 hrs. gives (88% yield (144)) 3-chloro-2-phenyl-1.2-epoxypropane (α-chloromethyl-α-phenyl-ethylene oxide), b.p. 135–137° at 17 mm. (144).]

Ⓓ **Chloromethyl phenyl ketoxime:** cryst. from CS_2, m.p. 88 5–89° (4), 88–89° (17). [From $\bar{C}$ (1 mole) + hydroxylamine hydrochloride (3 moles) in dil. MeOH stood overnight, prod. pptd. by addn. of aq. (4); note that this oxime on Beckmann rearr. with PCl_5 gives (4) ω-chloroacetanilide, m.p 134.5° (5)]

Ⓓ **Chloromethyl phenyl ketone 2,4-dinitrophenylhydrazone:** orange cryst., m.p. 212° cor. (145). [See above for behavior of $\bar{C}$ with various other arylhydrazines.]

Ⓓ **Chloromethyl phenyl ketone semicarbazone:** m p. 160° on "Maquenne bloc" (1), 156° (146), 149° (147). [From $\bar{C}$ (3.1 g.) in alc. (25 ml) with semicarbazide hydrochloride (2.2 g.) in aq. (12.5 ml.) at 40° on addn of $NaHCO_3$ (1.7 g.) in small increments; yield 71% (147); for study of chem. behavior of this prod see (147).]

— *N*-(Phenacyl)phthalimide (ω-phthalimidoacetophenone) [Beil. XXI-479]: m.p. 167° u.c. (148), 166° (149). [This prod. has never been reported from C + K phthalimide but has been prepd. indirectly. However, for its prepn. from phenacyl *bromide* with K phthalimide see (150).]

— *N*-(Phenacyl)tetrachlorophthalimide (ω-(tetrachlorophthalimido)acetophenone): pl. from $CHCl_3$ on pouring into MeOH, m p. 258–259° (151). [From $\bar{C}$ (?) or phenacyl bromide with K tetrachlorophthalimide (151)]

Ⓓ **Condensation prod. from $\bar{C}$ with *N*-methyl-β-(carbohydrazido)pyridinium *p*-toluenesulfonate:** cryst. from EtOH/ether 1:1, m.p. 120° cor. (152). [From $\bar{C}$ + the quat. salt of nicotinic acid hydrazide with methyl *p*-toluenesulfonate (152).]

[See also anhydrous chloral (3:5210) and chloral ethylalcoholate (3:0860).]

The m.p. of C̄ is profoundly affected by mode of heating and by pressure (1) (2) but when taken in test tube in ord. m.p. apparatus is claimed to be consistently 59–60° (2). — [For especially extensive studies on the m.p. of C̄ see (1) (2) (6) (10).]

C̄ undergoes a transition point at 32° detectable by dilatometric methods (15). Furthermore, C̄ on heating dissociates into anhydrous chloral and H_2O; the temperature at which dissocn. begins is unknown, but dissocn. is complete at 78° (15).

Ordinary C̄ is definitely the monohydrate, but other hydrates of chloral (3:5210) have been claimed (6). However, the suggestion (16) that C̄ may exist in two modifications appears to be discredited (6) (10).

[For study of crystal structure of C̄ see (18); for density and refractive index of various solns. of C̄ in aq., EtOH, or toluene see (12); for study of toxicity of C̄ see (19).]

Note that C̄ on htg. does *not* give inflammable vapor (diff. from chloral ethylalcoholate (3:0860).

C̄ is eas. sol. in aq. or alc.; much less sol. in $CHCl_3$ or toluene. [E.g., 1 pt. aq. dissolves following parts C̄ at indic. temps.: at 0°, 2.4; at 5°, 2.9; at 10°, 3.8; at 15°, 4.9; at 20°, 6.6; at 25°, 8.3; at 30°, 10.1; at 35°, 12.1; at 40°, 14.3 pts. C̄ (20).] — Aq. solns. of C̄ are frequently designated as chloral sirup; for study of stability of such solns. see (21).

CHEMICAL BEHAVIOR OF C̄

Important note. The chemistry of chloral hydrate (C̄) on one hand and that of anhydrous chloral (3:5210) on the other is so closely interwoven that the division of material between them in this book is necessarily arbitrary. Most of the definite chemical reactions of chloral hydrate have been associated with the text of anhydrous chloral (3:5210), which should always be consulted. Certain methods for the detection and for determination of chloral and chloral hydrate, however, are brought together here under the latter.

Determination of C̄

For the quantitative detn. of C̄ several different principles have been employed as further explained below.

By behavior with alkali. This method is based upon the fact that C̄ with aq. alkali undergoes hydrolytic cleavage to $CHCl_3$ (3:5050) and formic acid (1:1005); since the

latter is neutralized 1 equivalent of alkali is used up for each mole of formic acid produced and therefore for each mole of C̄ originally present. Since on the one hand the $CHCl_3$ produced is readily volatile and since on the other it is itself attacked by the excess alkali, some standardization of conditions is required. The process usually involves use of a known amount (excess) of standard alkali followed by back titration with standard acid.

[For especially valuable summaries and discussion of this method see (22) (23); for additional material on characteristics of this method see (24) (25) (26) (27) (28) (29) (30) (31) (32) (33) (34) (35) (41); for discussion of detn. of the formate produced see (22).]

If the sample contains other substances which independently react with alkali and thus interfere with the above method, C̄ may be determined by reduction to acetaldehyde (1:0100) and characterization of the latter. E.g., C̄ with Zn + strong HCl (36) (37), or with Zn + dil. H_2SO_4 (37) (38) (27) cf. (42), gives acetaldehyde (1:0100); this may be detd. as *p*-nitrophenylhydrazone (36) (or otherwise) or if H_2SO_4 was used total chloride ion may be determined (42). This reduction to acetaldehyde is of value in detn. of C̄ in presence of $CHCl_3$ (3:5050) or of α,α,β-trichloro-*n*-butyraldehyde ("butyrchloral") (3:5910) (38).

By determination of total chlorine as chloride ion. In addition to the reduction methods *(mentioned in the preceding paragraph) for conversion of all the chlorine of C̄ to chloride* ion, this may also be effected by complete hydrolysis with alkali (usually alcoholic alkali best in pressure bottle (39)) (40) (41); for extensive review of methods based on this principle see (22); the total chloride ion is afterward detd. by conventional methods.

By oxidation methods. By appropriate reagents C̄ can be oxidized to trichloroacetic acid (3:1150); by use of a known amount (excess) of standard soln. of oxidant followed by back titration to determine residual oxidant, the amount corresp. to oxidn. of C̄ can be detd. For studies of this method using I_2 (22) (42) (34) (43), Br_2 (42), $KMnO_4$ (42), or $(NH_4)_2S_2O_8$ (44) see indic. refs.

Detection of C̄ by Various Color Reactions

With various phenols. [For color tests with resorcinol (1:1530) + aq. alk. (45), with pyrogallol (1:1555) + 66% H_2SO_4 *(use in distinction from "butyrchloral" (3:5910) (46))*, with phloroglucinol (1:1620) + aq. alkali (47) (49) see indic. refs.]

[For behavior of C̄ with resorcinol (1:1530) + KBr + conc. H_2SO_4 see (52).]

With pyridine + aq. alk. Since C̄ with aq. alk. on warming gives $CHCl_3$ (3:5050), detection of the latter by means of the pink to red color produced with pyridine in pres. of conc. aq. alkali (Fujiwara reaction) may be used as indirect test for C̄ (48) (51). Note, however, that the test is not specific since it is given by various other trihalogen compounds. [For further information on the Fujiwara reaction see also under trichloroethylene (3:5170).]

With fuchsin-aldehyde reagent. Note that C̄ (unlike chloral (3:5210)) does *not* give color with fuchsin-aldehyde reagent (50).

Ⓓ **1,1,1-Trichloro-2-methylpropanol-2 ("Chloretone"):** M.p. 96°. Convert C̄ with aq. alk. to $CHCl_3$ (3:5050) and derivatize the latter by combination with acetone to "chloretone" (3:2662).

57.9° (2)

Colorless hygroscopic lfts. or ndls. from pet. ether; deliquesces in moist air to yield an oil sol. in 20-25 pts. aq. (4). [New comml. prod. (1942) in U.S.A.]

[For prepn. (100% yield (5)) from α,α,β-trichloro-*n*-butyraldehyde hydrate (*n*-butyrchloral hydrate) (3:1905) via actn. of 2 pts. fumg. HNO_3 (D = 1.504) at 30° (5) (6) or with aq. acid solns. of chlorates + cat (8) see indic. refs.; for prepn. from α-chlorocrotonic acid (3:2760) or α-chloro-isocrotonic acid (3:1615) by addn. of Cl_2 see (1).]

$\bar{C}$ with Zn dust and aq. gives excellent yield (5) of α-chlorocrotonic acid (3:2760), m.p. 99-100° (5).

Na$\bar{A}$ on warming (4) or boilg. (3) with aq. dec. into CO_2 and 1,1-dichloropropene-1 (3:5120), b.p. 78°. — Pb$\bar{A}_2$ (7) or Pb$\bar{A}_2$.2H_2O (3) is insol. cold aq., spar. sol. hot aq., but eas. sol. in alc. or ether.

$\bar{C}$ with PCl_5 (3) yields α,α,β-trichloro-*n*-butyryl chloride, b.p. 162-166° (3).

—— Methyl α,α,β-trichloro-*n*-butyrate: unreported.

—— Ethyl α,α,β-trichloro-*n*-butyrate: b.p. 212° (see 3:6380).

—— α,α,β-Trichloro-*n*-butyramide: scales from alc., m.p. 96° (3). [From α,α,β-trichloro-*n*-butyryl chloride (above) with conc. aq. NH_4OH (3).]

—— α,α,β-Trichloro-*n*-butyranilide: unreported

—— α,α,β-Trichloro-*n*-butyr-α-naphthalide: unreported.

[For 1-chloronaphthalene see 3:6875.]

Colorless lfts. from alc.; eas. sol. alc., ether, C_6H_6, $CHCl_3$, CS_2. — *Volatile* with steam.

[For prepn. from β-naphthylamine [Beil. XII-1265, XII_1-(532)] via diazotization and use of Cu_2Cl_2 reaction (yields: 90–95% (17), 82% (15), 75–80% (10)) (3) or even on boilg. diazonium salt soln. with conc. HCl (1) (18), or from diazonium/$ZnCl_2$ cpd. on addn. to phenol at 60° (44% C̄ + 35% hydroxybiphenyl + 13% diphenyl ether (39)), see indic. refs.; from β-naphthol (*1:1540*) with PCl_5 at *135–140°* for 24 hrs. as directed (30% yield (19)) (20) (13) cf. (16) or from *tris*-(β-naphthyl)phosphoric acid dichloride by htg. at 310° (21) or from sodium β-naphtholate with PCl_3 in toluene (55% yield (22)) see indic. refs.; from sodium β-naphthalenesulfonate with PCl_5 via conv. to β-naphthalenesulfonyl chloride and distn. of latter with a second mole of PCl_5 see (13); from mercury *bis*-(β-naphthyl) with $SOCl_2$ see (2); from di-β-naphthyl sulfone with PCl_5 see (23); from 6-chloronaphthoic acid-1 (3:4845) by decarboxylation in quinoline at 225° in pres. of copper chromite cat. see (8); for formn. of C̄ in small proportion from 1-chloronaphthalene (3:6878) by htg. with $AlCl_3$ (9) or from naphthalene dichloride by actn. of alkali (24) see indic. refs.]

[For sepn. of C̄ from 1-chloronaphthalene (3:6878) by fractional freezing of appropriate solutions see (25).]

[For thermal anal. of systems of C̄ with $SbCl_3$ (14) (26) or $SbBr_3$ (14) see indic. refs.; with β-naphthol (1:1540), with β-naphthylamine, or with 2-methylnaphthalene (1:7605) see (5), with PkOH see (11).]

[C̄ with even twice calcd. amt. 5% Na/Hg in alc. for 22 hrs. is *not* reduced but can be recovered almost quant. (27).]

[C̄ with Li in dry ether subsequently treated with Me_2SO_4 gives (43% yield (28)) 2-methylnaphthalene (1:7605). — C̄ with chlorobenzene + Na in xylene refluxed 12 hrs. gives small yield (38) 2-phenylnaphthalene [Beil. V-687], m.p. 101.5° (38).]

[C̄ with strong alc. KOH *in s.t. at 220°* is *unchanged* (13), but C̄ with 5 moles 3–25% aq. NaOH htd. under press. 1 hr. at 350–360° in pres. of Cu gives (29) a mixt. of β-naphthol (1:1540) + α-naphthol (1:1500) cf. (30).]

[C̄ on mononitration as directed (31) gives 2-chloro-8-nitronaphthalene [Beil. V-556], yel. ndls. from alc., m.p. 116° (31) (of the other theoretically possible mononitro C̄ isomers *only the following are known, and these have been prepd. indirectly:* viz., *1-nitro-2-chloro*-naphthalene, m.p. 99–100° (32), 3-nitro-2-chloronaphthalene, m.p. 105° (33), 4-nitro-2-chloronaphthalene, m.p. 79° (34), 5-nitro-2-chloronaphthalene, m.p. 100.5° (37).]

tha-

thor

m.p.

175° (17), and no later work appears to be recorded as to whether these are the same and if so which.]

[C̄ on trinitration, e.g., by soln. in 8 pts. abs. HNO_3 at 0°, or better (38% yield (15)) by addn. of C̄ (2 g.) to a mixt. of abs. HNO_3 (16 ml.) + conc. H_2SO_4 (8 ml.) at 0°, followed by warming as directed, gives 2-chloro-1,6,8-trinitronaphthalene, pale *yel. cryst. from* AcOH, m.p. 193°, white ndls. from C_6H_6, m.p. 194° (15).]

[C̄ on cat. oxidn. with air at 250–300° gives (35) 53% phthalic anhydride (1:0725) + 47% 4-chlorophthalic anhydride (3:2725).]

[For chloromethylation of C̄ with paraformaldehyde + HCl gas in AcOH see (40).]

Ⓓ **2-Chloronaphthalenesulfonamide-8 (7-chloronaphthalenesulfonamide-1)**: cryst. from dil. alc., m.p. 231–232° u.c. (36). [From C̄ with chlorosulfonic acid as directed, followed by conversion of the intermediate 2-chloronaphthalenesulfonyl chloride-8, m.p. 124–126° u.c., with $(NH_4)_2CO_3$ to desired sulfonamide (36).]

—— **2-Chloronaphthalene picrate**: m.p. 81.5° (by thermal anal. *(11)*).

[*See also p-chlorocarvacrol* (3:0480)]

Note that C̄ is also known as 4-chlorothymol (Beilstein) and as 6-chlorothymol (C.A.) according to differing methods of numbering the thymol nucleus.

PREPARATION OF C̄

From thymol. [For prepn. of C̄ from thymol (1:1430) by chlorination with Cl_2 in aq. Na_2CO_3 (80% yield (10)), with Cl_2 in AcOH (50% yield (8)), or with SO_2Cl_2 (1) (9) in $CHCl_3$ (5) see indic. refs.]

From 4-chloro-3-methylphenol (4-chloro-*m*-cresol). [For prepn. of C̄ from 4-chloro-3-methylphenol (3:1535) by conversion with isopropyl alcohol or isopropyl chloride

(3:7025) (11) or with propylene (3) to 4-chloro-3-methylphenyl isopropyl ether and subsequent rearr. (11) (3), e.g., with H_2SO_4/AcOH (6), to C̄, see indic. refs.]

From other sources. [For prepn. of C̄ from 4-amino-2-isopropyl-5-methylphenol via diazotization and use of $CuCl_2/ZnSO_4$ see (4).]

BIOCHEMICAL ASPECTS AND USES OF C̄

C̄ as a halogenated phenol has been widely considered as an antiseptic, bactericide, disinfectant, germicide, fungicide, etc.; while this aspect cannot here be recorded in detail, the following examples may serve as leading references.

[For general and technical articles on bactericidal (12) (13) (14) (15) (16) (17) (18), fungicidal (12) (19) (20) (21), or anthelmintic (22) action of C̄ see indic. refs.; for patents on various means of improving the aqueous solubility of C̄ for use as germicide see (23) (24) (25) (26) (27) (28) (2) (29); for patent on use of C̄ in mouthwash see (30); for use as disinfectant of a mixt. of C̄ (2 pt.) with camphor (1 pt.) (which mixt. is *liquid* above 5°) see (31).]

CHEMICAL BEHAVIOR OF C̄

Reduction. [C̄ in aq. alk. with H_2 + cat. at 180° and 30 atm. (32), or C̄ in aq. alk. with Fe filings at 170° or at 200° under pressure (33) gives (100% yield (32)) thymol (1:1430), *m.p. 51.5°.*]

Oxidation. C̄ on oxidation with CrO_3 (8) or with MnO_2 in ice-cold conc. H_2SO_4 (1) gives thymoquinone (1:9003), m.p. 45.5°.

Reactions Involving Nuclear Substitution of C̄

Bromination. [C̄ with Br_2 in AcOH gives (8) a mixt. of products.]

Nitration. [C̄ in lt. pet. floated on an aqueous soln. of nitrous acid (from $NaNO_2$ + HCl) for a week gave (8) 4-chloro-2-isopropyl-5-methyl-6-nitrophenol [Beil. VI-542, VI_1-(267)], pale yel. ndls. from alc., m.p. 116° (8) (34). — Note that attempts to effect direct nitration of C̄ with HNO_3 in AcOH below 20° (8) give a mixt. of products; also that C̄ in dry $CHCl_3$ at − 20° with NO_2 (from htg. dry $Pb(NO_3)_2$) gives (8) 4-chloro-3,4,6-trinitro-2-isopropyl-5 methyl-cyclohexadien-2,5-one-1 [Beil. VII_1-(100)], yel. cryst., m.p. about 105° dec. (8).]

Mercuration. [*For patents on mercuration of C̄ see (35) (36).*]

Miscellaneous nuclear substitutions. [Note that NaĀ with benzyl chloride (3:8535) in toluene at 110° for 4 hrs. gives (by nuclear benzylation) (37) 4-chloro-6-benzyl-2-isopropyl-3-methylphenol, b.p. 180° at 3 mm. (37).]

[C̄ with SCl_2 in CS_2 gives (65% yield (5)) a sulfide, $C_{20}H_{24}O_2Cl_2S$, m.p. 110–111°, of undetermined structure.]

Reactions Involving the Phenolic Group of C̄

(See also below under Ⓓ's.)

[C̄ with PCl_5 at 180–200° for 2 hrs. gives (9) 2,5-dichloro-p-cymene [Beil. V-423, V_1-(326)], b.p. 240–243°; this prod. on oxidn. with dil. HNO_3 (D = 1.15) in s.t. at 180° for 10 hrs. gives (38) 2,5-dichloroterephthalic acid [Beil. IX-847], m.p. 305° (38) (corresp. *dimethyl ester, m.p. 136° (38)).*]

[For behavior of C̄ with $POCl_3$ giving compds. of types $ROPOCl_2$ and $(RO)_2POCl$ (R = p-chlorothymyl) see (39); for clinical tests of sodium salt of p-chlorothymylphosphoric acid " thymophogen ") with tuberculosis see (40); for prepn. of such salt see (41).]

—— *p*-Chlorothymyl methyl ether: oil, b.p. 251° cor. at 760 mm. (1). [From C̄ with MeI + KOH (1) or from thymyl methyl ether with SO_2Cl_2 (42).]

—— *p*-Chlorothymyl ethyl ether: unreported.

—— *p*-Chlorothymyl acetate: oil, b p. 112–114° at 2 mm. (43). [From C̄ with Ac_2O (9) or AcCl (44); for Fries rearr. to the corresp. acetophenone deriv. see (44) cf. (43).]

Ⓓ *p*-Chlorothymyl benzoate: m.p. 71–73° (9). [From C̄ with BzCl in aq. KOH (9).]

Ⓓ *p*-Chlorothymyl benzyl ether: m.p. 55° (7).

Ⓓ *p*-Chlorothymyl *o*-nitrobenzyl ether: m.p. 117° (7).

—— *p*-Chlorothymyl *p*-nitrobenzyl ether: unreported.

—— *p*-Chlorothymoxyacetic acid: unreported.

3:1300 β-CHLOROISOCROTONIC ACID (*cis*-3-Chlorobuten-2-oic acid-1) $C_4H_5O_2Cl$ Beil. II - 416, II_1-(190), II_2-(396)

```
CH3—C—Cl
    ‖
HOOC—C—H
```

M.P. 62°	(1)	B.P. 194.8° cor. (11)	$D_4^{66.0} = 1.1995$ (7)
61.5°	(2)		$n_D^{66.0} = 1.47039$ (7)
61°	(3) (4) (5) (6) (7) (8)		
60.5°	(9)		
59.5–60.5°	(10)		
59.5°	(11) (17)		

[*See also β-chlorocrotonic acid* (3:2625).]

Cryst. from aq. or pet. ether. — C̄ is somewhat less sol. in aq. than its stereoisomer (3:2625); e g., C̄ is sol. in 52.4 pts. aq. at 19° (12), in 79 pts. aq. at 7° (11). — C̄ is very easily volatile with steam (11) (dif. from β-chlorocrotonic acid (3:2625). — C̄ in either *cis*-α,β-dichloroethylene (3:5042) or *trans*-α,β-dichloroethylene (3:5028) is very much more sol. than the stereoisomeric β-chlorocrotonic acid (3:2625) (13). — C̄ sublimes even at room temp. (11).

For f.p./compn. data and diagram of system C̄ + the stereoisomeric β-chlorocrotonic acid (3:2625) (eutectic, m.p. 38.9° contg. 66.8 mole % C̄) see (14).

Preparation. [The most frequently used method of prepn. of C̄ is that from ethyl acetoacetate (1:1710) with PCl_5; this treatment leads to the formn. of a mixt. of the acid chlorides of C̄ and the stereoisomeric β-chlorocrotonic acid (3:2625) which upon hydrolysis with aq. gives a mixt. of the two acids; from this mixture C̄ is removed (together with any unreacted ethyl acetoacetate) by distillation with steam; the yield of mixed acids is variously reported, e.g., 43.7% (3), 36.5% (9); the yield of C̄ is relatively small, e.g., 26.8% (3), 13% (1). — The PCl_5 reactn. has often been carried out in dry C_6H_6 (8) (15) (9) (3), but its use is regarded (1) as disadvantageous. — For many important details of procedure see indic. refs.]

[For formn. of C̄ from α,β,β-trichloro-*n*-butyric acid (3:0925) by removal of the α- and one β-chlorine atom with Zn see (16); from the stereoisomeric β-chlorocrotonic acid (3:2625) by htg. at 150–160° for 20 hrs. (17) or at 130° in s.t. (18) see indic. refs.]

Chemical behavior. [C̄ in alc. or in aq. NaOH with H_2 + Pd/$BaSO_4$ (4), or C̄ (as NaĀ) with 2½% Na/Hg in aq. (19), yields mainly isocrotonic acid (1:1045) together with some crotonic acid (1:0425) and tetrolic acid, $CH_3—C{\equiv}C—COOH$; note that C̄ is thus dehalogenated more rapidly (4) than the stereoisomeric β-chlorocrotonic acid (3:2625), and that with excess H_2 the products are further reduced to *n*-butyric acid (1:1035).]

C̄ on oxidn. with aq. $KMnO_4$ yields (20) only AcOH (1:1010) and oxalic acid (1:0445).

C̄ with Cl_2 in CS_2 soln. adds 1 mole halogen yielding (16) α,β,β-trichloro-*n*-butyric acid (3:0925), m.p. 52°; C̄ undoubtedly adds 1 Br_2 to yield β-chloro-α,β-dibromo-*n*-butyric acid but the latter has never been reported.

C̄ behaves as a monobasic acid; dissociation const. at 25° = 9.47×10^{-5} (21). — C̄ on neutralization with cold dil. alk. gives Neut. Eq. 120.5. — Note, however, that with strong aq. KOH C̄ is somewhat more resistant than its stereoisomer (3:2625); e.g., C̄ with 3-4 *N* KOH at 115–120° (16) cf. (22) gives acetone (1:5400) + K_2CO_3 + KCl; with 7–8% KOH at 125–130° same + some tetrolic acid.

Salts. [$NH_4H\bar{A}.H_2O$ (11): $Na\bar{A}.½H_2O$, very sol. aq. or alc. (11): $K\bar{A}.H_2O$, sol. in 13.2 pts. alc. at 14° (24): AgĀ, alm. insol. cold aq.; on htg. with aq. in s.t. at 170° dec. much more readily (24) than its stereoisomer (3:2625) into CO_2 + propadiene (allylene):

$Mg\bar{A}_2.5H_2O$, $Ca\bar{A}_2.3H_2O$, $Ba\bar{A}_2.2H_2O$, $Zn\bar{A}_2.2\frac{1}{2}H_2O$, $Mn\bar{A}_2.2H_2O$, $Co\bar{A}_2.6H_2O$, $Ni\bar{A}_2.6H_2O$, all sol. aq. (11): $Pb\bar{A}_2.4H_2O$, spar. sol. aq. (11).]

$\bar{C}$ with PCl_5 (25) or with $SOCl_2$ (26) gives (yield 90% (26)) (29) β-chloroisocrotonyl chloride, b.p. 135–136° at 760 mm.; see also comments under β-chlorocrotonic acid (3:2625).

[$\bar{C}$ (as $K\bar{A}$) with alc. NaOEt on htg. gives after acidification (17) β-ethoxycrotonic acid [Beil. III-371, III_1-(135)], m.p. 137–138° (17), 141° (27); note that during reactn. isomerization has occurred and that this prod. is the same as is similarly obtd. from β-chlorocrotonic acid (3:2625). — $\bar{C}$ (as $Na\bar{A}$) with Na benzylate on htg gives after acidification (28) β-benzyloxycrotonic acid, m.p. 121–122° (28), the same as does the stereoisomer. — $\bar{C}$ (as $Na\bar{A}$) with Na salt of benzyl mercaptan in alc. on htg. gives after acidification (28) β-benzylmercaptoisocrotonic acid, m.p. 130°; note that here isomerization does not occur.]

[For behavior of $\bar{C}$ (as $NH_4\bar{A}$) with $(NH_4)_2SO_3$ yielding β-sulfocrotonic acid (3), or of $\bar{C}$ (as $K\bar{A}$) with K_2AsO_3 yielding (10) β-arsonocrotonic acid, see indic. refs.; note that in both cases the products are identical with those obtd. by similar treatment of β-chlorocrotonic acid (3:2625).]

—— Methyl β-chloroisocrotonate: b.p. 142°. See 3:8028. [For rate of esterification of $\bar{C}$ with MeOH see (30).]

—— Ethyl β-chloroisocrotonate: b.p. 165°. See 3:8325.

Ⓓ *β-Chloroisocrotonamide: lfts. from aq., m p. 109–110° (25).* [From β-chloroisocrotonyl chloride (see above) with conc. aq. NH_4OH (25).] [For study of solubility in *cis*-1,2-dichloroethylene (3:5042) and in *trans*-1,2-dichloroethylene (3:5028) see (13).]

Ⓓ β-Chloroisocrotonanilide: ndls. from alc., m.p. 106° (25) [From β-chloroisocrotonyl chloride (see above) with aniline + excess cold dil. aq. NaOH in 100% yield (25).]

Ⓓ β-Chloroisocroton-α-naphthalide: ndls. from alc., m.p 155° (25). [From β-chloroisocrotonyl chloride (see above) with α-naphthylamine + excess cold dil. aq. NaOH in 100% yield (25).]

MISCELLANEOUS PHYSICAL PROPERTIES OF C̄

Polymorphism of C̄. C̄ is known definitely in the above three α, β, and γ forms and perhaps also in a fourth δ form, m.p. 43.75° (23), although last could not be confirmed (22) cf. (7). — The stable (α) form results from rapid condensation of vapor (23), by crystallization of C̄ from aq. soln. (23), or from rapid cooling of fused C̄ (37), although last method could not be confirmed (25); it is also obtained from the β form by seeding with α (9) or from γ form by spontaneous transformation (20), or from either β or γ forms at −20° (22).

The β form results from cooling fused C̄ especially if melt is first htd. above 67° cf. (9) (23), or from γ form on stirring (23) (20) (37) (22) cf. (25) (7).

The γ form results from fused C̄ on cooling without stirring (23) (20) (37) (25) (7).

[For study of transformation points of α and β forms see (21); for studies of effect of pressure on m p. of C̄ see (38) (39) (25) (8).]

Density and refractive index for fused C̄. [Values for these constants are *not* in good accord, viz., $D_4^{65.4}$ = 1.3978 (40), D_4^{65} = 1.3703 (41); $n_D^{65.4}$ = 1.4301 (40), n_D^{65} = 1.4297 (41). — For D_4^t over range 80°–176° see (36).]

Vapor characteristics. [For study of vapor pressure of C̄ over range 85–180° see (42). — For study of volatility with steam see (43).]

Cryoscopic constant. [Molal f.p. constant for C̄ is 5.2° (for 1000 g. C̄) (44) (37); for studies on use of C̄ as cryoscopic solvent see (44) (45) (46) (47).]

Association of C̄. [For studies on extent of association of C̄ in C_6H_6 soln. at 30° (11), in *p*-chlorotoluene (3:8287) (48), in liquid HF (49), in ether (33), or in water (1–9.7% C̄) (50) see indic. refs]

Heat of combustion. [For studies on heat of combustion of C̄ see (51) (52) (53) (54) cf. (55).]

Exchange reactions. [For study of behavior of C̄ with D_2O see (56); with H_2O^{18} see (57).]

Adsorption of C̄ by various adsorbents. [For studies on adsorption of C̄ from aqueous solns. by various forms of carbon (58) (59) (60) (61) (62) (63) (64), by silica gel (60), by synthetic resins (65), by aniline black (66), by filter paper (67), by hide powder (68), by viscose (69), by $Zr(OH)_2$ (70), or by $Fe(OH)_3$ (71) see indic. refs.]

[For studies on adsorption of C̄ from nonaqueous solvents by wood charcoal (72) or from aqueous alc. by charcoal (73) or by casein (74) see indic. refs.]

Distribution of C̄ between solvents. [For data on distribution of C̄ between *aq. and ether* at 18° (75) or at 25° (76) (77) cf. (81); between *aq. and benzene* at 25° (78) or at an unstated temp. (79); between *aq. and toluene* at 25° (78) (80); between *aq. and isobutyl alcohol* at 25° (80); between *aq. and n-amyl alcohol* at 25° (80); between *aq. and isoamyl alcohol* at 25° (80); between *aq. and di-n-butyl ether* at 25° (5); between *aq. and olive oil* at 25° and 37.5° (82) see indic. refs.]

[For data on distribution of C̄ between *aq. and nitrobenzene* at 25° (80); between *aq. and mixts. of benzene + nitrobenzene* (83); between *aq. and o-nitrotoluene* at 25° (80) (84) see indic. refs.]

[For data on distribution of C̄ between *aq. and $CHCl_3$* (3:5050) at 25° (80) (85) (86); between *aq. and CCl_4* (3:5100) at 25° (80) (87) (85); between *aq. and EtBr* at 25° (80) (77); between *aq. and $CHBr_3$* at 25° (85); between *aq. and MeI* at 25° (80) (87) see indic. refs.]

[For data on distribution of C̄ between *aq. and CS_2* at 25° (85); between *aq. $MgSO_4$ or K_2SO_4 solns. and di-n-butyl ether* at 25° (88) (5); between *acetone and glycerol* at 25° (89) see indic. refs.]

Binary Systems Containing $\bar{C}$

Azeotropic systems. [$\bar{C}$ with *mesitylene* (1:7455) forms a const.-boilg. mixt., b.p. 162° at 760 mm., contg. 17 wt. % $\bar{C}$ (90); $\bar{C}$ with *naphthalene* (1:7200) forms a const.-boilg. mixt., b.p. 187.1° at 760 mm., contg. 78 wt. % $\bar{C}$ (91); $\bar{C}$ with *o-cresol* (1:1400) forms a const.-boilg. mixt., b.p. 187.5° at 760 mm., contg 54 wt. % $\bar{C}$ (91).]

[$\bar{C}$ with 1,1,2,2-*tetrachloroethane* (acetylene tetrachloride) (3:5750) forms a const.-boilg. mixt, b p. 146 25° at 760 mm., contg. 1.8 wt % $\bar{C}$ (91); $\bar{C}$ with *pentachloroethane* (3:5880) forms a const.-boilg. mixt, b.p. 158.65° at 760 mm., contg 9.9 wt. % $\bar{C}$ (91); $\bar{C}$ with *hexachloroethane (3:4835) forms a const.-boilg mixt., b p. 171.2° at 760 mm., contg. 25 wt. %* $\bar{C}$ (27); $\bar{C}$ with 1,2,3-*trichloropropane* (3:5840) forms a const-boilg. mixt., b.p. 154.5° at 760 mm., contg. 10 wt. % (92).]

[$\bar{C}$ with *p-dichlorobenzene* (3:0980) forms a const.-boilg. mixt., b.p. 167.55° at 760 mm., contg. 24 5 wt. % $\bar{C}$ (27); $\bar{C}$ with *benzal (di)chloride* (3:6327) forms a const.-boilg. mixt., b.p. 189.1° at 760 mm, contg. 97 wt. % $\bar{C}$ (93).]

[$\bar{C}$ with *bromobenzene* forms a const.-boilg mixt., b p. 154.3° at 760 mm., contg. 11 wt.% $\bar{C}$ (90); $\bar{C}$ with *p-dibromobenzene* forms a const.-boilg. mixt., b.p. 186 3° at 760 mm, contg. 75 wt. % $\bar{C}$ (93).]

Other Physical Data on Binary Systems Containing $\bar{C}$

$\bar{C}$ + aq. [$\bar{C}$ is very eas. sol. aq. (32); for study of hydration at low temps. see (94); for f p./compn. data see (23). — Data on density of aq $\bar{C}$ is fragmentary but for D^{20}_{20} (40), D^{25}_{25} (95), and D^{35}_{35} (95) for certain concns. see indic. refs. (cf. (96) (97) (98)). — For refractive indices of aq. solns. of $\bar{C}$ see (20) (40) — For study of soly. of aq. in $\bar{C}$ + C_6H_6 see (105).]

$\bar{C}$ + H_2SO_4. [For densities, viscosities, and elec. conductivity at 20°, 40°, and 60° over whole compn. range see (12); for f.p./compn. data over range 46–100% $\bar{C}$ (no compound is formed) see (18).]

$\bar{C}$ + acetic acid. (1:1010) [For f p./compn. data and diag., eutectic m.p. −4.0°, contg. 22 mole % $\bar{C}$, see (99) cf. (100) (103)]

$\bar{C}$ + dichloroacetic acid (3:6208). [For f.p./compn. data (100), eutectic m p. −10.5° contg. 30 7 mole % $\bar{C}$ (101), see indic. refs.]

$\bar{C}$ + trichloroacetic acid (3:1150). [For f.p./compn. data (100), eutectic m p. 17.5° contg. 48.5 mole % $\bar{C}$ (101), see indic. refs.]

$\bar{C}$ + miscellaneous organic compds. of Order 1. [For f.p./compn. data on following systems see indic. refs: $\bar{C}$ + C_6H_6 (1:7400) (103); $\bar{C}$ + *naphthalene* (1:7200) (99) (17) (20); $\bar{C}$ + *phenol* (1:1420) (17) (16) (102); $\bar{C}$ + *o-cresol* (1:1400) (16) (102); $\bar{C}$ + *m-cresol* (1:1730) (16); $\bar{C}$ + *p-cresol* (1:1410) (16); $\bar{C}$ + *α-naphthol* (1:1500) (16); $\bar{C}$ + *β-naphthol* (1:1540) (16); $\bar{C}$ + *thymol* (1:1430) (16); $\bar{C}$ + *guaiacol* (1:1405) (16); $\bar{C}$ + *cetyl alc.* (1:5945) (99); $\bar{C}$ + *meso-erythritol* (1:5825) (14); $\bar{C}$ + *benzoic acid* (1:0715) (100); $\bar{C}$ + *o-toluic acid* (1:0690) (100); $\bar{C}$ + *m-toluic acid* (1:0705) (100); $\bar{C}$ + *p-toluic acid* (1:0795) (100); $\bar{C}$ + *phenylacetic acid* (1:0665) (100); $\bar{C}$ + *cinnamic acid* (1:0735) (100); $\bar{C}$ + *crotonic acid* (1:0425) (100); $\bar{C}$ + *dimethyl oxalate* (1:0415) (103); $\bar{C}$ + *dimethyl succinate* (1:3556) (103); $\bar{C}$ + *methyl cinnamate* (1:2090) (103); $\bar{C}$ + *phenyl salicylate* ("Salol") (1:1415) (99); $\bar{C}$ + *piperonal* (1:0010) (99) (104); $\bar{C}$ + *vanillin* (1:0050) (104); $\bar{C}$ + *acetophenone* (1:5515) (104); $\bar{C}$ + *benzil* (1:9015) (104); $\bar{C}$ + *dibenzalacetone* (1:9021) (104)]

$\bar{C}$ + miscellaneous compounds of Order 2. [For f.p./compn. data on following system see indic. refs.: $\bar{C}$ + *urea* (19); $\bar{C}$ + *ethyl carbamate (urethane)* (19).]

TERNARY SYSTEMS CONTAINING C̄

[For f.p./compn. data and diag. of following systems see indic. refs.: C̄ (α-form) + phenol (1:1420) + naphthalene (1:7200) (17); C̄ (β form) + phenol (1:1420) + naphthalene (1:7200) (17).]

USE OF C̄ IN FOODS AND BEVERAGES

General. [For discussion of use of C̄ as fermentation and oxidn. inhibitor or stabilizer in fruit juices, carbonated beverages, etc. (sometimes as "Esterex" (106)), see (106) (107) (108) (109) (110); for study of persistence of C̄ in such use see (111); for patents on such use see (112); for studies of bactericidal action (113) or fungistatic props. (114) of C̄ see indic. refs.]

Toxicity of C̄. [For studies on toxicity of C̄ see (115) (116).]

Detection and determination of C̄ in foods and beverages. [For studies on detection and detn. of C̄ in commercial preservatives (624), in non-alc. beverages (117) (118) or in wines (119) (120) cf. (117) see indic. refs.: for identification of C̄ as $Ba\bar{A}_2$ (optical and crystallographic props.) see (121) (623).]

PREPARATION OF C̄

From acetic acid. *[For prepn. of C̄ from acetic acid (1:1010) by chlorination at 250-500°* without cat. (625), with Cl_2 in sunlight (32), in light from Hg quartz lamp (122), in silent electric discharge (123), or more usually in presence of catalysts (123) (124) (125) especially sulfur (124) (126) (127) (128) (129), red P (123) (124) (130), iodine (124), mixtures of red P + PCl_5 + I_2 (123) (124) (125) (131) (132) (133) (134), or in acetic anhydride (138) (139) at 100° or in vapor phase over $NiCl_2$ at 350° (140) see indic. refs.]

[For prepn. of C̄ from acetic acid (1:1010) by chlorination with SO_2Cl_2 at 115-120° and 4-5 atm. press. (135) or in pres. of a little acetyl chloride (136) or in presence of dibenzoyl peroxide in CCl_4 (70% yield (137)) see indic. refs.; for formn. of C̄ from AcOH + HCl on electrolysis see (141).]

From trichloroethylene. [For prepn. of C̄ from trichloroethylene (3:5170) with conc. H_2SO_4 at 190-195° see (142) (143) (144) (145) (146); for patents on this process see (147) (148) (149) (150) (151) (152) (153) (154). — Note also that H_2SO_4 may be replaced by arom. sulfonic acids such as benzenesulfonic acid see (155). — Note also that a very similar process (156) starting from *unsym.*-tetrachloroethane (3:5555) doubtless first involves loss of HCl to trichloroethylene.]

From other chloro-compounds. C̄ is also formed by appropriate oxidation of many suitably constituted chloro-compounds [e.g., for formn. of C̄ from 1,2-dichloroethane (ethylene (di)chloride) (3:5130) with dry O_2 in u.v. light see (157)].

[For formn. of C̄ by oxidation of unsaturated chloro-compds. see the following examples: 1,2-dichlorobutene-2, low-boilg. isomer (3:5360), high-boilg. isomer (3:5615) with $KMnO_4$ in acetone (158); 1,4-dichlorobutene-2 (3:5725) with $KMnO_4$ or O_3 (159); 1,2,4-trichlorobutene-2 (3:9062) with aq. $KMnO_4$ (160); 1,4-dichloro-2-methylbutene-2 (3:9204) with O_3 followed by $KMnO_4$ (161); 4-chlorobutadiene-1,2 (3:7225) with aq. alk. $KMnO_4$ (162); 1,3-dichlorohexadiene-2,4 (3:9310) with aq. $KMnO_4$ (163); 3,3,6-trichlorohexadiene-1,4 (3:9308) with aq. $KMnO_4$ (164); 1,3,4,6-tetrachlorohexadiene-2,4 (3:9306) with aq. $KMnO_4$ (164); 3,6-dichlorohexatriene-1,3,4 (3:9304) with aq. $KMnO_4$ (164); 1-chloro-5-methoxypentadiene-2,3 with aq. $KMnO_4$ (165); ethyl 5-chloropenten-3-oate with aq. $KMnO_4$ (166); 1-chloro-5-methoxy-5-phenylpentene-2 with $KMnO_4$ in acetone (35); chloroacetylene (3:7000) with NaOCl (167).]

[For formn. of C̄ from ethylene chlorohydrin (3:5552) by oxidn. with CrO_3 (168); from

1-chloropropanol-2 (propylene α-chlorohydrin) (3:7747) by oxidn. with HNO_3; from 1,3-dichloropropanol-2 (" α-dichlorohydrin ") (3:5985) by oxidn. with conc. HNO_3 (169) cf. (170) see indic. refs.]

[For formn. of $\bar{C}$ from chloroacetaldehyde (3:7212) by oxidn. with conc. HNO_3 (171) cf. (172), AgOH (172) or dil. H_2O_2 (173); from chloroacetone (3:5425) by oxidn. with $KMnO_4$ (161) (174), CrO_3 (174), HNO_3 (174), (175); from 1-chlorobutanone-2 (3:8012) by oxidn. with HNO_3 (176) (177) see indic. refs.]

From aminoacetic acid (glycine). [For formn of $\bar{C}$ from glycine with nitrous acid (40% yield (178)), with conc. HCl + conc. HNO_3 (179), or from glycine hydrochloride with satd. aq. $MgCl_2$, $CaCl_2$, or $ZnCl_2$ + $NaNO_2$ (180), see indic. refs]

From miscellaneous sources. [For prepn of $\bar{C}$ from ketene with Cl_2 in gas phase, CCl_4, or dry ether, followed by aq. (181); from ketene with aq $Ca(OCl)_2$ (182); from formaldehyde + CO + HCl gas at 180° and 800–900 atm. (183), for formn of $\bar{C}$ from α-trioxymethylene with SO_2Cl_2 in pres. of $ZnCl_2$ or $AlCl_3$ in s.t at 150° for 12 hrs (2); from methyl formate (1:1000) with SO_2Cl_2 in s.t. at 165–170° (2); from ethylene with ClO_2 (184); from nitro-trichloromethane (" chlorpicrin ") in AcOH on exposure to light (185) cf. (186) (187) (188)]

[For formn. of $\bar{C}$ from α,β-dichlorovinyl ethyl ether (3.5540) on boilg. with excess aq. see (189) (note, however, that with calcd. amt. aq. ethyl chloroacetate (3:5700) results (190)); for formn. of $\bar{C}$ from *unsym.*-tetrachloroacetone (3:6085) by hydrolytic cleavage with aq. KOH see (191).]

[For formation of $\bar{C}$ from its own derivatives, e g., chloroacetyl chloride (3:5235), chloroacetic acid anhydride (3:0730), methyl chloroacetate (3:5585), ethyl chloroacetate (3:5700), or other esters, etc., see these compds.]

CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis of $\bar{C}$

[$\bar{C}$ on distn. through a red-hot tube decomposes giving (192) HCl + CO + CH_2O (1:0145) + *sym.*-dichlorodimethyl ether (3:5245). — $\bar{C}$ at 250–340° over ThO_2, kaolin, or animal charcoal gives (193) HCl + CO + CO_2, but $\bar{C}$ merely boiled with activated carbon undergoes no decomposition (194).]

[$\bar{C}$ on htg. in tertiary bases such as dimethylaniline (195) or pyridine (196) decomposes into CO_2 + MeCl (3:7005), undoubtedly by way of formn. and decompn. of intermediate quaternary ammonium compds. (betaines) (196).]

[$\bar{C}$ in dry ether or C_6H_6 soln. on exposure to ultra-violet light decomposes giving (197) HCl + fumaric acid (1:0895) + a substance which on shaking with aq yields glycolide (1:0667).]

Reduction of $\bar{C}$

[$\bar{C}$ on reduction in aq. or aq. alc. alk. with H_2 in pres. of Pd or Ni (198) (199) (200), or $\bar{C}$ with chromous sulfate (201), or $\bar{C}$ with finely divided Fe (202), or $\bar{C}$ in aq EtOH in ultra-violet light (203), or $\bar{C}$ on electrolytic reduction (204) gives acetic acid (1:1010). — Note, however, that attempts to effect bimolecular hydrogenation of $\bar{C}$ to succinic acid have been unsuccessful (205).]

Oxidation of $\bar{C}$

[$\bar{C}$ on oxidn. with $K_2S_2O_8$ gives (206) methylene (di)chloride (3:5020); for study of oxidn. of $\bar{C}$ to CO_2 with $K_2S_2O_8$ see (207). — $\bar{C}$ (as Na$\bar{A}$) on electrolysis gives (208) cf. (209) methylene (di)chloride (3:5020), chloromethyl chloroacetate [Beil. II-198, II$_1$-

(193)], and other prods. — For study of photochemical oxidn. of C̄ with $KMnO_4$ in pres. of uranyl salts see (210).]

Reactions Involving Substitution of H Atoms of Alkyl Radical of C̄

Fluorination. The behavior of C̄ with F_2 appears not to have been studied: chloro-fluoroacetic acid is unknown; chloro-difluoroacetic acid [Beil. II-201] although known has been prepd. from difluoroacetic acid by chlorination.

Chlorination. [C̄ with Cl_2 (211) in pres. of I_2 (212) gives dichloroacetic acid (3:6208) very likely accompanied by some trichloroacetic acid (3:1150).]

Bromination. [C̄ with Br_2 at 160° is claimed (213) to give chloro-bromo-acetic acid [Beil. II-217, II_2-(204)], but this is best prepared by other means, e g., from α,β-dichlorovinyl ethyl ether (3:5540) by addn. of Br_2, conversion by distn. to chloro-bromo-acetyl chloride, and hydrolysis (214) (41) (215) (216). — Note that although dibromination of C̄ to chloro-dibromo-acetic acid [Beil. II-220] appears unreported, yet this product is obtd. by other means cf. (217).]

Sulfonation. [C̄ with $ClSO_3H$ on warming (218) or C̄ with SO_3 finally at 70° (219) cf. (220) gives sulfo-chloroacetic acid [Beil. III-598, III_1-(208), III_2-(387)], hygroscopic ndls. of monohydrate from aq., m.p. 83° (219) (corresp. *bis*-acid chloride, oil, b.p. 70° at 3 mm., $D_{-}^{15} = 1.669$, $n_D^{23} = 1.4920$ (121); corresp. N,N,N',N'-tetraphenyldiamide, m.p. 210° (121)), accompanied (218) (220) by some chloromethanedisulfonic acid (chloromethionic acid) [Beil. II-25]. — For resolution of *d,l*-sulfochloroacetic acid see (219).]

Miscellaneous substitution reactions. [C̄ (as KĀ) on boilg. with aq. gives (222) the salt of chloromercuri-chloroacetic acid which with either acid or alk. gives glycolic acid (1:0430).]

Reactions Involving the —COOH Group of C̄

Acidic Strength of C̄

C̄ behaves as a very strong monobasic acid; Neut. Eq. = 94.5. — [Ionization const. of C̄ in aq. at 25° is 1.55×10^{-3} (223) (224), 1.51×10^{-3} (224) (225), 1.396×10^{-3} (226), 1.378×10^{-3} (227). — For examples of other studies of ioniz. const. of C̄ in aq. see (228) (229); for study of temp. variation of ioniz. const. in aq. over range 0–40° see (227) (230); for H^+ conc. of C̄ in aq. solns. (75), in aq. solns. of KCl or NaCl (231) (234), or in buffer mixts. of C̄ + NaĀ (232) (233); for studies of elec. conductivity of C̄ in aq. soln. at 0° (235), at 60° (236), at 62.5° (45), or over range 0–78° (4) see indic. refs. — For discussion of resonance and acid strength of C̄ see (237) (238) (239). — For study of "sourness" of C̄ from taste aspect see (252).]

[Studies of acid strength of C̄ in other solvents include the following: in EtOH (240) (241), in *n*-BuOH (24) (242), in 60% methyl "cellosolve" (ethylene glycol monomethyl ether) (243), in *m*-cresol (242), in ether (244), in formamide (245), in acetonitrile (246), in C_6H_6 (247), in chlorobenzene (248), or in $CHCl_3$ (244). — For studies on electrometric titration of C̄ in C_6H_6 (249), or use of indicators with C̄ in C_6H_6 soln. (250), see indic. refs. — For studies of elec. conductivity of C̄ in MeOH, EtOH, BuOH, acetone see (251).]

Catalytic Effect of C̄ upon Various Reactions

The catalytic influence of C̄ upon diversified types of chem. reaction has been extensively examined; although this matter cannot be recorded exhaustively, the following examples are cited.

[For studies of catalytic effect of C̄ upon the inversion of *l*-menthone to *d*-isomenthone in C_6H_6 (253) or in chlorobenzene (254); upon racemization of methyl-phenyl-acetophenone

and of isobutyl-phenyl-acetophenone in various solvents (255); upon I_2/acetone reaction (224) (234) (256) (257) (232); upon hydrogen disproportionation of limonene (622) see indic. refs.]

[For studies of catalytic effect of $\bar{C}$ upon the hydrolysis of ethyl formate in neutral salt solns. at 25° (258); of EtOAc (259) (235) in pres. of Na$\bar{A}$ or NaCl (259) (225); of sucrose (260) (261) see indic. refs.]

[For studies of catalytic effect of $\bar{C}$ upon formn. of ether from ethyl alcohol (262); upon depolymerization of paraldehyde (273) or of dimeric dihydroxyacetone (263); upon bromination of ethyl acetoacetate (264) see indic. refs.]

[For studies on catalytic effect of $\bar{C}$ upon nitration of toluene (265) (266); upon decompn. of ethyl diazoacetate in C_6H_6 (253) (267); upon decompn. of nitramide (268); upon rearr. of *N*-chloroacetanilide in chlorobenzene soln at 100° (269); upon rearr. of *N*-bromoacetanilide in chlorobenzene, C_6H_6, or ethylene (di)chloride (270); upon rearr. of *N*-iodoformanilide in anisole (271); upon rearr. of *N*-bromobenzanilide in chlorobenzene at 25° (272) see indic. refs.]

Salts of $\bar{C}$

This topic cannot be exhaustively treated here but following examples are cited.

Salts with inorganic bases. [$NH_4\bar{A}$, from $\bar{C}$ in abs. alc. with dry NH_3 gas (274). — Hydroxylamine salt, $HONH_3\bar{A}$, cryst. from boilg. alc., m p. 124–125° (275).]

[Na$\bar{A}$ on electrolysis gives (208) (209) methylene (di)chloride (3:5020), chloromethyl chloroacetate [Beil. II-198, II$_1$-(193)], and other prods.; on htg. gives (276) polyglycolid, for rate of decompn. by aq. see (277). — K$\bar{A}$, $3H_2O$ (32); K$\bar{A}$ 1½H_2O (32) (277) (for study of rate of decompn. by aq. see (277)); K$\bar{A}$.$\bar{C}$, sparingly sol. aq (32). — Ag$\bar{A}$, spar. sol. cold aq., more readily in hot aq. (32); for soly. in HNO_3 see (278); dry htg. gives (279) AgCl + polyglycolid; on htg. with a little aq. gives (279) AgCl + glycolic acid; for prepn. and study of activity coefficient in pres. of electrolytes see (280); for sensitivity to light see (281).]

[Be$\bar{A}_2$, see (293); Mg$\bar{A}_2$.$2H_2O$, very sol. aq. or alc. (277); Ca$\bar{A}_2$.H_2O, very sol. aq. or alc. (277) (for use in eel worm control in soil see (282)); Sr$\bar{A}_2$, spar. sol. aq alc (277); Ba$\bar{A}_2$.H_2O (32) (277) (293) (for use in detn. of $\bar{C}$ see (121) (623)); Cu$\bar{A}_2$, $4H_2O$ (274), Cu$\bar{A}_2$.$3H_2O$ (283), Cu$\bar{A}_2$ (274) cf. (284); for study of electrolysis see (285); for dissoc see (288); for various complexes with NH_3 and amines see (286) (287). — Zn$\bar{A}_2$.2(4?)H_2O (274). — Cd$\bar{A}_2$ $6H_2O$, for prepn. (289), crystallography (290), dissociation (288), and conductivity (291) see indic. refs. — Pb$\bar{A}_2$, spar. sol. cold aq. (274). — Hg$\bar{A}_2$, spar. sol. aq. (292). — $Hg_2\bar{A}_2$, spar. sol. aq. (292).]

[Al$\bar{A}_3$, see (293). — Mn$\bar{A}_2$.$\bar{C}$.H_2O (274); Mn$\bar{A}_2$ $\bar{C}$.$2H_2O$ (274); Mn$\bar{A}_2$ $1.5H_2O$ (289). — Co$\bar{A}_2$.$6H_2O$, m.p. 68–69° (289), for study of complexes with pyridine see (294). — Ni$\bar{A}_2$, $3H_2O$ (274), for complexes with various amines see (295). — For studies on complexes of $\bar{C}$ with iron salts see (274) (296) (297).]

Salts with organic bases (amines). [*Aniline chloroacetate*, m p. 88° (298) (best from $\bar{C}$ in dry ether treated dropwise with aniline in dry ether with cooling (299); note that this salt with P_2O_5 on stdg. gives (299) ω-chloroacetanilide, m p 136° cor.). — *o-Toluidine chloroacetate*, m.p. 95° (300). — *p-Toluidine chloroacetate*, m.p. 97.5° (300) (note that this salt at 80–90° for 2 hrs. (301) or with P_2O_5 (302) gives chloroaceto-*p*-toluidide, m.p. 164° (302)).]

α-Phenylethylamine chloroacetate, from $\bar{C}$ + base in EtOAc, m.p 93.6–94.4° u.c., 94.7–95.5° cor. (303) — *Benzylamine chloroacetate*, from $\bar{C}$ + base in EtOAc, m p. 118.4–119.4° u.c., 119.9–120.9° cor. (303) (note that this m p. is practically identical with corresp benzylamine salt of trichloroacetic acid (3:1150) q v.). — *Piperazine bis-(chloroacetate)*, m.p 145–146° cor. (304). — *Semicarbazide chloroacetate*, m p. 111–112° (305).

Phenylhydrazine chloroacetate, from $\bar{C}$ with phenylhydrazine in C_6H_6, m.p. 111° (306) (note that this product is definitely the salt since on titration with alk. it gives Neut. Eq. 204.7 as against calcd. value of 202.6 (306); however, during detn. of m.p. it is undoubtedly converted to chloroaceto-phenylhydrazide, m.p. 115° (307), directly obtd. from chloroacetyl chloride (3:5235) with phenylhydrazine in ether (307)).

Behavior of Acidic Hydrogen of $\bar{C}$ with Metals

[For study of rate of soln. of Mg in aq. solns. of $\bar{C}$ see (308); for behavior of $\bar{C}$ with Zn see (309); for study of 20% aq. solns. of $\bar{C}$ on silver see (310).]

Esterification of $\bar{C}$

This book includes the following esters of $\bar{C}$ under their own individual numbers q.v.: *methyl chloroacetate* (3:5585), *ethyl chloroacetate* (3:5700), *n-propyl chloroacetate* (3:0565), *isopropyl chloroacetate* (3:8160), *n-butyl chloroacetate* (3:8530), *isobutyl chloroacetate* (3:8375) *sec-butyl chloroacetate* (3:8350), *ter-butyl chloroacetate* (3:8220), *ethylene glycol (mono)-chloroacetate* (3:6780), *ethylene glycol bis-(chloroacetate)* (3:0720), *β-methoxyethyl chloroacetate* (3:9285), *diethylene glycol (mono)chloroacetate* (3:9390), *triethylene glycol (mono)-chloroacetate* (3:9588), and *phenyl chloroacetate* (3:0565).

[For studies of rate of esterification of $\bar{C}$ under various conditions with MeOH (1:6120) (311) (312) (313) (314) (315), with EtOH (1:6130) (312) (313) (1) (316) (317) (318), with isobutyl alc. (1:6165) (319) (320), with amyl alc. (313), or with neopentyl alc. (1:5812) (321) see indic. refs. — For studies on esterification of $\bar{C}$ with alcohols by BF_3 method (312) (322) or without cat. (328) see indic. refs.]

[For patents involving esterification of $\bar{C}$ with alcs. (323) by use of Cl_2 (324) see indic. refs.]

[*For study of use of $\bar{C}$ in esterification of various carbohydrate derivs.* (325) *or of cellulose* (326) cf. (327). — Note that the chemistry of poly (vinyl chloroacetate) cannot be considered here.]

Addition Reactions of $\bar{C}$ with Organic Compounds

Addition to unsaturated linkages. $\bar{C}$ in presence of suitable cat. adds to unsaturated linkages giving the corresp. esters [e g., $\bar{C}$ with propylene + BF_3 at 60–70° gives (34.2% yield (329)) isopropyl chloroacetate (3:8160); $\bar{C}$ with butene-2 + $ZnCl_2$ at 100° for 8 hrs. gives (330) *sec*-butyl chloroacetate (3:8350); similarly $\bar{C}$ with pentene-2 (1:8215) gives (330) diethylcarbinyl chloroacetate, b.p. 177–178°. — Note, however, that no record can be found of reaction of $\bar{C}$ with ethylene to give ethyl chloroacetate (3:5700)].

[$\bar{C}$ with *n*-butylacetylene (hexyne-1) (1:8055) in pres. of HgO + MeOH + $BF_3.Et_2O$ gives (68% yield (331)) 2-(chloroacetoxy)hexene-1, b.p. 100–101° at 20 mm., $D^{25}_{-} = 1.017$, $n_D^{25} = 1.4453$ (331). (For addition of Br_2 to this prod. giving 67% yield 1-bromohexanone-2 + 21% yield chloroacetyl bromide see (334)).]

Addition to epoxy compounds. [$\bar{C}$ with ethylene oxide (1:6105) in dry ether at 0° for 4 days (332) or at 50° under press. for 6 days (333) gives ethylene glycol mono(chloroacetate) (3:6780).]

Conversion of $\bar{C}$ to Corresponding Acyl Halides

Conversion of $\bar{C}$ to chloroacetyl fluoride. [$\bar{C}$ on distn. with fluorosulfonic acid (335) or $\bar{C}$ with KF + benzoyl chloride (3:6240) (336) gives (yields: 30% (336), 15% (335)) chloroacetyl fluoride, b.p. 74° (335), 74–76° (336).]

Conversion of $\bar{C}$ to chloroacetyl chloride. [$\bar{C}$ can by numerous methods be converted

to chloroacetyl chloride (3:5235) q.v. — Note also, however, that $\bar{C}$ with large excess PCl_5 (4 moles) gives (337) tetrachloroethylene (3:5460) and other products.]

Conversion of $\bar{C}$ to chloroacetyl bromide. [$\bar{C}$ with Br_2 + red P (338) (339) or with PBr_3 (340) gives chloroacetyl bromide, b.p. 127° (338) (340), $D^{0}_{-} = 1.840$ (340).]

Conversion of $\bar{C}$ to Corresponding Anhydride

$\bar{C}$ can by numerous methods be converted to chloroacetic acid anhydride (3:0730) q.v.

Reactions Involving the Chlorine Atom of $\bar{C}$

Reduction of $\bar{C}$

See above as second heading under *chemical behavior of* $\bar{C}$.

Hydrolysis of $\bar{C}$ (or its salts)

Hydrolysis of $\bar{C}$ to glycolic (hydroxyacetic) acid (1:0430) together with the formn. under certain conditions of diglycolic acid (1:0495) has been very extensively studied.

Hydrolysis of $\bar{C}$ (or its salts) with aq. $\bar{C}$ on protracted boilg. with aq. (341) (342) (343) or $\bar{C}$ (as $Na\bar{A}$ or $K\bar{A}$) on boiling with aq. (32) (344) (277) or C with aq. $BaCO_3$ (followed by pptn. of barium with H_2SO_4 (345)) gives (88 7% yield (345)) glycolic acid (1:0430).

[For studies on rate of hydrolysis of $\bar{C}$ by aq. under various conditions (626) (342) (343) (346) (347) (348) (349) (350) (351), for study of influence of ultra-violet light (352) (353) (354) (355); for influence of temperature (356); for study of ord. and in heavy aq. (357); for heat of hydrolysis with aq. (358); for study of abnormalities of hydrolysis of salts (359); for study of induction period of hydrolysis (360) (383); for acceleration of hydrolysis by colloidal Ag, Ag_2O, or CuO (349) see indic. refs.]

[For studies of quantum yields of hydrolysis of $\bar{C}$ and use as standard see (361) (362) (363) (364) (365) (366) (367) (353).]

Hydrolysis of $\bar{C}$ (or its salts) with alkalies. $\bar{C}$ on hydrolysis with aq alkalies also gives glycolic acid (1:0430) [for studies of this reaction see (368) (342) (346) (369) (370) (350) (371) (351) (372) (373); for studies of hydrol. of $Na\bar{A}$ by salts of weak acids (374), for study of basic catalysts (375), for effect of high press. (376) see indic. refs.]

[For patents on conversion of $\bar{C}$ to glycolic acid (1:0430) by alkaline hydrolysis see (377) (378); note, however, that the glycolic acid so formed may be converted (379) to glycolid (1:0667).]

Note also that under the influence of the alkaline medium some of the glycolic acid first formed may condense with unreacted $\bar{C}$ to give diglycolic acid (1:0495): for studies of this aspect of the reaction see (380) (381) (382).

Behavior of $\bar{C}$ with NaSH or Its Relatives

[$\bar{C}$ with aq. 15% KSH (384) or with freshly prepd. aq. 15% NaSH (385) at 95° for 1 hr., subsequently acidified with H_2SO_4 and extracted with ether, gives (90% yield (385)) mercaptoacetic acid (thioglycolic acid) {Beil. III-244, III_1-(95), III_2-(175)}, b p. 107-108° at 16 mm. (384) (385), m.p. = −16.5° (384), $D^{20}_{20} = 1.3253$ (384) — Note that this prod. is also preparable by many other methods some of which are cited below.]

[$\bar{C}$ (2 moles) as $Na\bar{A}$ with NaSH as directed (386) (387) (388), or as $K\bar{A}$ with KSH (389) (390), or as $Na\bar{A}$ with potassium sulfantimonite (391) or sodium sulfostannate (391), or as $Ca\bar{A}_2$ with excess $Ca(SH)_2 + H_2S$ (381) gives (84% yield (387)) thiodiglycolic acid (thiodiacetic acid), $S(CH_2COOH)_2$ {Beil. III-253, III_1-(97), III_2-(178)}, cryst. from $AcOEt/C_6H_6$ (1:9) (388) m p. 130° (389), 129° (387) (386).]

[C̄ (2 moles) as NaĀ with aq. Na_2S_2 (392) (393) (394), with alk. or alk.-earth polysulfides (402), with sodium sulfantimonate Na_3SbS_4 (391) or sodium sulfarsenate Na_3AsS_4 (391) gives dithiodiglycolic acid, $HOOC.CH_2—S—S—CH_2COOH$ [Beil. III-254, III_1-(97), III_2-(179)], lfts. from $AcOEt/C_6H_6$ (1:9) (388) 108–109° (391), 106° (388). — Note that this prod. on reduction gives mercaptoacetic acid (above): e.g., for reduction with Sn + HCl (395), with Zn + H_2SO_4 (393) (396) (401) (402), with Na/Hg (397), by electrolytic reduction in H_2SO_4 soln. using Pb electrodes (398), by shaking soln. of sodium salt with Fe powder at 38° under N_2 (399), or by shaking with alanine or phenylalanine in 1% soln. in pres. of active carbon at 38° under N_2 (400) see indic. refs.]

Behavior of C̄ with Various Salts of Inorganic Acids

(For behavior with NaCN, etc., see further below.)

With halides. [C̄ with $HBr.5H_2O$ in s.t. at 150° gives (403) bromoacetic acid [Beil. II-213, II_1-(95), II_2-(201)], m.p. 49–50°, b.p. 208°; however, C̄ in aq. KBr at 50° shows only very slight tendency to formn. of bromoacetic acid (for study of equilibrium see (404)).]

[C̄ with aq. KI at 50° (405) (406), or C̄ with NaI in acetone at room temp. (407) (or in ethyl methyl ketone, diethyl ketone, or AcOEt (407) but *not* in EtOH (408)) gives iodoacetic acid, cryst. from much pet. ether (405) (409), m.p. 83° (405), 82° (406); for study of equilibrium of C̄ with KI in aq. at 50° see (404); of C̄ with KI or NaI in acetone (ionic reaction) see (410).]

With salts of inorganic sulfur, nitrogen, or phosphorus acids. [C̄ with aq. Na_2SO_3 gives (41) (412) salts of sulfoacetic acid [Beil. IV-21, IV_1-(312), IV_2-(531)]; for study of rate of reaction of KĀ with Na_2SO_3, K_2SO_3, or $(NH_4)_2SO_3$ under various conditions see (214) (413).]

[The salts of C̄ with aq. $Na_2S_2O_3$ give the corresp. salts of "glycolic acid thiosulfate" (carboxymethyl hydrogen sulfate) [Beil. III-235, III_1-(97), III_2-(171)]; for studies of this reaction see (414) (415) (416) (417) (418).]

The alkali salts of C̄ with aq. alkali nitrites give the corresp. alkali salts of nitroacetic acid; in fact from a conc. aq. soln. of the potassium nitroacetate, treatment with the calcd. amt. of conc. HCl and extraction with much ether gives (70% yield (419)) (420) free nitroacetic acid [Beil. II-225, II_1-(99), II_2-(207)], m.p. 87–89° dec. (420). — However, even aq. solns. of the alkali salts of nitroacetic acid on warming readily lose CO_2 yielding nitromethane [Beil. I-74, I_1-(19), I_2-(40)], b.p. 100.80–100.86° at 760 mm. (421), f.p. −29.2°, D_4^{25} = 1.1322 (421), n_D^{22} = 1.38056 (421), and although this product is now commercially available from other sources, the reaction is of considerable interest in connection with C̄. — [For studies on the prepn. of nitromethane from KĀ + KNO_2 (yield 47% (422)) (423) (424) or from NaĀ + $NaNO_2$ (yields: 70% (428), 58% (426), 53% (429) (430) (431), 35–38% (425)) see indic. refs. — For studies on rate of decompn. of nitroacetic acid in aq. soln. at 20° (432), in HCl, or in acetate buffered solns. at 17.84° and 9.78° (433) cf. (434) (435) (436) see indic. refs.]

[The behavior of C̄ with NaN_3 appears to be unreported; note, however, that ethyl chloroacetate (3:5700) with NaN_3 gives (437) ethyl azidoacetate [Beil. II-229, II_1-(101), II_2-(208)], which upon hydrolysis with aq. KOH gives (437) azidoacetic acid.]

[For behavior of C̄ with aq. Na_3PO_4 at 85° see (438).]

Behavior of C̄ with Hydrocarbons

C̄ with certain aromatic hydrocarbons or their halogen derivs. at elevated temp. but without cat. condenses with elimination of HCl to give arylated acetic acids [e.g., C̄ with

naphthalene (1:7200) at 180–185° for 48 hrs. gives (439) α-naphthylacetic acid (1:0728)); $\bar{C}$ with 1-chloronaphthalene (3:6878) in generally similar fashion gives (440) 1-chloronaphthalene-?-acetic acid, m.p. 124°; for generally analogous behavior of $\bar{C}$ with acenaphthene, anthracene, fluorene, and even certain phenols and amines see (440).]

Behavior of Chlorine Atom of $\bar{C}$ with Organic OH and SH Reactants

With alkoxides. $\bar{C}$ with excess alkali alkoxides condenses with elimination of alkali chloride to give the corresponding alkoxyacetic acids [e.g., $\bar{C}$ with MeOH/NaOMe (440) (441) or probably also MeOH/Ba(OMe)$_2$ cf. (442) gives methoxyacetic acid (1:1065); $\bar{C}$ with abs. EtOH/NaOEt (2 moles) gives (yields: 93% (441), 90% (443), 74% (444)) ethoxyacetic acid (1:1070); $\bar{C}$ with NaO-n-Pr in n-PrOH gives (64% yield (445)) n-propoxyacetic acid [Beil. III-233, III$_1$-(90), III$_2$-(170)], b.p. 123° at 20 mm. (446), 108° at 10 mm. (445), D_4^{20} = 1.0518 (446), n_D^{22} = 1.42219 (446); $\bar{C}$ with NaO-n-Bu gives (84% yield (445)) (447) n-butoxyacetic acid [Beil. III$_1$-(90), III$_2$-(170)], b.p. 115–116° at 10 mm. (445), 113–114° at 9–10 mm. (447), D_4^{20} = 1.0213 (447), n_D^{20} = 1.42031 (447); $\bar{C}$ with Na isobutylate gives (441) isobutoxyacetic acid [Beil. III-233, III$_1$-(90)], b.p. 118° at 18 mm. (441), 114° at 9 mm. (447), D_4^{20} = 1.0074 (447), n_D^{20} = 1.42001 (446); for analogous behavior of $\bar{C}$ with sodium derivs. of n-amyl alc. (1:6205) (445), n-hexyl alc. (1:6230) (446), n-heptyl alc. (1:6240) (445) (448), n-octyl alc. (1:6255) (445), octanol-2 (1:6245) (446) cf. (449), geraniol (1:6270) (448), l-menthol (1:5940) giving (yields: 78–84% (450), 80% (451), 75% (452)) l-menthoxyacetic acid [Beil. VI$_1$-(25)], m.p. 53–54° (452), benzyl alc. (1:6480) giving (75% yield (453)) (448) benzyloxyacetic acid; etc., see indic. refs.]

With alkali salts of mercaptans. $\bar{C}$ with alkali salts of mercaptans should give the [illegible] have been prepd. by alkylation [illegible] with NaSMe should give methyl- [illegible] mm. (454), 123–124° at 20 mm. [illegible] cpn. has not been reported, the [illegible] m thioglycolate by methylation]. — $\bar{C}$ (as Na$\bar{A}$) with NaSEt in conc. aq. soln. followed by acidification gives (456) ethylmercaptoacetic acid [Beil. III-248, III$_1$-(95)], b.p. 117–118° at 11 mm. (456), 118–119° at 10 mm. (455), m.p. −8.7° (456), D_4^{20} = 1.1497 (456). — [illegible] acid, b.p. 136.5–137° at 18 mm. (455), 132° at 15 mm. [illegible] 1.483 (454), and isopropylmercaptoacetic acid, b.p. 128 [illegible] 9 mm. (455), have been reported only by alkylation of thioglycolic acid. — However, $\bar{C}$ (as Na$\bar{A}$) with Na-S-n-C_4H_9 in aq. soln. gives (yields: 90% (457), 87% (458)) n-butylmercaptoacetic acid, b.p. 144–145° at 14 mm. (455) (corresp. p-bromophenacyl ester, m.p. 95° (458)), for constants on the isomeric isobutyl (455) (459), sec.-butyl (455), and $tert$-butyl (460) mercaptoacetic acids prepd. by other means see indic. refs. — $\bar{C}$ (as Na$\bar{A}$) with NaS-n-C_7H_{15} gives (461) n-heptylmercaptoacetic acid.]

With phenols. $\bar{C}$ (as Na$\bar{A}$) with salts of phenols, or often $\bar{C}$ with phenols in aq. alk. soln., reacts to give the corresp. aryloxyacetic acids; this procedure comprises a valuable tool for derivatization in the identification (462) of phenols. Although the products of reaction of $\bar{C}$ with all possible phenols cannot be recorded here, attention is directed to the 44 aryloxyacetic acids derived from phenols of Order 1 comprising the summary on page 641 of the "Tables of Order 1" (464), and to analogous aryl oxyacetic acids occurring in this present book as follows: o-chlorophenoxyacetic acid (3:4260); m-chlorophenoxyacetic acid (3:3325); p-chlorophenoxyacetic acid (3:4375); 2,4-dichlorophenoxyacetic acid (3:4095); 2,4,5-trichlorophenoxyacetic acid (3:4335). Many other individual cases which cannot be mentioned here may be found by the usual search methods.

Behavior of C̄ with Salts of Organic Acids

With NaCN, KCN, etc. [C̄ on conversion to NaĀ and reaction with aq. NaCN (465) (466) (475) (476) or KCN (467) (468) (469) gives (yields: 75% (469), 70% (468)) cyanoacetic acid (malonic acid mononitrile) [Beil. II-583, II_1-(253), II_2-(530)], m.p. 69–70° (468), 69° (470), 66.1–66.4° cor. (467), 65–66° (471), 65° (472) (473); for use of this reaction in prepn. of malonic acid (1:0480) see (476).]

Note, however, that the behavior of C̄ or its salts with KSCN, NH_4SeN, alkali xanthates, etc., is both complex and disputed and cannot be detailed here.

Behavior of C̄ with NH_3

C̄ with NH_3 under various conditions gives aminoacetic acid (glycine) [Beil. IV-333, IV_1-(462), IV_2-(771)].

[For behavior of C̄ with conc. aq. NH_4OH as method of prepn. of glycine (yields: 66–69% (477), 64–65% (478), 54% (479), 50% (480)) (481) (482) (486) (for numerous older refs. see Beilstein) see indic. refs.: for extensive studies on influence of conditions on this reaction see (483) (477); for study of rate of ammonolysis of C̄ see (484) (485). — For behavior of C̄ with liq. NH_3 see (487); note that C̄ in liq. NH_3 with Na splits out calcd. amt. NaCl and that *no* cyanide is formed (488). — For behavior of C̄ with $(NH_4)_2CO_3$ see (483) (477) (489).]

[Note that reaction of C̄ with NH_3 does not stop with formn. of aminoacetic acid (glycine) but that unchanged C̄ reacts with the latter to give (489) (490) (480) iminodiacetic acid ("diglycolamidic acid") $HN(CH_2COOH)_2$ [Beil. IV-365, IV_1-(481), IV_2-(800)], and/or trimethylamine-α,α',α''-tricarboxylic acid ("triglycolamidic acid") [Beil. IV-369, IV_1-(482), IV_2-(801)], also obtd. from C̄ on fusion with $ZnCl_2/NH_3$ (492).]

Behavior of C̄ with Organic Amines

With primary aliphatic amines. [C̄ with $MeNH_2$ as directed (497) gives (methylamino)-acetic acid (*N*-methylglycine = sarcosine) [Beil. IV-345, IV_1-(468), IV_2-(784)], but this prod. is usually prepd. in other ways. — Note, however, that C̄ (2 moles) with $MeNH_2$ (1 mole) + excess aq. NaOH gives (63–71% yield (493)) (494) methyliminodiacetic acid, $CH_3N(CH_2COOH)_2$ [Beil. IV-367, IV_2-(800)], cryst. from aq. MeOH, m.p. 226–227° dec. (495), 226° dec. (496).]

[*C̄ with excess aq. $EtNH_2$ as directed (498) gives* ethylaminoacetic acid (*N*-ethylglycine) [Beil. IV-349, IV_2-(787)], m.p. 180–182° dec. (499), 181.5° dec. (500). — The homologous *N*-alkylglycines appear never to have been prepared from similar reaction of C̄ with alkylamines, but for prepn. of *N*-(*n*-propyl)glycine [Beil. IV-352], m.p. 196–198° dec. (499), *N*-(isopropyl)glycine [Beil. IV_2-(787)], *N*-(*n*-butyl)glycine, m.p. 192° (501), *N*-(isobutyl)-glycine, m.p. 188° (501), or *N*-(*n*-amyl)glycine, m.p. 201° (501), by other methods see indic. refs.]

With secondary aliphatic amines. [C̄ with aq. Me_2NH (502) (29) for 4 hrs. at 55° under press. (503) or with aq. N
aminoacetic acid (*N*,*N*-d
182° (29), 176–178° (503)
hyde see (505)). — C̄ with Et_2NH similarly gives (506) *N*,*N*-diethylglycine [Beil. IV-350, IV_1-(472)].]

With tertiary aliphatic amines. [C̄ with Me_3N (507) or C̄ (as NaĀ) with Me_3N (508) gives betaine hydrochloride $(CH_3)_3N(Cl).CH_2COOH$ [Beil. IV-347, IV_1-(470), IV_2-(786)].]

With primary aromatic amines. (See also below under Ⓟ's.) [C̄ with aniline in a little ether boiled with a large volume of aq. (509), cf. (511), or C̄ with aniline (3 moles) boiled with aq. and subsequently made alkaline (510), or best C̄ with aq. aniline heated in presence

of an acid acceptor such as aq. NaOH (512), aq. NaOAc (573) cf. (514), or other alkali or alkaline-earth hydroxides or carbonates (515) (516) (517) (518) (519) gives (yields: 100% (514), 90% (516), 86% (512)) phenylaminoacetic acid (*N*-phenylglycine) [Beil. XII-468, XII_1-(263)], m.p. 127° (note that if htd. at 200°, however, bimolecular condensation occurs with elimination of $2H_2O$ and formn. (520) (521) of *N,N'*-diphenyl-2,5-diketopiperazine, m.p. 263° (520) (521) while distn. causes loss of CO_2 giving (522) *N*-methylaniline). — Note also that reaction of $\bar{C}$ with 2 moles aniline (523), or further reaction of $\bar{C}$ with *N*-phenylglycine (above) in aq. alk. (524) (525) (514) (526), gives (yields: 80–85% (526), 50–60% (525)) phenylimino-diacetic acid, $C_6H_5N(CH_2COOH)_2$ [Beil. XII-480, XII_1-(265)], m.p. 152–155° dec. (526). — Note also that reaction of $\bar{C}$ with aniline in pres. of NaOAc gives (525) much *N*-phenylglycine anilide, $C_6H_5NHCH_2CONH.C_6H_5$ [Beil. XII-556], m.p. 112°.]

[Note that $\bar{C}$ with many other primary aromatic amines reacts in analogous fashion, but details cannot be included here because of lack of space.]

With primary aromatic diamines. [$\bar{C}$ with *o*-phenylenediamine in dry ether forms (327) a 1:1 cpd. presumably to be regarded as salt. — However, $\bar{C}$ (1 mole) with *o*-phenylenediamine (1 mole) in 4 *N* HCl refluxed (528) for 45 min. *and allowed to stand overnight* (529) (530) gives (yields: 80–85% (529), 78–86% (530)) 2-(chloromethyl)benzimidazole, ndls. from EtOH/AcOEt (528), pr. from dioxane (529) or dry acetone (530), m.p. 165° (529), 160–161° (528), 159–160° cor. (530), note that value is sensitive to rate of htg. (529) (530). — For studies of behavior of this product with many amines (529) (530), with aq. (530), KI in acetone (530) (531) see indic. refs. — For general study of ortho condensations leading to benzimidazole formn. see (532).]

With hydrazines. [$\bar{C}$ (1 mole) with phenylhydrazine (2 moles) in boilg. aq. alc. K_2CO_3 (½ mole) gives (533) (534) a mixt. of both (α-phenylhydrazino)acetic acid, $C_6H_5N(NH_2)$-CH_2COOH [Beil. XV-316], tbls. from abs. EtOH, m.p. 168° (533), 167° dec. (535), and (β-phenylhydrazino)acetic acid, $C_6H_5NH.NHCH_2COOH$ [Beil. XV-321], lfts. from alc., m.p. 153° (536), 152–153° (537); for separation of these isomers see (533).]

[For behavior of $\bar{C}$ with *N,N*-diphenylhydrazine in aq. Na_2CO_3 or NaOAc see (538).]

With aromatic primary amines also containing other functional groups. *With aminophenols.* [$\bar{C}$ with *p*-aminophenol on htg. in aq. soln. (539) (540) (541) (542) contg. also NaOAc (543) (544) gives (yields: 45% (544), 35% (539) *N*-(*p*-hydroxyphenyl)glycine [Beil. XIII-488, $XIII_1$-(171)] (this product has considerable interest as a photographic developer); for its purification see (540) (545); for pat. on its decompn. at 160–170° in ketone solvents as method of prepn. of *N*-methyl-*p*-aminophenol [Beil. XIII-441, $XIII_1$-(149)] see (546). — Note also that in above reaction of $\bar{C}$ with *p*-aminophenol some *N*-(*p*-hydroxyphenyl)iminodiacetic acid (542) is also formed.]

With amino acids. [$\bar{C}$ with *o*-aminobenzoic (anthranilic) acid in aq. soln. (547) preferably also contg. Na_2CO_3 (548) (549) (550) gives (yields. 85–89% (550), 70–80% (549)) *N*-(*o*-carboxyphenyl)glycine (phenylglycine-*o*-carboxylic acid) [Beil. XIV-348, XIV_1-(544)], ndls. from MeOH, m.p. about 215° dec. (551); this product upon htg. loses CO_2 giving indoxyl and is therefore an important intermediate in mfg. of indigo; for use of this reaction for detection of $\bar{C}$ in wine by conversion to indigo see (120) cf. (117). — Note also that in above reaction of $\bar{C}$ with anthranilic acid some *N*-(*o*-carboxyphenyl)iminodiacetic acid [Beil. XIV-354, XIV_1-(545)], m.p. 216° dec. (551), is also produced (551); although both phenylglycine-*o*-carboxylic acid (Neut. Eq. 97.5) and *N*-(*o*-carboxyphenyl)-iminodiacetic acid (Neut. Eq. 84.3) thus melt at same temp., their mixture melts at about 200° (551).]

With secondary aromatic amines. [$\bar{C}$ with *N*-methylaniline on htg. (552) or better in aq. NaOH on 4-hr. reflux (553) gives (74% yield (553)) *N*-methyl-*N*-phenylglycine [Beil. XII-473, XII_1-(264)], oil (B.HCl, m.p. 215–216° dec. (553)). — $\bar{C}$ with *N*-ethylaniline on

htg. gives (554) *N*-ethyl-*N*-phenylglycine [Beil. XII-475], oil. — $\bar{C}$ with diphenylamine at 180–200° for 40–50 hrs. gives (5–10% yield (555)) *N*,*N*-diphenylglycine [Beil. XII_1-(264)].]

With tertiary aromatic amines. [$\bar{C}$ with dimethylaniline at 100° (556) for 12–18 hrs. (557) gives dimethyl-phenylbetaine hydrochloride [Beil. XII-474], m.p. 194–196° (556), from which silver oxide liberates (557) (558) free dimethyl-phenyl-betaine, m.p. 124–126° (557), 123–124° (558). — For corresp. betaine from *N*,*N*-diethylaniline see (559).]

With tertiary heterocyclic amines. [$\bar{C}$ with pyridine on htg. (560) (561) (194) cf. (556) at 60° for 5 hrs. (557) gives *N*-(carboxymethyl)pyridinium chloride (pyridinebetaine hydrochloride) [Beil. XX-226], m.p. 202–205° dec. (560) (thought by (194) to be typographical error for 102–105° dec.). — For behavior of $\bar{C}$ with quinoline see (556).]

Behavior of $\bar{C}$ with Amides, Thioamides, etc.

This topic cannot here be treated in full, but the following cases are reported as examples.

With urea. [$\bar{C}$ with carbamide (urea) might be expected under appropriate conditions to condense with elimination of HCl and formn. of ureidoacetic acid (hydantoic acid), $NH_2CONH.CH_2COOH$ [Beil. IV-359, IV_1-(477), IV_2-(792)], m.p. 169–170° (562) (563), 160–161° (564), 160° (565), or its ring-closure product hydantoin [Beil. XXIV-242, $XXIV_1$-(287)], m.p. 220°; no report of the chemical behavior of $\bar{C}$ with urea can be found, however, the two above-mentioned expected products having been prepared by other means. — Note that f.p./compn. data on system $\bar{C}$ + urea have been recorded (19).]

With thiourea. [$\bar{C}$ with thiourea (the latter reacting in its isothiourea mode) gives according to conditions either isothiohydantoic acid, $H_2N—C(=NH)—S—CH_2.COOH$ [Beil. III-251, III_1-(97)] (566) (567), or pseudothiohydantoin [Beil. XXVII-233, $XXVII_1$-(303)], (568) (569) (570) (571) (572) (573).]

With substituted thioureas. The behavior of $\bar{C}$ with substituted thioureas cannot be treated in full, but the following examples are cited [for reaction of $\bar{C}$ with various monosubstituted thioureas see (573) (574), with various disubstituted thioureas see (575) (576) (577)].

—— Methyl chloroacetate: oil, b.p. 131° (see 3:5585).

—— Ethyl chloroacetate: oil, b.p. 144° (see 3:5700).

—— Phenyl chloroacetate: m.p. 44–45° (see 3:0565).

—— *o*-Tolyl chloroacetate: oil, b.p. 127–127.6° at 10 mm. (578). [From $\bar{C}$ with *o*-cresol (1:1400) + $POCl_3$ in pyridine (574), or from chloroacetyl chloride (3:5235) with *o*-cresol (1:1400) at 130° for 4 hrs. (578); note that this prod. with $AlCl_3$ at 140° undergoes Fries rearr. giving (578) both 2-hydroxy-3-methylphenacyl chloride [Beil. $VIII_1$-(549)], m.p. 67°, and 4-hydroxy-3-methylphenacyl chloride [Beil. $VIII_1$-(550)], m.p. 144–145°.]

—— *m*-Tolyl chloroacetate: oil, b.p. 153° at 30 mm. (580). [From chloroacetyl chloride (3:5235) with *m*-cresol (1:1730) (579) (580); note that this prod. with $AlCl_3$ at 150° gives (50% yield (580)) 2-hydroxy-4-methylphenacyl chloride [Beil. VIII-113, $VIII_1$-(550)], m.p. 101°.]

—— *p*-Tolyl chloroacetate: m.p. 32° (580), 29–30° (579); b.p. 162° at 45 mm. (580); $D_4^{35} = 1.1840$ (41), $n_D^{35} = 1.5150$ (41). [From $\bar{C}$ with *p*-cresol (1:1410) + $POCl_3$ in pyridine (579), or from chloroacetyl chloride (3:5235) with *p*-cresol (1:1410) at 135° (580); note that this prod with $AlCl_3$ at 140° gives (580) 2-hydroxy-5-methylphenacyl chloride [Beil. VIII-111], m.p. 65° (580).]

—— Benzyl chloroacetate: oil, b.p. 147.5° at 9 mm., $D_4^4 = 1.2223$, $n_D^{18} = 1.5246$ (581). [From $\bar{C}$ with benzyl alc. (1:6480) + HCl gas at 100° (581).]

— *p*-Nitrobenzyl chloroacetate: oil, unsuitable as Ⓓ (582).
— Phenacyl chloroacetate: unreported.
— *p*-Chlorophenacyl chloroacetate: unreported.
Ⓓ *p*-Bromophenacyl chloroacetate: m.p. 103.7° cor. (583).
— *p*-Iodophenacyl chloroacetate: unreported.
Ⓓ *p*-Phenylphenacyl chloroacetate: m.p. 116° (584). [From C̄ (as $Na\bar{A}$) with *p*-phenylphenacyl bromide (584) (m.p. 124.5–125.5°) in aq. alc. on htg. (584).]
Ⓓ *S*-Benzylthiuronium chloroacetate: m.p. 159–160° (585). [Note that for corresp. salts from dichloroacetic acid (3:6208) and trichloroacetic acid (3:1150) m.p. values are respectively 178–179° and 148–149° (585).]
Ⓓ *S*-(*p*-Chlorobenzyl)thiuronium chloroacetate: m.p. 158° cor. (586). [From C̄ (as $Na\bar{A}$) with *S*-(*p*-chlorobenzyl)thiuronium chloride (586) (m.p. 197°) in alc. (586); note that corresp. deriv. of trichloroacetic acid (3:1150) has m.p. 148° cor.]
Ⓓ *S*-(*p*-Bromobenzyl)thiuronium chloroacetate: m.p. 154° cor. (587). [From C̄ (as $Na\bar{A}$) with *S*-(*p*-bromobenzyl)thiuronium bromide (587) (m.p. 213°) in alc. (587); note that corresp. deriv. of trichloroacetic acid (3:1150) has m.p. 146° cor. (587).]
Ⓓ ω-Chloroacetamide: m.p. 120.5–121.5° (588), 120° (589), 119–120° (590), 119.5° (591), 118–120° (165), 118° (312), 116.4–116.9° (620). [From methyl chloroacetate (3:5385) (588) (593) or ethyl chloroacetate (3:5700) (590) (589) (592) (594) (595) (596) (597) with cold conc. NH_4OH (78–84% yield (590)), or from chloroacetyl chloride (3:5235) with dry NH_3 (597).]
Ⓓ ω-Chloroacetanilide: cryst. from hot aq. or 50% alc., m.p. 138° cor. (598), 136–137° (599), 136° cor. (600), 135° (601), 134–135° (602) (166), 134.5° (603) (604), 134° (605) (606), 133–134° (610). [From C̄ with aniline (606) in presence of P_2O_5 (600) (605), from C̄ with aniline salts + PCl_3 or $SOCl_2$ (607), from chloroacetyl chloride (3:5235) with aniline (2 moles) in ether (608) (603), C_6H_6 (602) (601), or AcOH/NaOAc (599) or with aniline (1 mole) + aq. NaOH in C_6H_6 or toluene (609), or from chloroacetic acid anhydride (3:0730) with aniline + P_2O_5 (610).] Note that this ω-chloroacetanilide with $AlCl_3$ (not more than 1.8 pts. (611)) at 225° (611) (612) loses HCl with ring closure giving (85% yield (611) (612)) oxindole [Beil. XXI-282, XXI₁-(289)]; also that ω-chloroacetanilide with alc. KOH undergoes bimolecular condensation giving (613) *N*,*N'*-diphenyl-2,5-diketopiperazine, m.p. 263°.]
Ⓓ ω-Chloroacet-*o*-toluidide: cryst. from dil. alc., m.p. 111–112° (614) (604), 111° (615). [From C̄ + *o*-toluidine + P_2O_5 (615), or from chloroacetyl chloride (3:5235) with *o*-toluidine (2 moles) in dry ether (616) or C_6H_6 (614).] [Note that this prod. with $AlCl_3$ at 225° loses HCl with ring closure giving (612) 7-methyloxindole, m.p. 200°, also that with alc. KOH it undergoes bimolecular condensation giving (614) *N*,*N'*-di-*o*-tolyl-2,5-diketopiperazine.]
Ⓓ ω-Chloroacet-*p*-toluidide: m.p. 164° (615), 162° (608) (617), 161.5° (603). [From C̄ (2 moles) with *p*-toluidine (1 mole) at 80–90° (617) in presence of P_2O_5 (615), or from chloroacetyl chloride (3:5235) with *p*-toluidine (2 moles) (608) in ether (603).] [Note that this prod. with $AlCl_3$ at 230° for 2 hrs. loses HCl with ring closure giving (612) 5-methyloxindole [Beil. XXI-291], m.p. 168° (612).]
— ω-Chloroacet-*N*-benzylamide: cryst. from C_6H_6 or lgr., m.p. 93.5–94.5° cor. (618), 93.0–93.6° cor. (619), 92.2–92.8° u.c. (619). [From ethyl chloroacetate (3:5700) with aq. benzylamine on shaking in cold (619) cf. (621), or from chloroacetyl chloride (3:5235) with benzylamine + aq. KOH (618); note, however, that the corresp. derivs. from dichloroacetic acid (3:6208) and from trichloroacetic acid (3:1150) have almost the same m.p.'s, viz., 93.8–95.6° cor. and 94.6–94.4° cor. respectively (619); note also that the simple salt of C̄ with benzylamine has m.p. 119.9–120.9° cor. (619).]

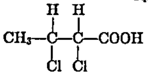
3:1375 α,β-DICHLORO-n-BUTYRIC ACID (low-melting isomer) (Crotonic acid dichloride) $C_4H_6O_2Cl_2$ Beil. II - 279 II_1-(124) II_2—



M.P. 63°	(1) (2) (3) (6)	B.P. 132–133° cor.	at 27 mm.	(5)
		124.5°	at 20 mm.	(6)
62.5–63°	(4)			
62°	(8)	124–125°	at 20 mm.	(1)
61°	(11)	120°	at 13 mm.	(9)
57–59°	(5)			

[*See also α,β-dichloro-n-butyric acid (high-melting isomer) (isocrotonic acid dichloride)* (3:1903).]

Colorless cryst. from pet. ether, lgr. or dry ether. — $\bar{C}$ is eas. sol. alc., C_6H_6, $CHCl_3$, or CS_2; spar. sol. cold lgr.; at 10.5° 3.28 pts. $\bar{C}$ are sol. in 1 part dry ether. — $\bar{C}$ deliquesces with a little aq. (5); $\bar{C}$ with 1 mole H_2O forms (4) an oil, probably a monohydrate (ortho acid), which in much aq. gives an emulsion gradually separating into two clear layers; note, however, that $\bar{C}$ has later (11) been claimed to be nonhygroscopic.

[For prepn. of $\bar{C}$ from crotonic acid (1:0425) with Cl_2 in CS_2 (1) (2) (3) (4) (11) or in $CCl_4 + CS_2$ (6) in cold see indic. refs.; for formn. of $\bar{C}$ from isocrotonic acid (1:1045) with Cl_2 in $CHCl_3$, CCl_4, or CS_2 see (6) (4); for prepn. of $\bar{C}$ from its corresp. acid chloride (see below) by hydrolysis with aq. $NaHCO_3$ see (5) (9).]

$\bar{C}$ boils at 212–216° under ord. press. with some loss of HCl (4).

[$\bar{C}$ with 6 pts. conc. aq. HCl (satd. at 0°) in s.t. at 100° for 50 hrs. (1) is partially isomerized *to the high-melting stereoisomer (isocrotonic acid dichloride) (3:1903).*]

$\bar{C}$ behaves as a fairly strong monobasic acid of ionization const. $K = 8\,2 \times 10^{-3}$ (1); $\bar{C}$ with dil. aq. $AgNO_3$ ppts. the spar. sol. $Ag\bar{A}_2$ (5); no other salts, however, appear to have been reported.

$\bar{C}$ with aq. NaOH in cold is neutralized without serious decomposition (4); Neut. Eq. = 157 (11); however, if to the resulting soln. further conc. aq. NaOH is added (4) (7), or if $\bar{C}$ in alc. is treated with alc. KOH (6) (2), 1 HCl is split away and the corresp. salt of α-chloroisocrotonic acid (3:1615) (accompanied by the salt of its isomeric α-chlorocrotonic acid (3:2760)) is formed.

$\bar{C}$ with aq. Na_2CO_3 at ord. temp. is neutralized without decompn. (4); however, $\bar{C}$ with excess aq. Na_2CO_3 above 80° also is further attacked giving (4) (25–30% yield (4)) 1-chloropropene-1 (3:7030), accompanied by some propionaldehyde (1:0110), α-chlorocrotonic acid (3:2760), α-chloroisocrotonic acid (3:1615), and other products.

$\bar{C}$ in pyridine at 100° for 3 hrs. loses HCl giving (yield not reported (8)) α-chlorocrotonic acid (3:2760), m.p. 99.5° (8).

[$\bar{C}$ with PCl_5 or $SOCl_2$, although not actually reported, would be expected to yield the corresp. acid chloride; this α,β-dichloro-n-butyryl chloride, b.p. 163.3–164.3° cor. at 747 mm. (5), 67.5–71° at 30 mm. (5), has, however, been prepd. indirectly from crotonic acid (1:0425) with PCl_5 (2 moles) at 160° for 2 hrs. (9) or from crotonaldehyde (1:0150) with Cl_2 at 0° in dark (5).]

—— Methyl α,β-dichloro-n-butyrate: b.p. 174–180° sl. dec. at ord. press. (5), 82.7–85.7° cor. at 28 mm. (5); $D_4^{18.3} = 1.2614$ (5). [From the above α,β-dichloro-n-butyryl chloride with MeOH (5).]

—— Ethyl α,β-dichloro-n-butyrate: b.p. 180–200° at 760 mm. (10), 97° at 35 mm. (10), 96° at 35 mm (2). [From C̄ in abs. EtOH with dry HCl (2), or indirectly from butyrchloral hydrate (3:1905) (1 mole) in EtOH with dry KCN (1 mole) below 15° (10); note, however, that this ester loses HCl with great ease even at ord. temp. giving ethyl α-chlorocrotonate (3:8523) and this dehydrohalogenation is greatly accelerated by KCN (10).]

—— α,β-Dichloro-n-butyramide: unreported. [Note that the amide from the higher-melting stereoisomer of C̄ (3:1003) has m p. 121°.]

B.P. 178° at 18 mm. (5)

[*See also trans-1,2-dichloro-1,2-diphenylethylene* (3·4210).]

Colorless ndls — C̄ is much less sol in alc. than its higher-melting stereoisomer (3:4210); 100 pts abs. alc. at 24.4° dis 10 51 pts. C̄ (14). — C̄ like its isomer is very sol. in ether.

Note that C̄ (the lower-melting tolane dichloride) has now been shown (12) to have the *cis* configuration, many earlier reports to the contrary notwithstanding.

Note also that C̄ (2 moles) with (1 mole) diphenylacetylene (tolane) [Beil. V-656, V_1-(319), V_2-(568)], m.p. 60°, gives (12) a 2·1 molecular cpd., m.p. 67–69° (12).

C̄ on distn. is partially transformed (32% (14)) into its higher-melting *trans* stereoisomer (3:4210) q.v.

Since the methods of prepn. and the chemical behavior of C̄ are the same as those given in detail under its stereoisomer (3:4210) q.v they are not repeated here.

Colorless cryst.; eas sol. ether, C_6H_6, lgr , CS_2; spar. sol. cold alc. or 50% AcOH; volatile with steam. [For thermal anal of mixts. of C̄ with 1,2,4-trichlorobenzene (3:6420) or for m.p /compn. data on ternary system of C̄ with 1,2,3-trichlorobenzene (3:0990) and 1,2,4-trichlorobenzene (3:6420) see (9).]

[For use of C̄ in mfg. of electric insulating material see (12) (13).]

[For prepn. of C̄ from 2,4,6-trichloroaniline [Beil. XII-627, XII_1-(312)] via diazotization and reaction with alc. (yield: 92% (14), 90% (15), 72.6% (8), 67% (33)) (4) (1) (16) (17), or from 2,4,6-tribromoaniline [Beil XII-663, XII_1-(329)] via diazotization and subsequent treatment with HCl gas in alc. (18), see indic. refs.; from 3,5-dichloroaniline [Beil. XII-626, XII_1-(312)] via diazotization and reaction with Cu_2Cl_2 or Cu (yield 58% (5), 40–50% (9)) (4) see indic. refs ; from chlorobenzene-3,5-disulfonyl chloride with 4 moles PCl_5 in s.t. at 200–210° for 4 hrs. (60% yield (6)) or similarly from bromobenzene-3,5-disulfonyl chloride (7) see indic. refs.]

[For formn. of C̄ from 2,4,6-trichloroiodobenzene with alc. NaOEt see (19); from 1,3,5-trinitrobenzene with conc. HCl in s.t. at 260° see (20); from 2,4,6-trichloroacetophenone on fusion with KOH (10) or from 2,4,6-trichlorobenzaldehyde on warming with 50% NaOH or KOH (3) see indic. refs ; from chloroacetylene (3:7000) by polymerization in light see (21), for formn. of C̄ from C_6H_6 or chlorobenzene (3:7903) with Cl_2 at 400–700° (22), or from mixt. of *m*- and *p*-dichlorobenzenes with Cl_2 + $AlCl_3$ (23) cf. (24), or from hexachlorobenzene (3:4939) by cat. hydrogenation (25) see indic. refs.; from α-benzene-hexachloride (3:4410) with alc. KOH, pyridine, or quinoline (9) from β- or γ-benzene-hexachlorides with alc. KOH see (9) cf. (26).]

[C̄ with Cl_2 in pres. of Al/Hg yields (27) 1,2,3,5-tetrachlorobenzene (3:0915); for behavior of C̄ with liq. Cl_2 yielding addn. products see (28).]

[C̄ with MeOH/NaOMe in s t. at 180° yields mainly (29) 3,5-dichloroanisole, m.p. 39° (29), accompanied by some 3,5-dichlorophenol (3:1670).]

[C̄ on hydrolysis with steam at 550–800° over cat yields (30) phloroglucinol (1:1620); for behavior of C̄ with F_2 see (31); for behavior of C̄ with NH_3 at 700–800° see (32).]

C̄ on mononitration, e g., by warming C̄ (1 g) with 5 ml fumg. HNO_3 (D = 1.49) at 100° for 15 min., then pouring onto ice (38), gives (2) (8) (100% yield (38)) 1,3,5-trichloro-2-nitrobenzene [Beil. V-247], ndls. from alc., m.p 69° (8), 67–68° (38). — C̄ on dinitration, e g , by refluxing for 1 hr. a soln. of C̄ (1 g.) in 5 ml. fumg. HNO_3 (D = 1.49) + 5 ml. conc. H_2SO_4 (38), gives (yield: 100% (38) (34), 82% (35), 80% (15)) (14) (33) 1,3,5-trichloro-2,4-dinitrobenzene [Beil. V-265], m p 131–131.5° (35) (36), 129–130° (34), 129 5° (14) (15) (3), 128 5° (38) (this prod. on htg. with 5 pts. aniline yields (38) 1,3,5-trianilino-2,4-dinitrobenzene, m.p. 179–180° (38)). — C̄ on trinitration, e g., by boilg. 2 days with mixt. of

fumg. HNO_3 and fumg. H_2SO_4 as directed (37) (39), yields (37) (33) (17) 1,3,5-trichloro-2,4,6-trinitrobenzene [Beil. V-275], m.p. 187° (33), 193° (15), 192–193° (39).

C̄ with conc. H_2SO_4 is unchanged even after htg. 56 hrs. at 100° and is only partially sulfonated on htg. 6 hrs. at 100° with fumg. H_2SO_4 (12% SO_3) (16); however, C̄ with 3 pts. fumg. H_2SO_4 (SO_3 = 72%) htd. at 100° for 15 hrs. completely sulfonates yielding (16) 1,3,5-trichlorobenzene-2,4-disulfonic acid (corresp. disulfonyl chloride, m.p. 161.5° (16), corresp. disulfonamide, m.p. 248° (16)).

C̄ with chlorosulfonic acid in $CHCl_3$ (38) gives 1,3,5-trichlorobenzenesulfonyl chloride, *m.p. 35–40° u.c. (38); this prod. with $(NH_4)_2CO_3$ readily yields (38) 1,3,5-trichlorobenzene*-sulfonamide, m.p. 210–212° u.c. dec. (38).

M.P. 64° (1) (2) (3)
63–64° (5)

Colorless lfts. from alc. — 100 pts. 90–92% alc. dis. at room temp. 5.40 pts. C̄; in hot 37.28 pts. C̄ (4).

[For prepn. of C̄ from chloral (3:5210) with C_6H_6 (2 moles) + conc. H_2SO_4 (almost quant. yield) see (3); from chloral hydrate (3:1270) with C_6H_6 + a little $AlCl_3$ at 0° see (5) cf. (2); note that both types of this same condensation take place through intermediate formn. of trichloromethyl-phenyl-carbinol [Beil. VI-476, VI_1-(237)], m.p. 37°, b.p. 145° at 15 mm. (1) (corresp. acetate, m.p. 87.5° (1)) as formerly suspected (6) and subsequently confirmed (1).]

C̄ on reduction gives various products according to conditions [e.g., C̄ with Na/Hg in

alc. is claimed (7) to give 1,1-diphenylethane [Beil. V-605, V_1-(285), V_2-(509)], but this prod. was not obtd. in pure form and was accompanied by 1,1-dichloro-2,2-diphenylethylene (3:1938) (from $\bar{C}$ by loss of HCl under alk. conditions)].

[$\bar{C}$ in boilg. 95% alc. contg. trace of $CuCl_2$ with finely powdered Al/Cu/Zn (Devarda) alloy or Cu/Mg (Arnd) alloy for 6–10 hrs. gives (13–19% yield (8)) 2,2,3,3-tetrachloro-1,1,4,4 tetraphenylbutane [Beil V_2-(676)], ndls from AcOH, m.p. 188–190° (8), accompanied by some 2,3-dichloro-1,1,4,4-tetraphenylbutene-2 (see next paragraph). $\bar{C}$ with Zn dust + conc. aq. NH_4OH in alc. soln gives (18) (4) stilbene (1:7250) + 1,1-diphenylethane (above).]

[$\bar{C}$ on reduction with H_2 in pres. of Pd/$BaCO_3$ in alc./pyridine soln. gives (54–60% yield (9)) 2,2,3,3-tetrachloro-1,1,4,4-tetraphenylbutane (see preceding paragraph) accompanied by both high-melting (137–138°) and low-melting (108–110°) stereoisomers of 2,3-dichloro-1,1,4,4-tetraphenylbutene-2 [Beil. V_2-(685)]; using Ni as cat. the same prods. result (9) in lower yield sometimes accompanied also by 1,1-dichloro2,2-diphenylethylene (3:1938) (from $\bar{C}$ by loss of HCl)]

[$\bar{C}$ on reduction by electrolytic means in various types of solution, with various metallic electrodes, and at various temperatures gives (10) (11) numerous products including 1,1-dichloro-2,2-diphenylethane (3:1938), 1-chloro-2,2-diphenylethane [Beil V-606, V_1-(285)], 1,1,4,4-tetraphenylbutine-2 [Beil. V_1-(379), V_2-(694)], etc.; for details see (10) (11).]

[$\bar{C}$ with Cl_2 under suitable conditions should give 1,1,1,2-tetrachloro-2,2-diphenylethane [Beil. V-606], m p. 85°, but this reaction has not actually been reported — However, $\bar{C}$ with a very large excess (15 pts.) pure liquid Br_2 gives (12) 2-bromo-1,1,1-trichloro-2,2-diphenylethane, m.p. 87.5° (12)]

[No mono- or di-nitration products derived from $\bar{C}$ have been reported.]

$\bar{C}$ on distillation (13), or on boilg. with alc KOH (2) (14) (for study of rate see (15)), or during course of other reactions involving alkaline conditions (see above) loses HCl giving 1,1-dichloro-2,2-diphenylethylene (3:1938), m.p. 80° (2).

[$\bar{C}$ with NaOEt in s.t. at 180° ultimately gives (2) cf. (16) (and presumably through intermediate 1,1-dichloro-2,2-diphenylethylene (3:1938)) diphenylacetic acid (1:0765).]

$\bar{C}$ with Na in C_6H_6 refluxed 10–12 hrs. and then treated with alc. gives (17) cf. (2) *trans*-1,2-diphenylethylene (stilbene) (1:7250), m.p. 124°, *cis*-1,2-diphenylethylene (isostilbene) [Beil. V-633, V_1-(303), V_2-(539)], and diphenylacetylene (tolane) [Beil. V-656, V_1-(319), V_2-(568)]. — $\bar{C}$ with Zn dust on dry distn. gives (13) stilbene (1:7250).

[$\bar{C}$ in C_6H_6 with $AlCl_3$ gives (10% yield (20)) 1,1,2,2-tetraphenylethane [Beil. V-739, V_1-(371), V_2-(673)], m p. 211°.]

[For use of $\bar{C}$ as addn. agent to improve lubricating power of mineral oils under high pressures see (19).]

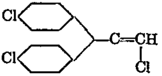
3:1430 1-CHLORO-2,2-*bis*-(*p*-CHLOROPHENYL)ETHYLENE

$C_{14}H_9Cl_3$ Beil. S.N. 480



M.P. 64–65° (1)

Cryst. from lgr. — Note that C̄ may occur as a minor impurity in technical grade " DDT " (3:*3298*).

[For prepn. of C̄ from " *p,p'*-DDD " (3:3320) by elimination of 1 HCl with alc. KOH (77% yield) see (1).]

C̄ on oxidn. with CrO_3 gives (84% yield (1)) 4,4'-dichlorobenzophenone (3:4270).

3:1430 (1) Haller, Bartlett, Drake, Newman, Cristol, et al., *J. Am. Chem. Soc.* **67**, 1600 (1945).

3:1445 α-CHLOROACRYLIC ACID

$CH_2{=}C(Cl){-}COOH$ $C_3H_3O_2Cl$ Beil. I - 401, I₁—, I₂—

M.P. 65° u.c. (1) (4)
64–66° (7)
64–65° (2) (3) (6)

Cryst. from pet. ether (2), ndls. from ether (1). — Eas. volatile, subliming even at room temp. (1) (4); volatile with steam.

[For prepn. of C̄ from α,α-dichloropropionic acid (3:6162) with alc. KOH see (4); from methyl α,β-dichloropropionate (3:9103) with aq. $Ba(OH)_2$ (62% yield (2)) (1) or alc. KOH (5) see indic. refs.; from α-chloro-β-hydroxypropionic acid (α-chlorohydracrylic acid) [Beil. III-298] by distn. with H_2SO_4 see (6) (7); from trichloroethylene (3:5170) with formaldehyde or paraformaldehyde + H_2SO_4 as directed see (3).]

C̄ on treatment with Ag_2O dec. yielding (1) Ag + AgCl.

C̄ with fumg. HCl in s.t. at 100° yields (5) (4) α,β-dichloropropionic acid (3:0855), m.p. 50°.

[The esters of C̄ (usually prepd. from the corresp. alkyl α,β-dichloropropionates by elimination of HCl) have assumed special importance because of their ability to polymerize to useful resins; for methyl α-chloroacrylate see 3:9096; for ethyl α-chloroacrylate see 3:9242; for *sec*-butyl α-chloroacrylate, and its mechanism of polymerization, see (8) (9); for studies on the electrical properties of β-chloroethyl α-chloroacrylate see (10).]

C̄ readily polymerizes in ultra-violet light or in pres. of peroxides (2).

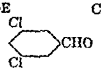
3:1475 3,5-DICHLOROBENZALDEHYDE $C_7H_4OCl_2$ **Beil. S.N. 635**



M.P. 65° (1) **B.P. 235–240°** at 748 mm. (1)

Colorless ndls. or lfts. from pet. ether or dil MeOH (1). — Spar. sol. hot aq. but eas. volatile with steam — Eas. sol. most organic solvents.

[For prepn. of $\bar{C}$ from 3,5-dichlorotoluene (3:6310) via chlorination to 3,5-dichlorobenzal (di)chloride (3:0370) and subsequent hydrolysis with conc. H_2SO_4 (70–80% overall yield) see (1) (4).]

$\bar{C}$ with satd. aq $NaHSO_3$ yields a cpd. $\bar{C}$ $NaHSO_3$; this is exceptionally sol. in aq., and on htg. the soln. yields $\bar{C}$ (1)

$\bar{C}$ on oxidn. with excess $KMnO_4$ at 100° gives (74% yield (1)) 3,5-dichlorobenzoic acid (3:4840), m p. 188° (1). — $\bar{C}$ with 50% aq. KOH for 4 hrs. at 100° gives (90% yield (1)) 3,5-dichlorobenzyl alc., cryst. from C_6H_6, m p. 82° (1), and 3,5-dichlorobenzoic ac. (90% yield (1)) (3:4840).

$\bar{C}$ with PCl_5 gives (80% yield (1)) 3,5-dichlorobenzal (di)chloride (3:0370) cryst. from MeOH or dil. AcOH, m.p. 36.5° (1).

$\bar{C}$ on nitration with fumg. HNO_3 (D = 1.48) at 0° as directed (2) gives (99% *yield* (2)) 3,5-dichloro-2-nitrobenzaldehyde, cryst. from AcOH or lgr., m.p. 91.5° (2), 91° (4). [This deriv. yields an oxime, m.p. 97°, a phenylhydrazone, m.p. 175°, and on oxidn. with $KMnO_4$ gives 3,5-dichloro-2-nitrobenzoic ac., m.p. 194° cor. (2).]

$\bar{C}$ htd. with NaOAc + Ac_2O for 18 hrs. at 180–210° gives (76% yield (1)) 3,5-dichlorocinnamic acid, ndls. from C_6H_6 + pet. eth. or from dil. AcOH, m.p. 176° cor. (1).

[For conversion of $\bar{C}$ to 3,5-dichlorostyrene (5) (6) in a reaction with MeMgI giving (*yields*: 69% (5), 55% (3)) *3,5-dichlorophenyl-methyl-carbinol*, m.p. 46° (3), b.p. 126° at 4 mm. (5), n_D^{20} = 1.5573 (5), and dehydration of latter with $KHSO_4$ (43% yield (5)) see indic. refs.]

Ⓓ **3,5-Dichlorobenzaldoxime:** cryst. from lgr., C_6H_6 + pet. eth., or dil. AcOH, m.p. 112° (1).

Ⓓ **3,5-Dichlorobenzaldehyde phenylhydrazone:** yel. ndls. from pet. eth., m.p. 106.5° (1).

—— **3,5-Dichlorobenzaldehyde *p*-nitrophenylhydrazone:** unrecorded.

—— **3,5-Dichlorobenzaldehyde 2,4-dinitrophenylhydrazone:** unrecorded.

—— **3,5-Dichlorobenzaldehyde semicarbazone:** unrecorded.

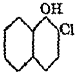
3:1490 2-CHLORONAPHTHOL-1



$C_{10}H_7OCl$ Beil. VI - 611
VI_1-(308)
VI_2-(581)

M.P. 65° (1)
64–65° (2)

Ndls. from lgr.; exceptionally easily sol. in alc., ether, C_6H_6. — More volatile with steam than the isomeric 4-chloronaphthol-1 (3:3720) (use in sepn. (2)).

[For prepn. of Č from α-naphthol (1:1500) with aq. alk. NaOCl (3) (4) (5) or with SO_2Cl_2 in $CHCl_3$ soln. (18% yield, together with 42% yield of 4-chloronaphthol-1 (3:3720) (2)), see indic. refs.; from sodium 1-hydroxynaphthalenesulfonate-2 [Beil. XI-269, XI_1-(63)] with PCl_5 see (6); from 2-chloro-1-hydroxynaphthalenesulfonic acid-4 (1) by hydrolysis in boilg. dil. H_2SO_4 see (1).]

Č on stdg. in aq. Na_2CO_3 soln. gives blue flocks (7).

Č with 1 mole Br_2 in 20% AcOH yields alm. quant. (7) 4-bromo-2-chloro-naphthol-1, ndls., m.p. 112° (7).

[Č with conc. HI ($D = 1.5$) in boilg. AcOH for 12 hrs. reduces (4) to α-naphthol (1:1500), but Č is unaffected by $SnCl_2$ + HCl in alc. even after 28 hrs.' boilg. (4).]

[Č on oxidn. with p-diamines gives (3) indophenols; Č on coupling with diazonium salts gives (3) azo dyestuffs, cf. (1); Č with isatin chloride [Beil. XXI-302, XXI_1-(296)] yields (5) a chloronaphthalene indolindigo.]

[Č dislvd. in a little alc., made ammoniacal with conc. NH_4OH, and treated at 5° with nitrosobenzene in alc. gives (84% yield (8)) 2-chloronaphthoquinone-1,4-monoanil-4 (see under 3:3580), very red ndls. from alc., m.p. 112° (8).

3:1490 (1) Hodgson, Rosenberg, *J. Soc. Chem. Ind.* **48-T**, 287–289 (1929). (2) Lesser, Gad, *Ber.* **56**, 972–973 (1923). (3) Kalle and Co., Ger. 167,458, Jan. 22, 1906; *Cent.* **1906**, I 1067. CHAPTER V

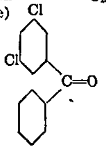
DIVISION A. SOLIDS

(3:1500–3:1999)

3:1505 3,5-DICHLOROBENZOPHENONE $C_{13}H_8OCl_2$ Beil. S.N. 652
(3,5-Dichlorophenyl phenyl ketone)



M.P. 65° (1) (2)

Ndls. (from MeOH (1)).

[For prepn. from 3,5-dichloro-4-aminobenzophenone (1) by removal of amino group via diazo reaction see (1); for prepn. from 3,5-dichlorobenzohydrol by oxidn. with CrO_3 (75% yield) see (2).]

C̄ fused for 3 hrs. at 200° with a mixt. of KOH + NaOH gives (2) BzOH (1:0715) and a trace of *m*-dichlorobenzene (3:5960).

Ⓓ **3,5-Dichlorobenzophenone oxime:** from C̄ in alc. on refluxing 8 hrs. with $NH_2OH.HCl$ + excess NaOH: after distilling off the alcohol, the mixt. of two stereoisomeric oximes is pptd. by pouring into aq.; sepn. of the two isomers can be effected by fractnl. crystn. from dil. MeOH or dil. EtOH (1).

α-form (less-soluble isomer), pl or fine ndls., m.p. 137°. [With PCl_5 in dry ether, followed by water, this form yields quant. 3,5-dichlorobenzanilide, ndls. from dil. alc., m.p. 148° (1).]

β-form (more-soluble isomer), constituting 70% of reaction mixt, pr. m.p. 118°. [With PCl_5 in dry ether, followed by water, this form yields a gummy product from which some benz-3,5-dichloroanilide, ndls. m.p. 148 5°, can be sepd. (1).]

3:1505 (1) Waters, *J. Chem. Soc.* **1929**, 2108–2109. (2) Lock, Rödiger, *Ber.* **72**, 869–870 (1939).

3:1535 4-CHLORO-3-METHYLPHENOL C_7H_7OCl Beil. VI - 381
(4-Chloro-*m*-cresol) VI_1-(187)
VI_2-(355)

M.P. 66°	(1) (11)	B.P. 235°	(1)
57°	(2)	234–236°	(11)
55.5°	(3)		

Note that Č is often designated in the literature as "*p*-chloro-*m*-cresol" or even as "6-chloro-*m*-cresol"; care must be taken to avoid confusion with the isomeric 6-chloro-3-methylphenol (3:0700).

Odorless cryst. (from lgr.). — Volatile with steam (3).

Both the low-melting and high-melting forms appear to be authentic; whether they are different cryst. forms has never been detd.

[For prepn of Č from 2-chloro-5-aminotoluene (4-chloro-3-methylaniline) [Beil. XII-871] via diazo reaction see (3); for comml. prepn. from *m*-cresol (1:1730) by chlorination with SO_2Cl_2 see (1) (4) (84% yield (11)).]

[Č on monobromination with Br_2 in AcOH gives (8) 4-chloro-6-bromo-3-methylphenol, m p. 70.0–70.5° (8); Č on dibromination yields (9) 4-chloro-2,6-dibromo-3-methylphenol, m p 68 5–69.5° (9) (for use of latter in bromometric detn. of Č see (10)).]

Č treated with $(CH_3)_2SO_4$ + aq NaOH gives its methyl ether, 4-chloro-3-methylanisole, b p 213 5° (2). [This methyl ether on oxidn with dil. $KMnO_4$ (6 7 hrs. for 5 g.) gave (2) 2-chloro-5-methoxybenzoic ac [Beil. X-143], ndls. from dil AcOH (5), m.p. 173.5° (2), 170–171° (5), Neut. Eq. 186 5.

Ⓓ **4-Chloro-3-methylphenyl benzoate:** from Č + BzCl + pyridine, pl. from alc., m.p. 86° (2) (3). [This benzoate htd with 0.7 of its wt. of $AlCl_3$ for 10 min. at 140° gives by Fries rearrangement 100% yield (6) of 2-hydroxy-5-chloro-4-methylbenzophenone, yel. ndls. from dil. alc , m p. 142° (6)]

Ⓓ **4-Chloro-3-methylphenyl benzenesulfonate:** from Č + benzenesulfonyl chloride + pyridine, pl. from alc., m p. 66° (3). [Note that this value is numerically the same as orig Č and that the deriv must therefore be distinguished from it, e g , by mixed m p. or behavior with alk.]

Ⓓ **4-Chloro-3-methylphenyl *p*-toluenesulfonate:** from Č + *p*-toluenesulfonyl chloride + pyridine, pl from alc (2) (3), ndls from lt. pet (2), m p. 98° (2) (3). [Note that this deriv does not distinguish Č from 6-chloro-3-methylphenol (3:0700) or 2-chloro-3-methylphenol (3:1035).]

Ⓓ ***4-Chloro-3-methylphenyl N-α-naphthylcarbamate:* *from* Č + *α-naphthyl isocyanate*** in presence of trace of trimethyl- or triethyl-amine in ether; cryst from lgr., m.p. 153–154° (7).

3:1535 (1) Kalle and Co , Jan 11, 1897, Ger. 90,847, *Friedländer* **4**, 94 (1894/7). (2) Gibson, *J. Chem. Soc.* **1926**, 1425–1428. (3) Huston, Chen, *J. Am. Chem. Soc.* **55**, 4214–4218 (1933). 3:1595 2,6-DICHLOROPHENOL $C_6H_4OCl_2$ **Beil. VI - 190**
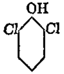
VI_1-(103)
VI_2-(179)



M.P. 67°	**(1) (2)**	**B.P. 219–220°**	at 740 mm.	(2) cf. (3)
66–68°	**(8)**	**80–85°**	at 4 mm.	(2)

Cryst. from pet. eth. with penetrating odor suggesting o-chlorophenol or (if dilute) iodoform. — Misc. with alc., ether, volatile with steam.

[For prepn. from p-hydroxybenzoic ac (1:0840) by chlorination in AcOH followed by elimin. of CO_2 by htg in quinoline see (4) (5) (8); for prepn. from phenol (1:1420) by *prelim. sulfonation*, subsequent chlorination in nitrobenzene, and final removal of sulfonic acid group by hydrolysis (70% yield (2)) see (2).]

C̄ is sol. in Na_2CO_3 soln. (1). [For study of ionization const. see (6).]

C̄ on nitration (no details) gives 2,6-dichloro-4-nitrophenol [Beil. VI-241], colorless ndls. from aq., m.p. 125° (7).

C̄ dislvd. in aq. alk. and shaken with $(CH_3)_2SO_4$ yields (1) (2) the methyl ether, 2,6-dichloroanisole, b.p. *105–106° at 20 mm* (2), m.p. 10 1° (1).

[For study of rearr. of ethers (8) or esters (9) of C̄ see indic. refs.]

—— **2,6-Dichlorophenyl acetate:** b.p. 125–126° at 17 mm., D_{25}^{25} = 1.335, n_D^{23} = 1.5281 (8). [From C̄ with Ac_2O + pyridine (93% yield (8)).]

Ⓓ **2,6-Dichlorophenyl benzoate:** m.p. 74.0–74.5° (9).

—— **2,6-Dichlorophenyl p-nitrobenzoate:** unreported.

—— **2,6-Dichlorophenyl 3,5-dinitrobenzoate:** unreported.

—— **2,6-Dichlorophenyl benzyl ether:** m.p. 39.5–40° (10).

—— **2,6-Dichlorophenyl p-nitrobenzyl ether:** unreported.

Ⓓ **2,6-Dichlorophenoxyacetic acid:** ndls. from aq., m.p. 134 5–135.0° cor. (9). [From C̄ with chloroacetic acid (3:1370) + aq. alk. (9).]

—— **2,6-Dichlorophenyl N-phenylcarbamate:** unreported.

—— **2,6-Dichlorophenyl N-(α-naphthyl)carbamate:** unreported.

—— **2,6-Dichlorophenyl N-(β-naphthyl)carbamate:** unreported.

3:1595 (1) Holleman, *Rec. trav. chim.* **37**, 96–103 (1918). (2) Huston, Neeley, *J. Am. Chem. Soc.* **57**, 2177 (1935). (3) Seifart, *Ann. Suppl.* **7**, 203 (1870). (4) Richardson, *J. Chem. 3:1615 α-CHLOROISOCROTONIC ACID (*cis*-2-Chlorobuten-2-oic acid-1; *allo*-α-chlorocrotonic acid)

$CH_3—C—H$
$\quad\quad\|$
$HOOC—C—Cl$

$C_4H_5O_2Cl$

Beil. II - 415
II_1-(189)
II_2-(396)

M.P. 67.0–67.5° (1)
66–67° (2)
67° (3)
66.2–66.5° (4) (5)
66° (6) (7)

[*See also α-chlorocrotonic acid* (3:2760).]

Ndls. from aq. (2) (4) (5); note, however, that from aq. solns. of salts acidification first ppts. C̄ as an oil. — C̄ is more sol. aq. than its stereoisomer; e.g., C̄ is sol. in 15.3 pts. aq. at 19° (8). — C̄ is much more volatile with steam than its stereoisomer (3:2760) (4) (5). — C̄ is spar. sol. cold but eas. sol. hot lgr. (8).

Preparation. [For prepn. of C̄ from lower-melting form (m.p. 63°) of α,β-dichloro-*n*-butyric acid (3:1375) with excess 10% aq. NaOH at not above 10° see (4) (5) cf. (9).]

Chemical behavior. C̄ on htg. in s.t. at 150–160° for 12 hrs. (10), or with pyridine hydrochloride in pyridine 7 days at room temp. or rapidly at 100° (2), or even slowly on steam distillation (11) is converted to the stereoisomeric α-chlorocrotonic acid (3:2760), m.p. 99°.

C̄ on reduction with Na/Hg in aq. is dehalogenated yielding (12) (4) crotonic acid (1:0425), m.p. 72°; whether any isocrotonic acid (1:1045), b p. 169°, m.p. 15°, is formed at all is uncertain.

C̄ with Cl_2 in CS_2 adds 1 mole halogen yielding (13) the same α,α,β-trichloro-*n*-butyric acid (3:1280), m.p. 59.5–60°, also obtd. by like treatment of α-chlorocrotonic acid (3:2760). — The behavior of C̄ with Br_2 appears to be unreported.

C̄ behaves as a monobasic acid; dissociation const. at 25° is 1.58×10^{-3} (14); Neut. Eq. 120.5.

Salts. [KĀ, ndls. from alc. in which it is much more sol. (viz., 1 pt. KĀ in 22 pts. 99.5% alc. at 16.5° (4)) than its stereoisomer (use in sepn. (2) (9)), eas. sol. aq.; $BaĀ_2$ $3\frac{1}{2}H_2O$, eas. sol. aq. but spar. sol. alc. (8); $PbĀ_2.H_2O$, ppt. (8).]

[*For study of rate of reactn. of C̄ with K_3AsO_3 see (3).*]

The acid chloride of C̄ is unreported.

—— **Methyl α-chloroisocrotonate:** unreported. [*However, for study of rate of esterification of C̄ with MeOH see (15).*]

—— **Ethyl α-chloroisocrotonate:** oil; see 3:9368. [Note also that C̄ in EtOH with conc. H_2SO_4 at 100° gives only (7) the stereoisomeric ethyl α-chlorocrotonate (3:8523).]

—— **α-Chloroisocrotonamide:** unreported.

—— **α-Chloroisocrotonanilide:** unreported.

—— **α-Chloroisocroton-α-naphthalide:** unreported.

	65°	(11) (12)

White cryst. from MeOH, EtOH, lgr., or $CHCl_3$ by addn. of lt. pet. — Note that on distillation under reduced press. C̄ goes over with only slight decompn. as a green vapor which condenses to a green liquid, on solidification much of this color is lost and recrystallization yields colorless C̄. — C̄ is quite stable in dark; in sunlight, however, it turns brown and decomposes.

PREPARATION OF C̄

[For prepn. of C̄ from benzoin (1:5210) with $SOCl_2$ in pyridine (yield 74–79% (9)) (5) or with $SOCl_2$ directly (yield 90% (6)) (2) (3) (10) (13) see indic. refs. — Note that *l*-benzoin with $SOCl_2$ undergoes racemization (7) yielding C̄.]

[For formn of C̄ from α,α-dichlorobenzyl phenyl ketone (*ms,ms*-dichlorodesoxybenzoin) [Beil. VII-436, VII_1-(234)] by partial dehalogenative reduction using H_2 + platinum oxide cat. (65% yield (1)) or AcOH + Fe powder at 70–80° (15) see indic. refs.; from 1,2-diphenyl-1,2-epoxyethylene (diphenyloxene) with conc. HCl in s.t. at 120° for 2 hrs. see (11); from benzoyl-phenyl-diazomethane (azibenzil) [Beil. VII_1-(395)] in ether with HCl gas see (12).]

CHEMICAL BEHAVIOR OF C̄ WITH INORGANIC REAGENTS

Reduction. [C̄ in alc. soln. with H_2 + platinum oxide cat. (1), or in AcOH with Fe powder on protracted treatment (14), gives benzyl phenyl ketone (desoxybenzoin) (1:5165).]

Oxidation. [C̄ with conc. HNO_3 on warming gives (14) dibenzoyl (benzil) (1:9015).]

Halogenation. [C̄ with Br_2 (1 mole) in AcOH at 100° for ½ hr. gives (10) α-bromo-α-chlorobenzyl phenyl ketone, m.p. 85°.]

Behavior with alkalies and alkali carbonates. (For alc. alkalies see below under organic reactants.) — [C̄ with powdered KOH (3 moles) in toluene refluxed 2 hrs. loses HCl and rearranges giving (20% yield (11)) 1,2-diphenyl-1,2-epoxyethylene (diphenyloxene), b.p. 174–180° at 18 mm., m.p. 52°; note, however, that two later workers (15) (29) have been unable to duplicate this report. — Note, however, that C̄ with powdered KOH in dry ether gives (15) a mixt. of benzoic acid (1:0715), diphenylacetic acid (1:0765), desoxybenzoin (1:5165), and benzil (1:9015).]

[C̄ with excess ignited Na_2CO_3 at 200° without solvent for 1 hr. gives (11) a mixt. (yield not stated) of both stereoisomeric 1,2-dibenzoyl-1,2-diphenylethylenes (dibenzoylstilbenes): higher-melting isomer [Beil. VII-844], m.p. 232°; lower-melting isomer [Beil. VII-843, VII_1-(453)], m.p. 212–214°.]

[$\bar{C}$ with NaSH in alc. soln. in cold gives (16) benzoyl-phenyl-carbinyl mercaptan (desylthiol), m.p. 42–44° (benzoyl ester, m.p. 110–112° (16)), accompanied by two forms of didesyl sulfide, one of m.p. 168–169°, the other of m.p. 128–129° (16).]

Behavior with metals. [$\bar{C}$ with Na in C_6H_6 evolves H_2 and on warming gives a mixt. which with aq. followed by dil. acid gives (2) a mixt. of benzoic acid (1:0715) + benzilic acid (1:0770) together with an unidentified neutral oil.]

Behavior with other inorganic reactants. [$\bar{C}$ with moist silver oxide in ethylene glycol at 100° for 3 hrs., then boiled 2 hrs., gives (29) 1,2-dibenzoyl-1,2-diphenylethane (bidesyl) [Beil. VII-841, VII_1-(452)], m.p. 254–255° (29).]

CHEMICAL BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

Behavior with arom. hydrocarbons + $AlCl_3$. [$\bar{C}$ with C_6H_6 (1:7400) + $AlCl_3$ gives (78% yield (17)) (18) (19) ω,ω-diphenylacetophenone (*ms*-phenyldesoxybenzoin = triphenylvinyl alc.) [Beil. VII-522, VII_1-(291)], m.p. 137° (19), 135–136° (17) (18). — $\bar{C}$ with toluene (1:7405) + $AlCl_3$ gives (77% yield (17)) ω-phenyl-ω-(*p*-tolyl)acetophenone (α-(*p*-tolyl)-desoxybenzoin), m.p. 97–98° (17). — $\bar{C}$ with mesitylene (1:7455) + $AlCl_3$ in CS_2 gives (13) ω-phenyl-ω-mesitylacetophenone (α-mesityldesoxybenzoin), m.p. 111–112° (13).] (See also below under reactn. of $\bar{C}$ with RMgX cpds.)

Behavior with organic hydroxy or mercapto compounds. *With alcohols (or alkoxides).* [$\bar{C}$ in MeOH with MeOH/NaOMe gives (80% yield (11)) 1,2-diphenyl-1-methoxy-1,2-epoxyethane, b.p. 194–196° at 16 mm., accompanied by some *cis* + *trans* dibenzoylstilbene (see above).]

[$\bar{C}$ in EtOH with EtOH/NaOEt gives similarly a prod., b.p. 188° at 12 mm., regarded (11) as 1,2-diphenyl-1-ethoxy-1,2-epoxypropane. — Note, however, that $\bar{C}$ in EtOH/NaOEt or with alc. NaOH at 25° gives (5) cf. (1) benzoin (1:5210) and that under certain conditions an apparently intermediate benzoin diethylacetal $C_6H_5CH(OH).C(OC_2H_5)_2.C_6H_5$, m.p. 66–67°, can be isolated (5).]

With phenols (or alkali phenates). [$\bar{C}$ with phenol + anhydrous K_2CO_3 in acetone refluxed 5 hrs. (20) or $\bar{C}$ with Na phenate (21) gives (59% yield (20)) desyl phenyl ether (the phenyl ether of benzoin), m.p. 85.5° (21), 85° (20); note that this prod. is isomeric with, but different from, *ms*-phenylbenzoin [Beil. VIII–211], whose m.p. is almost the same; note also that desyl phenyl ether on attempted distillation at ord. press. undergoes a fission into phenol and a cpd. regarded (21) as 2,2,4,4-tetraphenylcyclobutanedione-1,3, m.p. 244–245°.]

With mercaptans. [$\bar{C}$ + α-mercaptoacetic acid (thioglycolic acid) at 100° for 6 hrs. evolves HCl and yields (22) *S*-desylthioglycolic acid, m.p. 105° (corresp. oxime, m.p. 123°; corresp. semicarbazone, m.p. 178° (22)). — $\bar{C}$ with β-mercaptopropionic acid at 100° for 6 hrs. evolves HCl and yields (16) β-(desylthio)propionic acid, m.p. 108–109°.]

[$\bar{C}$ with thiophenol in EtOH/NaOEt gives in good yield (16) desyl phenyl sulfide, m.p. 83–84° (16), 81° (23). — $\bar{C}$ in MeOH with aq. sodium thiosalicylate gives (22) *S*-desylthiosalicylic acid, m.p. 189°.]

Behavior with carbonyl compounds. [For behavior of $\bar{C}$ with cyclohexanone + sodium in di-*n*-butyl ether see (24).]

Behavior with organic acids (or their salts). [$\bar{C}$ with anhydrous NaOAc in excess Ac_2O refluxed 1 hr. yields (11) mainly the β-stereoisomer, m.p. 153°, of 1,2-diacetoxy-1,2-diphenylethylene [Beil. VI-1026, VI_1-(499)], accompanied by some of the more sol. α-stereoisomer, m.p. 118°.]

[$\bar{C}$ + K thiobenzoate in abs. alc. boiled 10 min. gives (100% yield (16)) desyl thiobenzoate, m.p. 110–112°.]

[$\bar{C}$ in aq. alc. KCN does *not* directly eliminate KCl and give the corresp. desyl cyanide

(*ms*-cyanodesoxybenzoin) [Beil. X-755, X_1-(360)] which might be expected although this compd., m p. 90–92° (25), 89–90° (26), is well known and preparable (yields 60% (25), 47% (26)) from benzyl cyanide + ethyl benzoate and otherwise. — Instead C̄ in aq. alc. KCN loses HCl and gives (27) (28) 1-cyano-1,2-diphenyl-1,2-epoxyethane (α-cyano-α,β-diphenyl-ethylene oxide) which obviously can exist in two geometrically stereoisomeric forms: one has m p 74° (27), 77–78° (28); the other has m.p. 52° (27); for much further detail especially with reference to further reactn prods of these epoxynitriles see (27) (28)]

Behavior of C̄ with RMgBr reactants. (See also above under behavior of C̄ with hydrocarbons + $AlCl_3$.)

[C̄ with C_6H_5MgBr (2 moles) gives (29) (21) the prod. normally to be expected, viz., 1,1,2,2-tetraphenylethanol-1 [Beil VI-732, VI_1-(364)], m p. 236° (21) (30), 230 5° (29); the intermediate ketone, viz., *ms*-phenyldesoxybenzoin (for consts. see above reference) may sometimes (21) be formed, but for discussion of possible alternative mechanisms see (21) (29)]

C̄ with the three tolyl MgBr reactants has been studied, but the reaction is complex and shows no tendency to go way through to the expected tetraarylethanols (only one of which has been reported by any means). — [C̄ with *o*-tolyl MgBr (2 moles) gives (29) a mixt. of prods., including the expected intermediate ketone, viz , *ms*-(*o*-tolyl)desoxybenzoin, m p. 56–57° (32); note, however, that the 1,2-diphenyl-1,2-di-(*o*-tolyl)ethanol-1 which should be the end prod is unknown. — C̄ with *m*-tolyl MgBr gives (29) similarly a mixt. of prods. including the intermediate ketone, viz., *ms*-(*m*-tolyl)desoxybenzoin, m.p 83–84° (32), 82.5–83.5° (29), 82–83° (33), but again the ultimate 1,2-diphenyl-1,2-di-(*m*-tolyl)-ethanol-1 is unknown. — C̄ with *p*-tolyl MgBr (2 moles) gives (31) the ketone *ms*-(*p*-tolyl)desoxybenzoin, m.p. 97–98° (17), 96–97° (31); the ultimate 1,1-diphenyl-1,2-di-(*p*-tolyl)ethanol-1, m.p. 195–196°, has been obtd. by other means (29)]

Behavior of C̄ with amines. *With primary amines* [C̄ (1 mole) with aniline (2 moles) in alc. at room temp. for 24 hrs gives (6) *N*-(desyl)aniline (benzoin anil = *ms*-anilinodesoxybenzoin) [Beil. XIV-103, XIV_1-(395)], m p 99°; note that C̄ with aniline at 140–150° for 1hr. (34) ppts. aniline hydrochloride and leaves a mixt. contg. benzoin-anil = anilide (cf. (35)) since with benzaldehyde at 150–160° for 1 hr. under CO_2 it yields pentaphenyldihydroimidazole (31) — C̄ with p-toluidine in alc at room temp. for 24 hrs gives (3) similarly *N*-(desyl)-*p*-toluidine (*ms*-(*p*-toluidino)desoxybenzoin), m p. 145°]

[For corresp. reactns. of C̄ with *m*-chloroaniline, *p*-chloroaniline, *m*-bromoaniline, *p*-iodoaniline, *p*-aminophenol, *p*-phenetidine, *p*-aminoacetanilide, or ethyl *p*-aminobenzoate see (3), for study of rate of this group of reactns see (4); note that *o*-toluidine, *o*-chloroaniline, and *o*-anisidine do *not* undergo this reactn. (3).]

With secondary amines. [C̄ with Me_2NH (2–3 moles) in alc. in s.t. at 100–110° gives (36) *ms*-(dimethylamino)desoxybenzoin, m.p. 59–61° (36).]

[C̄ (1 mole) with *N*-methylaniline (2 moles) in alc. refluxed 2½ hrs. gives (47% yield (3)) *ms*-(*N*-methyl-*N*-phenylamino)desoxybenzoin, m.p. 100°; if reactants in alc. are stood at room temp. for 100 days, yield is 61% (3).]

[C̄ with piperidine at 100° for 20 min. gives (8) *ms*-(piperidino)desoxybenzoin [Beil. XX_1-(14)], m p. 85–86° (8).]

With phenylhydrazine C̄ (1 mole) with phenylhydrazine (2 moles) in abs alc. at room temp. for 3 days ppts. phenylhydrazine hydrochloride and yields (37) benzil *bis*-(phenylhydrazone) = benzil-phenylosazone, m.p. 233° dec. (37) [cf. under benzil (1:9015)]

Ⓓ *N*-Desylphthalimide [Beil. XXI-480, XXI_1-(374)]: pale yel. cryst. from AcOH. m p. 157–158° (38), 155–156° (39). [From C̄ with K phthalimide at 100° for 2 hrs, (21% yield (39)); note that C̄ + potassium phthalimide in nitrobenzene at 150–160°

for 1½ hrs. gives a mixt. of *N*-desylphthalimide with the lower-melting stereoisomer of dibenzoylstilbene (1,2-dibenzoyl-1,2-diphenylethylene) [Beil. VII-843, VII_1-(453)], m.p. 208° (39) (see also above).]

68° (1)
65° (2) (3) (5) (7)
58° (1)
56° (2) (3) (7) (8) see text

Ndls. from alc.; spar. sol. boilg. alc. (2). — Volatile with steam. — Sublimes.

C̄ shows the double m.p. phenomena also exhibited by several of its isomers; if the fused C̄ in a m p. tube is allowed to cool and then withdrawn from the bath it soon solidifies to a translucent mass which upon immediate reimmersion melts at 58°, but if left for a short time in the air it becomes opaque and then shows m p. 68°; the translucent form rarely persists more than 20 min. (1).

[For prepn of C̄ from 5,8-dichloronaphthylamine-2 [Beil. XII-1310] via diazotization and use of Cu_2Cl_2 reactn. see (4); for prepn. of C̄ from 1,6-dichloro-4-nitronaphthalene [Beil. V-556] (5) (2), from 4,6-dichloronaphthalenesulfonyl chloride-1 [Beil. XI-162] (6), from 4,7-dichloronaphthalenesulfonyl chloride-1 [Beil. XI-163] (7), from 1,4-dichloronaphthalenesulfonyl chloride-7 [Beil. XI-183] (8) (6), from 1-chloro-4-nitronaphthalene-

$\bar{C}$ is readily nitrated; e.g., $\bar{C}$ (16 g.) dislvd. in a soln. of $NaNO_3$ (12 g.) in aq. (180 ml.), treated during 1 hr. at 90–100° by grad. addn. of dil. H_2SO_4 (1:5; 48 ml.), htd. 2 hrs. then steam-distd., gave (3) in distillate 3,5-dichloro-2-nitrophenol (5 g.), lemon-yel. ndls. from pet. ether m.p. 51°, and by repeated hot dil. HCl extraction of tarry residue 3,5-dichloro-4-nitrophenol (6 g.) pale yel. ndls. from aq., m.p. 150° (3). [This latter product also results from the action of nitrous acid (3).]

$\bar{C}$ dislvd. in 4 pts. AcOH and treated with 3 pts. fumg. HNO_3 for ¾ hr. at 70° (2) gives (60% yield (2)) of 3,5-dichloro-2,4,6-trinitrophenol, pale yel. pr. from AcOH, m.p. 139–140° cor. (2).

$\bar{C}$ dislvd. in 5 pts. AcOH gives with Br_2 (as specified (4)) 100% yield of 3,5-dichloro-2,4,6-tribromophenol, cryst. from AcOH, m.p. 189° (4).

$\bar{C}$ dislvd. in aq. NaOH and shaken with $(CH_3)_2SO_4$ gives the methyl ether, 3,5-dichloroanisole, m.p. 39° (6). [The value of 68° given in Ref. 6, p. 104, is probably erroneous.]

Ⓓ **3,5-Dichlorophenyl acetate:** m.p. 38° (5).
Ⓓ **3,5-Dichlorophenyl benzoate:** m.p. 55° (5).

	66–67° cor.	(16)			

Colorless cryst. from lgr. — Ndls. with 1 mole solvate from AcOH, latter lost over CaO (17).

$\bar{C}$ is almost insol. aq.: 1000 g. aq. at 11.2° dis. 0.51 g. $\bar{C}$ (14); at 25.4°, 0.858 g. $\bar{C}$ (14); at 96°, 2.43 g. $\bar{C}$ (14). — $\bar{C}$ is volatile with steam, but not from alk. soln. (difference and sepn. from *o*-chlorophenol (3:5980) or *p*-chlorophenol (3:0475) (18)). — $\bar{C}$ is eas. sol. alc. or ether.

Binary systems contg. $\bar{C}$. — $\bar{C}$ + *nitrobenzene:* this system forms a 1:1 molecular compound, m.p. 31°; this compd. forms with $\bar{C}$ a eutectic, m.p. 28.7° contg. 65 wt. % $\bar{C}$, and with nitrobenzene a eutectic, m.p. + 2.0° contg. 15.5 wt. % $\bar{C}$; for data and f.p./compn. diagram see (13). — $\bar{C}$ + *diphenylamine:* for partial f.p./compn. data and diag. see (19). — $\bar{C}$ + *2,4,6-tribromophenol:* for f.p./compn. data and diag. see (20). — $\bar{C}$ + *α,α,α,α'-tetramethylphthalan:* for study of this system see (15). — $\bar{C}$ + *2,4,6-trinitroresorcinol* (styphnic acid): forms no mol. cpd. but gives a eutectic, m.p. 60° contg. 91.8% $\bar{C}$ (21).

PREPARATION OF C̄

From phenol. *By direct action of chlorine.* [For prepn. of C̄ from phenol (1:1420) with Cl_2 see (3) (for very old initial work cf. (22) (12)); with Cl_2 + aq. alk. (i.e., with NaOCl) see (23) (16) (24).]

By indirect action of chlorine. [For prepn. of C̄ from phenol (1:1420) by chlorination with ethyl *N,N*-dichlorocarbamate (25), with *N,N'*-dichlorourea (26), with conc. HCl + 30% H_2O_2 (27), or with HCl + $KClO_3$ (28) (29) see indic. refs.]

From other phenols or their relatives. [For formn. of C̄ from 2,4,6-trichloro-3-hydroxybenzaldehyde (6) by elimination of the aldehyde group with 50% aq. KOH at 60–70° for 4 hrs. (89.9% yield) see (6); from 2,4,6-trichloro-3-bromophenol (see below) or from 2,4,6-trichloro-3,5-dibromophenol (see below) by replacement of Br by H through use of Zn + AcOH see (9); from 2,4,6-tribromophenol [Beil. VI-203, VI_1-(107)] by replacement of all bromine by chlorine using Cl_2 in AcOH see (30).]

[For formn of C̄ from phenol-*p*-sulfonic acid [Beil. XI-241, XI_1-(55)] (10) or its alkali salts (31) (32) *in aq. soln with Cl_2 (100% yield (10)) see indic. refs.; from aq p-hydroxyazo*benzene [Beil. XVI-96, XVI_1-(233)] (75% yield (11)), from benzyl phenyl ether [Beil. VI-432, VI_1-(220)] (33), from *o*-hydroxybenzyl alcohol (saligenin) (1:1490) (34) with Cl_2 see indic. refs.; from dipotassium salt of salicylic acid (1:6780) with aq. KOCl (4 moles) see (8).]

From other miscellaneous sources. [For formn. of C̄ from aniline in HCl soln. with Cl_2 see (35); from 2,4,6-trichloroaniline via diazotization and subsequent hydrolysis as directed see (7); from indigo [Beil. XXIV-417, $XXIV_1$-(370)] in aq. suspension with Cl_2 see (36) (37); from benzene (1:7400) with Cl_2O see (38); from 2,4,6-trichlorophenyl hypochlorite (see below) by warming with acids or alkalies see (75).]

USES OF C̄ (OR ITS SALTS)

Although the topic cannot here be exhaustively pursued, the bactericidal, fungicidal, and general antiseptic action of C̄ or its salts has attracted much attention [for examples of useful articles in this general connection, see (39) (40) (41) (42) (43) (44) (45) (46); for patents on use of C̄ or its salts in the indicated fields see the following: for use of C̄ (with triaryl phosphates) as wood preservative (47), as preservative for glue (48), as insecticide and fungicide for board-like compns. from vegetable fibers (49), as bactericide (50) (51), as NaĀ for anti-mildew treatment of textiles (52), as textile asst. in mercerization (53); for various complexes contg. C̄ and intended for use as insecticides, etc., see (54) (55) (56)].

CHEMICAL BEHAVIOR OF C̄

Reduction of C̄. [The catalytic hydrogenation of C̄ apparently has not been extensively studied, but it is said (57) to be more stable toward H_2 + $PdCl_2$ than the corresponding 2,4,6-tribromophenol.]

Oxidation of C̄. C̄ on oxidn. gives various products according to circumstances [e.g., C̄ in 2 *N* H_2SO_4 on electrolytic oxidn. gives (58) 2,6-dichlorohydroquinone (3:4600); C̄ on oxidn. with CrO_3/AcOH (59) (60) (61) (62) (63), with cold fumg. HNO_3 (12) (63), with HNO_3/H_2SO_4 (64), with NO + NO_2 in alc. (65) (66) or AcOH (61), or with PbO_2 in AcOH or C_6H_6 (61) gives (*yields: 69% (59), 45% (60), 27% (61)*) 2,6-dichlorobenzoquinone-1,4 (3:3750) (note that this product may be accompanied (61) by more or less 2-chloro-6-(2',4',6'-trichlorophenoxy)benzoquinone-1,4, m.p. 134–135°, and 2,6-*bis*-(2',4',6'-trichlorophenoxy)benzoquinone-1,4, m.p. 245°, which resemble the main prod. in appearance, composition, and behavior (61))].

[$\bar{C}$ on oxidn. with boilg. mixt. of conc. $HNO_3 + HCl$ gives (16) 2,3,5-trichlorobenzoquinone-1,4 (3:4672).]

[$\bar{C}$ on oxidn. with $ClSO_3H$ (67), with Cl_2 + fumg. H_2SO_4 followed by $ClSO_3H$ (68), with aqua regia (69) (70) (72), with $HCl + KClO_3$ (28) (16), with $CrO_3/AcOH$ (71) or $K_2Cr_2O_7/H_2SO_4$ (71) gives (90% yield (68)) 2,3,5,6-tetrachlorobenzoquinone-1,4 (chloranil) (3:4978).]

[For study of oxidn. potential of $\bar{C}$ see (73).]

Nuclear substitution of $\bar{C}$. *Chlorination.* [$\bar{C}$ in HCl suspension with Cl_2 (74) or in AcOH soln. with $Ca(OCl)_2$ (75) gives 2,4,6-trichlorophenyl hypochlorite (2,4,4,6-tetrachlorocyclohexadien-2,5-one-1) [Beil. VII-147, VII_1-(96)], scales from ether/pet. ether, m.p. 122° (75) (10), 121–122° (76), 119° (74).]

[$\bar{C}$ with $Cl_2 + SbCl_5$ at not above 130° gives (77) 2,3,4,4,5,6-hexachlorocyclohexadien-2,5-one-1 ("hexachlorophenol") (3:3180), m.p. 107°.]

[$\bar{C}$ with Cl_2 (3) in pres. of I_2 at 40° (78), or $\bar{C}$ with Cl_2 in CCl_4 in pres. of $FeCl_3$ (79), or $\bar{C}$ with Cl_2 in pres. of $SbCl_3$, I_2, or $FeCl_3$ at 70–75° (80), gives 2,3,4,6-tetrachlorophenol (3:1687), m.p. 69°.]

[$\bar{C}$ with Cl_2 in pres. of $SbCl_3$, I_2, or $FeCl_3$ at 135–140° gives (81) pentachlorophenol (3:4850), m.p. 190°.]

[$\bar{C}$ with $FeCl_3$ (no details) yields (14) 1,2,3,5-tetrachlorobenzene (3:0915), m.p. 51°.]

Bromination. [$\bar{C}$ with Br_2/aq. KBr soln. as directed (82) (83) gives a monobromo derivative of $\bar{C}$ frequently designated as "trichlorophenol bromide"; which of the three structures 4-bromo-2,4,6-trichlorocyclohexadien-2,5-one-1, 2-bromo-2,4,6-trichlorocyclohexadien-2,5-one-1, or 2,4,6-trichlorophenyl hypobromite should be assigned to this prod. has never been decisively settled (83); however, on oxidn. with fumg. HNO_3 it gives (82) 2,6-dichlorobenzoquinone-1,4 (3:3750) and with conc. H_2SO_4 at 100° isomerizes (82) to 3-bromo-2,4,6-trichlorophenol, m.p. 73° (9) (corresp. benzoate, m.p. 117° (82)).]

[$\bar{C}$ with Br_2 (large excess) + Fe powder at room temp. for 24 hrs. gives (100% yield (84)) cf. (85) 3,5-dibromo-2,4,6-trichlorophenol, cryst. from AcOH, m.p. 204° cor. (corresp. methyl ether, m.p. 127°; corresp. benzoate, m.p. 196° (84)).]

Nitration. [The direct nitration of $\bar{C}$ has not been reported, presumably because nitration reagents readily oxidize free $\bar{C}$ to 2,6-dichlorobenzoquinone-1,4 (3:3750) (see above under oxidn. of $\bar{C}$). — However, both possible nitration products have been obtained by indirect means: for 3-nitro-2,4,6-trichlorophenol, m.p. 71–72°, see (86); for 3,5-dinitro-2,4,6-trichlorophenol, m.p. 165–167°, see (87).]

Sulfonation. [$\bar{C}$ with fumg. H_2SO_4 (65% SO_3) at 50° gives (93% yield (88) 2,4,6-trichlorophenolsulfonic acid-3.]

Miscellaneous. [$\bar{C}$ with $SCl_2 + AlCl_3$ in CS_2 or CCl_4 gives (89) a product, m.p. 285°, which may be 3,3'-dihydroxy-2,4,6,2',4',6'-hexachlorodiphenyl sulfide.]

Reactions of the phenolic group of $\bar{C}$. (See also under Ⓓ's below.)

Acidic character of $\bar{C}$. $\bar{C}$ in aq. behaves as an acid and can be titrated with $N/10$ aq. NaOH (3); Neut. Eq. = 197.5. — [Data on dissoc. const. of $\bar{C}$ include the following: in aq. at 25° 1.0×10^{-7} (90), 3.9×10^{-7} (2) cf. (91) (92). — For study of acid strength of $\bar{C}$ in formamide see (93). — For study of exchange reaction of $\bar{C}$ with heavy water see (94).]

Salts of $\bar{C}$. [$NH_4\bar{A}$: spar. sol. cold aq., eas. sol. hot aq. (22), somewhat spar. sol. alc. (24); loses NH_3 in air (12). — $K\bar{A}$, $\frac{1}{2}H_2O$: (24) (12). — $Na\bar{A}$: prepn. (95), behavior with I_2 in various solvents (95) (96), behavior with chloroacetone (3:5425) giving acetonyl 2,4,6-trichlorophenyl ether, m.p. 75° (96).]

$Mg\bar{A}.2H_2O$: eas. sol. aq. (12). — $Ba\bar{A}_2.4H_2O$: spar. sol. aq. (12). — $Pb\bar{A}_2$ (12).

$Ag\bar{A}.H_2O$: yellow (97) [study of decompositions (98) (96) (99)].

Etherification of $\bar{C}$. (See also below under Ⓓ's.)

[C̄ with 1,2-dibromoethane (ethylene dibromide) in alk. soln. gives (100) β-bromoethyl 2,4,6-trichlorophenyl ether, m p. 47–48°. — C̄ with ethylene oxide (1:6105) in alc. NaOEt gives (101) β-hydroxyethyl 2,4,6-trichlorophenyl ether, m.p. 77° (101) (for study of rate of this reaction see (102)) — C̄ (as NaĀ) with benz-o-chlorophenylimino-chloride gives (103) N-(o-chlorophenyl)benzimino 2,4,6-trichlorophenyl ether, m.p. 99–100°, which at 250–270° for 2 hrs rearr. (103) to the N-benzoyl derivative (m.p. 131–132°) of 2,4,6,2'-tetrachloro-diphenylamine. — C̄ with 2,4,6-trichlorobenzyl chloride + NaOH gives (104) 2,4,6-trichlorobenzyl 2,4,6-trichlorophenyl ether, m.p. 101–103°]

Esterification of C̄. (See also below under Ⓓ's.)

[C̄ with $SOCl_2$ in pyridine + C_6H_6 gives (4) *bis*-(2,4,6-trichlorophenyl) sulfite, cryst. from C_6H_6, m p 87–88°; note, however, that this prod is unstable and even within a few hours reverts to C̄.]

[C̄ with PCl_5 in C_6H_6 gives (105) *bis*-(2,4,6-trichloropnenoxy)phosphoryl chloride, $(C_6H_2OCl_3)P(O)Cl$, cryst. from C_6H_6, m.p. 126–129° (105). (Note that C̄ with PCl_5 in s.t. at 200–300° gives also (106) some 1,2,3,5-tetrachlorobenzene (3:0915).) — C̄ (3 moles) with $POCl_3$ (1 mole) refluxed several days gives (107) *tris*-(2,4,6-trichlorophenyl) phosphate, m.p. 201° (107).]

[C̄ (2 moles) with $COCl_2$ (3:5000) in aq. alk. gives (108) *bis*-(2,4,6-trichlorophenyl) carbonate, m.p. 153–154° (109).]

Ⓓ **2,4,6-Trichlorophenyl methyl ether** (2,4,6-trichloroanisole) [Beil. VI-192]: cryst. from alc., m.p. 61–62° (9), 60° (110) (111), 59.5° (112); b p. 240° cor. at 738 mm. (110) cf. (87). [From C̄ with Me_2SO_4 + 15% KOH (87); for crystallographic data see (82); for attempted cleavage with pyridine or piperidine see (113); for nitration see (87)]

Ⓓ **2,4,6-Trichlorophenyl ethyl ether** (2,4,6-trichlorophenetole) [Beil VI-192, VI₁-(104)]: m.p. 43–44° (12), b.p. 246° (12). [From KĀ + EtI (12) or from AgĀ + EtI (98).]

—— **2,4,6-Trichlorophenyl acetate:** oil, b.p. 261–262° (114). [From C̄ with AcCl (114).]

Ⓓ **2,4,6-Trichlorophenyl benzoate** [Beil. IX-117]. m.p. 75.5° (9), 74° (115), 73–74° (6), 70° (14). [From C̄ with benzoyl chloride (3:6240) in pres of aq. NaOH (115) (9); for study of rate of benzoylation of C̄ at 25° and 85° see (116).]

—— **2,4,6-Trichlorophenyl o-nitrobenzoate:** unreported.

—— **2,4,6-Trichlorophenyl m-nitrobenzoate:** unreported.

Ⓓ **2,4,6-Trichlorophenyl p-nitrobenzoate:** m p. 106° (115).

—— **2,4,6-Trichlorophenyl 3,5-dinitrobenzoate:** unreported.

Ⓓ **2,4,6-Trichlorophenyl benzenesulfonate:** m p. 66° (117). [From C̄ with benzenesulfonyl chloride in aq. alk. (117)]

Ⓓ **2,4,6-Trichlorophenyl o-nitrobenzenesulfonate:** m.p. 142° (118). [From C̄ with o-nitrobenzenesulfonyl chloride + K_2CO_3 in acetone (118)]

—— **2,4,6-Trichlorophenyl p-toluenesulfonate:** unreported.

—— **2,4,6-Trichlorophenyl phenyl ether:** unreported.

Ⓓ **2,4,6-Trichlorophenyl 2,4-dinitrophenyl ether:** m.p. 136° (119). [From C̄ with 2,4-dinitrochlorobenzene in alc. alk. (119)]

—— **2,4,6-Trichlorophenyl benzyl ether:** unreported.

—— **2,4,6-Trichlorophenyl p-nitrobenzyl ether:** unreported.

Ⓓ **2,4,6-Trichlorophenoxyacetic acid:** m p 177° (120).

—— **2,4,6-Trichlorophenyl N-phenylcarbamate:** unreported.

Ⓓ **2,4,6-Trichlorophenyl N-(p-bromophenyl)carbamate:** pl. from C_6H_6 + EtOAc, m p. 162–164° cor. (121). [From C̄ with p-bromobenzazide (121) in lgr. (121).]

Ⓓ **2,4,6-Trichlorophenyl N-(p-iodophenyl)carbamate:** m p. 172–173° (122). [From C̄ with p-iodobenzazide (122) in lgr. (122).]

Ⓓ 2,4,6-Trichlorophenyl *N*-(*m*-nitrophenyl)carbamate: white rods from lgr., m.p. 165–167° u.c.; 169–170° cor. (123). [From C̄ with *m*-nitrobenzazide (123) in lgr. (123).]

Ⓓ 2,4,6-Trichlorophenyl *N*-(*p*-nitrophenyl)carbamate: pale yel. rods from lgr., m.p. 166° cor. (124). [From C̄ with *p*-nitrobenzazide (124) in lgr. (124).]

—— 2,4,6-Trichlorophenyl *N*-(3,5-dinitrophenyl)carbamate: unreported.

Ⓓ 2,4,6-Trichlorophenyl *N*-(3,5-dinitro-4-methylphenyl)carbamate: yel. pr. from lgr. or EtOAc, m.p. 195–196° u.c., 201–202° cor. (125). [From C̄ with 3,5-dinitro-4-methylbenzazide (125) in lgr. (125).]

—— 2,4,6-Trichlorophenyl *N*-(α-naphthyl)carbamate: unreported.

Ⓓ 2,4,6-Trichlorophenyl *N*-(β-naphthyl)carbamate: pr. from lgr., m.p. 157–158° u.c., 161–162° cor. (126). [From C̄ with β-naphthyl isocyanate (126) or β-naphthazide (126) in lgr. (126).]

Ⓓ 2,4,6-Trichlorophenyl *N,N*-diphenylcarbamate: m.p. 143° (127). [From C̄ with *N,N*-diphenylcarbamyl chloride (127).]

3:1676 DECACHLORODIETHYL ETHER (*bis*-(Pentachloroethyl) ether; "Perchloroether")  C_4OCl_{10} Beil. II - 210 II_1— II_2—

M.P. 69° (1) $D_{-}^{14.5} = 1.900$ (2)

[For crystallog. data see (3).]

[For prepn. of C̄ from abs. diethyl ether (1:6110) with excess dry Cl_2 in direct sunlight see (1).]

C̄ on boilg. decomposes (2) into trichloroacetyl chloride (3:5420) and hexachloroethane (3:4835).

C̄ with conc. H_2SO_4 at 240° is slowly attacked yielding (2) trichloroacetyl chloride (3:5420).

C̄ with alc. K_2S loses 2 atoms of chlorine yielding (2) di-(trichlorovinyl) ether (3:6373).

C̄ with metallic potassium on htg. detonates; in this behavior C̄ behaves toward alkali metals like many other highly halogenated compounds.

Note that all these data on C̄ are very old; no later studies of C̄ are reported in the literature.

3:1676 (1) Regnault, *Ann.* **34**, 27–29 (1840). (2) Malaguti, *Ann. chim.* (3) **16**, 13–28 (1846). (3) Nickles, *Ann. chim.* (3) **22**, 29 (1848).

3:1685 CHLOROPROPIOLIC ACID Cl.C≡C.COOH C_3HO_2Cl Beil. II - 478 II_1— II_2-(451)

M.P. 69–70° (1)

Colorless cryst. from pet. eth.; eas. sol. ether; eas. vol. (even in desiccator). Very irritating and poisonous; salts extremely toxic (1). — Stable in dry state at room temperature.

[For prepn. from propiolic ac. [Beil. II-477] by actn. of KOH/KOCl soln. at 0° see (1) (2).]

C̄ on htg. with $Ba(OH)_2$ soln. yields chloroacetylene (3:7000) + $BaCO_3$ while acidification and ether extraction of the aq. layer yields malonic ac. (1:0480), m.p. 133–134° (1). [An alk. soln. of C̄ on stdg. is also partly converted to malonic ac. (1).]

3:1685 (1) Straus, Kollek, Heyn, *Ber.* **63**, 1876–1877 (1930). (2) Brit. 333,946, Sept. 18, 1930; *Cent.* **1931**, I 523.

3:1687 2,3,4,6-TETRACHLOROPHENOL  $C_6H_2OCl_4$ Beil. VI - 193 VI_1— VI_2-(182)

M.P.	**70°**	(1) (2) (3)	**B.P.**	**164°**	at 23 mm. (4)
	69–70°	(4)		**160.5°**	at 21 mm. (4)
	68–69°	(5) (6)		**159°**	at 20 mm. (4)

	67°	(10) (11)		**150°**	at 16 mm. (4)
	65.5°	(12)			
	65–66°	(13)			

Ndls. from lgr., AcOH, or ether. — Almost insol. cold aq.; spar. sol. hot aq.; but volatile with steam. — Eas. sol. alc., C_6H_6, $CHCl_3$, CS_2, lgr.; fairly sol. hot pet. eth. — Odorless at ord. temp.

PREPARATION OF $\bar{C}$

[For prepn. of $\bar{C}$ from phenol (1:1420) with Cl_2 at 80° for 14 days (7) or with Cl_2 in pres. of 2–3% I_2 or 4–5% $SbCl_3$ or 5–6% $FeCl_3$ for shorter periods (7), from sodium phenolate with SO_2Cl_2 (13), or from 2,4,6-trichlorophenol (3:1673) with Cl_2 (1) in pres. of I_2 at 40° (8) or with Cl_2 in CCl_4 soln. in pres. of $FeCl_3$ (14), see indic. refs.]

[For formn. of $\bar{C}$ from 3,5,6-trichloro-2-hydroxybenzoic acid (3,5,6-trichlorosalicylic acid) (5) with Cl_2 in 30% AcOH see (5); from 2,4,5,6-tetrachloro-3-hydroxybenzoic acid [Beil. X-144] (11) by htg. with lime see (11); from 2,4,5,6-tetrachloro-3-hydroxybenzaldehyde (6) with 50% aq. KOH at 100° for 2 hrs. (the CO group being eliminated as K formate) see (6); from *o*-(2,4,5,6-tetrachloro-3-hydroxybenzoyl)benzoic acid (3) by cleavage with conc. H_2SO_4 see (3).]

[For formn. of $\bar{C}$ from 1,2,4,4,5,6,6-heptachlorocyclohexen-1-one-3 [Beil. VII-51] by reduction with $SnCl_2/HCl/AcOH$ (4) or with KI/AcOH or Na_2SO_3/AcOH see (12); from "6-hydroxyphenylene diazosulfide" with Cl_2 in AcOH followed by reduction with $SnCl_2$ see (10).]

USES OF $\bar{C}$ (OR ITS SALTS)

[For patents on use of $\bar{C}$ (or its salts) as bactericide (15) (16) in preservation of rubber latex (17), as insecticide (18), or in triphenyl phosphate as wood preservative (19) see indic. refs.]

[For general articles on $\bar{C}$ (or its salts) as bactericides (20), fungicides (21) (27) for paint (22) or leather (23) (24) (25) (26), or in preservation of brine samples for analysis (28) see indic. refs.]

PHYSIOLOGICAL EFFECTS OF $\bar{C}$ (OR ITS SALTS)

[For studies on dermatitis from $\bar{C}$ or its salts see (29) (30); for report on toxicity of $\bar{C}$ in leather see (31).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Action of chlorine. [$\bar{C}$ with Cl_2 in AcOH gives (4) (12) 1,2,4,4,5,6,6-heptachlorocyclohexen-1-one-3 [Beil. VII-51].]

Action of bromine. $\bar{C}$ with Br_2 (1 mole) in pres. of Fe powder gives (8) 5-bromo-2,3,4,6-tetrachlorophenol [Beil. VI_1-(106)], cryst. from AcOH, m.p. 197° (8) (32), 192° (33) (corresp. acetyl deriv., m.p. 144° (33); corresp. benzoyl deriv., m.p. 169° (33)).

Action of nitric acid. [$\bar{C}$ with fumg. HNO_3 (5 wt. parts) is oxidized (70% yield (4)) (12) to 2,3,5-trichlorobenzoquinone-1,4 (3:4672). — Note, however, that the mononitro deriv. of $\bar{C}$, viz., 5-nitro-2,3,4,6-tetrachlorophenol, ndls. from C_6H_6, m.p. 122°, has been obtd. (8) by HBr cleavage of the corresp. methyl ether (see below).]

Behavior of $\bar{C}$ as an acid. $\bar{C}$ in aq. behaves as an acid, K at 25° = 4.2×10^{-6} (2) cf. (34), and can be titrated with $N/10$ aq. NaOH (1); Neut. Eq = 232. — [For prepn. of alk. salts of $\bar{C}$ by neutralization in mixtures of org. solvents see (35); for uses of salts of $\bar{C}$ see above.]

Miscellaneous reactions of $\bar{C}$. [$\bar{C}$ (as $K\bar{A}$) in conc. aq. soln. with $COCl_2$ (3:5000) in toluene gives (36) *bis*-(2,3,4,6-tetrachlorophenyl) carbonate, m.p. 155–156° (36).]

Ⓓ **2,3,4,6-Tetrachlorophenyl methyl ether** (2,3,4,6-tetrachloroanisole): ndls. from MeOH, m.p. 64–65° (4), 60° (8), b.p. 266–270° u.c. at 244 mm. (8). [From C̄ with MeI in MeOH/NaOMe soln. (4) cf. (8). — Note that this prod. on nitration with 7–8 wt. pts. fumg. HNO_3 gives 5-nitro-2,3,4,6-tetrachloroanisole, m.p. 58° (8).]

Ⓓ **2,3,4,6-Tetrachlorophenyl ethyl ether** (2,3,4,6-tetrachlorophenetole): ndls. from alc., m.p. 59–60° (4), 55° (6). [From C̄ with EtI in EtOH/NaOEt soln. (4); also indirectly (6).]

Ⓓ **2,3,4,6-Tetrachlorophenyl acetate**: cryst. from alc., m.p. 66° (5), 65–66° (4), 59° (12). [From C̄ with Ac_2O (4) or with AcCl (12).]

Ⓓ **2,3,4,6-Tetrachlorophenyl benzoate**: cryst. from alc., m.p. 116° (10) (13) (3), 115° (4), 114.5° (12), 113–115° (11). [From C̄ as NaĀ with BzCl (4). — Note that this prod. depresses m.p. (110°) of the corresp. benzoate from 2,3,4,5-tetrachlorophenol (3:3523) (9).]

Ⓓ **2,3,4,6-Tetrachlorophenyl *N*-phenylcarbamate**: ndls. from alc., m.p. 141–142° (4). [From C̄ with phenyl isocyanate in C_6H_6 24 hrs. at room temp. (4).]

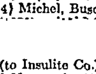
3:1690 2,6-DICHLOROBENZALDEHYDE $C_7H_4OCl_2$ Beil. VII - 237 VII_1-(134)



M.P. 71° (1)
70–71° (2)
70° (3)
69–70° (4) (5)

Colorless cryst. from pet. ether (b.p. 40–60°) or lgr.

[For prepn. of C̄ from 2,6-dichlorotoluene (3:6270) by oxidn. with $MnO_2 + H_2SO_4$ see (2); for prepn. of C̄ from 2,6-dichlorobenzaldehyde diethylacetal (see below) by hydrolysis on shaking with dil. HCl see (6).]

[C̄ on reduction would presumably yield 2,6-dichlorobenzyl alc., but this prod. is unreported in the literature.]

C̄ in alk. suspension on oxidn. with air gives (7) 2,6-dichlorobenzoic acid (3:4200), m.p. 144°.

[C̄ (fused) with Cl_2 in brilliant artificial light gives (58% yield (8)) 2,6-dichlorobenzoyl chloride, b.p. 126–128° at 18 mm. — C̄ with PCl_5 at 160° gives (90% yield (9)) (4) (5) 2,6-dichlorobenzal (di)chloride (3:9398) oil, b.p. 124–126° at 16 mm. (9), accompanied in some preparations (4) (5) by some *bis*-(α,2,6-trichlorobenzyl) ether, m.p. 180–185° (4) (5).]

[C̄ with alkali sulfite (1 mole) under press. reacts at one of the two halogen atoms giving (2) 6-chlorobenzaldehydesulfonic acid-2 [Beil. XI-324] — C̄ with alkali sulfite (2 moles) under press. gives (2) benzaldehyde disulfonic acid-2,6 [Beil. XI-326].]

C̄ disslvd. in 7–8 wt. pts. conc. H_2SO_4, and at 10–15° mononitrated with a mixt. of fumg. HNO_3 + conc. H_2SO_4, poured into aq. gives (yield not stated (10)) (2) 2,6-dichloro-3-nitrobenzaldehyde [Beil. VII-263], pl. from CS_2 (10) or lfts. from C_6H_6 (2), m.p. 76° (10), 76–77° (2) (corresp. α-oxime, m.p. 156–157° (10), β-oxime, m.p. 154–155° (10); note that a mixt. of the two oximes melts 128–130° (10)) — [Note that no dinitro-2,6-dichlorobenzaldehyde has been reported; also that the m.p.'s of certain of the isomeric mononitrodichlorobenzaldehydes are very close to the above mononitration prod.: e.g., 2,4-dichloro-6-nitrobenzaldehyde (from 2,4-dichlorobenzaldehyde 3:1800) has m.p. 74–75°; 2,5-dichloro-3-nitrobenzaldehyde (from 2,5-dichlorobenzaldehyde 3:1145) has m.p. 66.5–67°; 3,4-dichloro-6-nitrobenzaldehyde (from 3,4-dichlorobenzaldehyde 3:0550) has m.p. 73°.]

[C̄ on sulfonation gives (2) 2,6-dichlorobenzaldehydesulfonic acid-3 [Beil. XI-325].]

[C̄ with 50% KOH at 100° for 5 hrs. under N_2 undergoes cleavage of the aldehyde group giving (84% yield (11)) *m*-dichlorobenzene (3:5960) q.v. and the corresp. K formate.]

[C̄ with aq. alc. hydrazine sulfate gives (86% yield (18)) 2,6-dichlorobenzaldazine, m.p. 153° cor.; but this prod. or C̄ with hydrazine hydrate refluxed 5 hrs. gives 2,6-dichlorobenzaldehyde hydrazone, m.p. 134°, which by Wolff-Kishner reduction gives (80% yield (18)) 2,6-dichlorotoluene (3:6270).]

[C̄ with EtOH contg. 1½ wt. % dry HCl refluxed 24 hrs. gives (13.6% yield (6)) 2,6-dichlorobenzaldehyde diethylacetal, oil, b.p. 142–144° at 10 mm., m.p. −1° (6); this prod. with dil. HCl readily hydrolyzes back to C̄ + EtOH.]

[C̄ with β-naphthol (2 moles) in AcOH with 30% HBr in AcOH at 100° for 2 hrs. or at room temp. for 24 hrs. condenses and ring-closes giving (88% yield (8)) 9-(2,6-dichlorophenyl)-1,2,7,8-dibenzoxanthane ($C_{27}H_{16}OCl_2$), cryst. from lgr., m.p. 264–265° (8). — Note that C̄ with β-thionaphthol (2 moles) under similar conditions yields a prod. $C_{27}H_{18}S_2Cl_2$, of unknown structure.]

C̄ with anhydrous NaOAc + Ac_2O in Perkin synthesis (12) (13) (1), or C̄ with malonic acid in AcOH (13) gives (yields: 81–83% (12), 80% (1), 18% (13)) 2,6-dichlorocinnamic acid [Beil. IX$_1$-(239)], cryst. from AcOH, m.p. 196° (12), 193° (13), 183° (1); note that in this reaction some 2,6-dichlorobenzal diacetate [Beil. VII$_1$-(134)], ndls. from lgr., m.p. 85° (1), is sometimes formed.

C̄ appears to behave normally with RMgX reactants [e.g., C̄ with MeMgI in dry ether followed by usual hydrolysis gives (68.6% yield (14)) 2,6-dichlorophenyl-methyl-carbinol,

m.p. 34–35°, b.p. 137–138° at 17 mm., 134–136° at 13 mm. (corresp. benzoate, m.p. 77°); C̄ with C_6H_5MgBr similarly gives in good yield (1) 2,6-dichlorophenyl-phenyl-carbinol, m.p. 57° (corresp. acetate, m.p. 105°)]. [For conversion of C̄ to 2,6-dichlorostyrene (16) (17) via formn. of 2,6-dichlorophenyl-methyl-carbinol (above) and dehydration of latter with $KHSO_4$ (31.5% yield (16)) see indic. refs.]

C̄ with aniline readily condenses yielding (1) 2,6-dichlorobenzaldehyde anil, m.p. 64–65°.

Ⓓ **2,6-Dichlorobenzaldoxime:** colorless ndls. from C_6H_6 (10) or lgr. (1), m.p. 149–150° (10), 146–147° (1). [From C̄ with $NH_2OH.HCl$ + Na_2CO_3 in dil. alc. at 100° for 5 hrs. (10) cf. (1); with cold Ac_2O this prod. gives an acetyl deriv., m.p. 51° (10); with boilg. Ac_2O for 5 min. the oxime loses H_2O giving (1) 2,6-dichlorobenzonitrile [Beil. IX-343, IX_1-(141)], ndls. from lgr. or by sublimation, m.p. 143° (1), 144.5–146.5° (15).]

—— **2,6-Dichlorobenzaldehyde phenylhydrazone:** unreported.

—— **2,6-Dichlorobenzaldehyde *o*-nitrophenylhydrazone:** m.p. 154° (1).

—— **2,6-Dichlorobenzaldehyde *p*-nitrophenylhydrazone:** unreported.

—— **2,6-Dichlorobenzaldehyde 2,4-dinitrophenylhydrazone:** unreported.

—— **2,6-Dichlorobenzaldehyde *p*-bromophenylhydrazone:** m.p. 142° (1).

—— **2,6-Dichlorobenzaldehyde semicarbazone:** unreported.

	71°	(2)
	70–71°	(3)
	70°	(4) (11) (20) (27)
	68–69°	(5)
	68°	(8)

Ndls. from hot aq., ndls. from lgr., pr. from $CHCl_3$; eas. sol. alc., AcOH, C_6H_6, $CHCl_3$, boilg. lgr. — For crystallographic constants see (4). — Volatile with steam.

[For prepn. of C̄ from β-naphthol (1:1540) with Cl_2 in AcOH (80% yield (21)) (3) (4) (6), with SO_2Cl_2 in CS_2 (7) or with $C_6H_5ICl_2$ (84% yield (2)) see indic. refs.; from sodium β-naphtholate in CS_2 suspension on treatment with Cl_2 (8) or in cold aq. with NaOCl (84% yield (5)) (9) see indic. refs.; for formn. of C̄ from β-naphthol (1:1540) as by-prod. of its

oxidn. with $FeCl_3$ to β-dinaphthol (2,2'-dihydroxybinaphthyl-1,1') see (10) (11) (the proportion of C̄ increases with increasing acidity (11)); for formn. of C̄ from β-naphthol as by-prod. of react. with $SeOCl_2$ see (20)]

C̄ with 1 mole Cl_2 in AcOH soln. gives (12) 1,6-dichloronaphthol-2 (3:3600), m.p. 119.5° (12); C̄ with 1 mole Br_2 yields (7) (13) 6-bromo-2-chloronaphthol-2 [Beil. VI-651], ndls. from AcOH with 1 mole solvent, m.p. 92°, anhydrous ndls. by sublimation, m.p. 101° (7). [Note, however, that *C̄ in AcOH + NaOAc with 1 mole Br_2 yields (1)* "1-bromo-1-chloro-2-oxonaphthalenedihydride-1,2," pale yel. pr. from lgr., m.p. 90° when pure but on short stdg. soon becoming lower]

[C̄ in AcOH with conc. HI ($D = 1.5$) boiled 5 hrs gives (79% yield (5)) β-naphthol (1:1540), m.p. 121° (5); note, however, that C̄ is unaffected by $SnCl_2$ either in acid or alk. even after protracted refluxing, but in AcOH/HCl in s.t. 8 hrs. at 100° (1) reduces to β-naphthol]

[C̄ in alk. soln. treated with *p*-nitrobenzenediazonium chloride soln loses its halogen atom and yields (14) (15) (16) cf. (21) 1-(*p*-nitrobenzeneazo)naphthol-2 ("Para Red") [Beil. XVI-165, XVI_1-(255)], red ndls from pyridine, m.p. 246–247° u.c. (14), from AcOH, m.p. 250° cor. (15). (Note, however, that as much as 40% of a light yel. by-prod., m.p. 125° dec., is also formed (16))]

[C̄ melted with PCl_5 and then treated with aq. (4), or C̄ in alk. soln shaken with $POCl_3$ (17), or sodium salt of C̄ shaken in xylene with $POCl_3$ (18), yields *tris*-(1-chloronaphthyl-2) phosphate, ndls from alc., m.p. 152° (4) (note that by the second method (above) *bis*-(1-chloronaphthyl-2)phosphoric acid, ndls. from alc. + HCl, m.p. 251° (4), is also formed (4)).]

[C̄ (2 moles) with Na_2S (1 mole) htd. in aq. under N_2 gives (97.5% yield (19)) *bis*-(2-hydroxynaphthyl-1) sulfide [Beil. VI-976, VI_1-(470)], colorless cryst. from AcOH, m.p. 226° cor. (19).]

C̄ under many circumstances yields ethers with difficulty and small yields; e.g., C̄ with MeOH + conc. H_2SO_4 (25) or *p*-toluenesulfonic acid (26) gives only 2–7% methyl ether; however, C̄ in MeOH/KOH htd. with MeI in s.t. at 100° for 5 hrs. (25), or C̄ in 15% KOH shaken with Me_2SO_4 for ½ hr. (91% yield (5)), gives 1-chloro-2-methoxynaphthalene, pr. from alc., m.p. 70–71° (5), 68° (25), 78° (27); this methyl ether on protracted htg. with conc. HCl in s.t. at 200–250° yields C̄ + MeCl (17) (27). — C̄ with EtOH + conc. H_2SO_4 (25) gives only 0.5–10% ethyl ether, but C̄ with EtOH/KOH + EtBr htd. 3 hrs. at 100° (25) gives 1-chloro-2-ethoxynaphthalene, lfts. from alc., m.p. 58° (25).

Ⓓ **1-Chloro-2-naphthyl acetate:** tbls. from alc., m.p. 42–43° (3). [From C̄ with AcCl (3).]

Ⓓ **1-Chloro-2-naphthyl benzoate:** lfts. from alc., m.p. 101° (27). [From C̄ in alk. soln by shaking with BzCl (27)]

	70–71°	(3)
	70°	(4) (11) (20) (27)
	68–69°	(5)
	68°	(8)

Ndls. from hot aq., ndls. from lgr., pr. from $CHCl_3$; eas. sol. alc., AcOH, C_6H_6, $CHCl_3$, boilg. lgr. — For crystallographic constants see (4). — Volatile with steam.

[For prepn. of C̄ from β-naphthol (1:1540) with Cl_2 i[illegible] with SO_2Cl_2 in CS_2 (7) or with $C_6H_5ICl_2$ (84% yield [illegible] naphtholate in CS_2 suspension on treatment with Cl_2 [illegible] yield (5)) (9) see indic. refs.; for formn. of C̄ from β-naphthol (1:1540) as by-prod. of its

oxidn. with $FeCl_3$ to β-dinaphthol (2,2′-dihydroxybinaphthyl-1,1′) see (10) (11) (the proportion of C̄ increases with increasing acidity (11)); for formn. of C̄ from β-naphthol as by-prod. of react. with $SeOCl_2$ see (20).]

C̄ with 1 mole Cl_2 in AcOH soln. gives (12) 1,6-dichloronaphthol-2 (3:3600), m.p. 119.5° (12); C̄ with 1 mole Br_2 yields (7) (13) 6-bromo-2-chloronaphthol-2 [Beil. VI-651], ndls. from AcOH with 1 mole solvent, m.p. 92°, anhydrous ndls. by sublimation, m.p. 101° (7). [Note, however, that C̄ in AcOH + NaOAc with 1 mole Br_2 yields (1) "1-bromo-1-chloro-2-oxonaphthalenedihydride-1,2," pale yel. pr. from lgr., m.p. 90° when pure but on short stdg. soon becoming lower.]

[C̄ in AcOH with conc. HI ($D = 1.5$) boiled 5 hrs. gives (79% yield (5)) β-naphthol (1:1540), m.p. 121° (5); note, however, that C̄ is unaffected by $SnCl_2$ either in acid or alk. even after protracted refluxing, but in AcOH/HCl in s.t. 8 hrs. at 100° (1) reduces to β-naphthol.]

[C̄ in alk. soln. treated with p-nitrobenzenediazonium chloride soln. loses its halogen atom and yields (14) (15) (16) cf. (21) 1-(p-nitrobenzeneazo)naphthol-2 ("Para Red") [Beil. XVI-165, XVI_1-(255)], red ndls. from pyridine, m.p. 246–247° u.c. (14), from AcOH, m.p. 250° cor. (15) (Note, however, that as much as 40% of a light yel. by-prod., m.p. 125° dec., is also formed (16).)]

[C̄ melted with PCl_5 and then treated with aq. (4), or C̄ in alk. soln. shaken with $POCl_3$ (17), or sodium salt of C̄ shaken in xylene with $POCl_3$ (18), yields *tris*-(1-chloronaphthyl-2) phosphate, ndls. from alc., m.p. 152° (4) (note that by the second method (above) *bis*-(1-chloronaphthyl-2)phosphoric acid, ndls. from alc. + HCl, m.p. 251° (4), is also formed (4)).]

[C̄ (2 moles) with Na_2S (1 mole) htd. in aq. under N_2 gives (97.5% yield (19)) *bis*-(2-hydroxynaphthyl-1) sulfide [Beil. VI-976, VI_1-(470)], colorless cryst. from AcOH, m.p. 226° cor. (19).]

[C̄ on refluxing a few hrs. with aniline (best under N_2 (23)) yields (22) 1-anilinonaphthol-2 [Beil. XIII-678], ndls. from lgr., m.p. 153–154° (22), 155–156° (23); for corresp. reactn. with many other monamines (22) (23) and diamines (24) see indic. refs.]

C̄ under many circumstances yields ethers with difficulty and small yields; e.g., C̄ with MeOH + conc. H_2SO_4 (25) or p-toluenesulfonic acid (26) gives only 2–7% methyl ether; however, C̄ in MeOH/KOH htd. with MeI in s.t. at 100° for 5 hrs. (25), or C̄ in 15% KOH shaken with Me_2SO_4 for ½ hr. (91% yield (5)), gives 1-chloro-2-methoxynaphthalene, pr. from alc., m.p. 70–71° (5), 68° (25), 78° (27); this methyl ether on protracted htg. with conc. HCl in s.t. at 200–250° yields C̄ + MeCl (17) (27). — C̄ with EtOH + conc. H_2SO_4 (25) gives only 0.5–10% ethyl ether, but C̄ with EtOH/KOH + EtBr htd. 3 hrs. at 100° (25) gives 1-chloro-2-ethoxynaphthalene, lfts. from alc., m.p. 58° (25).

Ⓓ **1-Chloro-2-naphthyl acetate**: tbls. from alc., m.p. 42–43° (3). [From C̄ with AcCl (3).]

Ⓓ **1-Chloro-2-naphthyl benzoate**: lfts. from alc., m.p. 101° (27). [From C̄ in alk. soln. by shaking with BzCl (27).]

3:1757 6-CHLORO-2-PHENYLPHENOL $C_{12}H_9OCl$ **Beil. S.N. 539**

(3-Chloro-2-hydroxybiphenyl; "o-chloro-o′-phenylphenol")

M.P.	**73–74°** (1)	**B.P. 312°**	at 745 mm.	(4)
	72° (4)	**172°**	at 15 mm.	(4)
	71–72° (3) (6)	**137–138°**	at 5 mm.	(6)
		138–140°	at 3 mm.	(10)

[*See also 4-chloro-2-phenylphenol* (3:8980).]

Important Note. Through the year 1944 (and perhaps in some cases beyond) the chlorophenylphenol of m.p. 72° (C̄) has been regarded as having the structure 4-chloro-2-phenylphenol = 5-chloro-2-hydroxybiphenyl = "p-chloro-o-phenylphenol." In 1945, however, this view was corrected by the paper of Weissberger and Salminen (1); in this text, therefore, expression of the facts is reported in the light of their paper. Particular care is, therefore, required in consulting reference prior to it since such material is universally expressed in the reverse sense of the present view.

[For prepn. of C̄ from 2-hydroxybiphenyl (1:1440) with Cl_2 (note that 4-chloro-2-phenylphenol (3:8980) is also formed) see (2) (4); for prepn. of C̄ from 3-amino-2-hydroxybiphenyl (5) by diazotization and use of Cu_2Cl_2 reaction (45% yield (1)) see indic. refs]

C̄ is sol. in aq 25% NaOH at 60°, but resultant salt is more sol than corresp. prod. from the isomeric 4-chloro-2-phenylphenol (3:8980) (for use in sepn of C̄ from the latter see (4)); note that sodium salt of C̄ cryst. as trihydrate, i.e., NaĀ.3H_2O (4), and that anhydrous NaĀ dec. at 316° without melting (4).

The calcium salt of C̄ is very spar. sol. aq. (use in sepn. of C̄ from the isomeric 4-chloro-2-phenylphenol (3)).

[For reaction of $\bar{C}$ with methallyl chloride (3:7145) in pres. of alk. see (10).]

$\bar{C}$ on mononitration with HNO_3 in AcOH at 15–19° as directed gives (31% *yield* (1)) 3-chloro-2-hydroxy-5-nitrobiphenyl, tan needles, m.p. 130–131° (1), 129–131° (6).

[$\bar{C}$ (?) on condensation with formaldehyde + ethanolamine as directed (9) *gives a prod.*, m.p. 182–183°; for similar condens. of $\bar{C}$ (?) with formaldehyde + *morpholine* see (7).]

—— 6-Chloro-2-phenylphenyl benzoate: m.p. 88.5° (8). [Note that this prod. does *not* distinguish $\bar{C}$ from the isomeric 4-chloro-2-phenylphenol (3:8980), whose benzoate has m.p. 86–87°.]

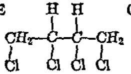
3:1760 1,2,3,4-TETRACHLOROBUTANE (solid isomer) (Butadiene tetrachloride; erythrene tetrachloride)



$C_4H_6Cl_4$ Beil. I - 119 I_1-(38) I_2—

M.P. 73–74° (1) (2); 72.5–73° (3); 72° (4); 70° (5)

B.P. 130–134° at 40 mm. (4)

This compd. is known in two diastereoisomeric forms, one solid ($\bar{C}$), and one liquid (3:9082) q.v.

$\bar{C}$ cryst. from alc. (1) or CCl_4 (3) in colorless pr. with strong camphoraceous odor.

[For preparation of $\bar{C}$ from butadiene-1,3 by treatment in cold with Cl_2 (4) (6) (7) in CS_2, CCl_4, $CHCl_3$, or lgr. soln. (4), or with SCl_2 in pet. ether (1) see indic. refs.; for prepn. from 1,2,3,4-tetrahydroxybutane (erythritol) (1:5825) with PCl_5 in CS_2 see (3); for formn. from acetylene + HCl in electric discharge see (2).] [The proportion of solid ($\bar{C}$) and liq. (3:9082) isomers formed varies with conditions.]

$\bar{C}$ on warming with Zn dust in alc. yields (4) butadiene-1,3, b.p. −4.8°.

$\bar{C}$ with MeOH/KOH at 10–18° loses 2 HCl yielding (8) 2,3-dichlorobutadiene-1,3 (3:5220), b.p. 39–40° at 80 mm., and other products.

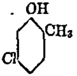
3:1815 5-CHLORO-2-METHYLPHENOL (5-Chloro-o-cresol)



C_7H_7OCl Beil. VI — VI_1-(174) VI_2-(332)

M.P. 73–74° (1) (4)

Long white hard ndls. from pet. eth.; eas. sol. alc., AcOH; less sol. pet. eth. (1).

C̄ is eas. sol. alk. (1).

[For prepn. from 5-chloro-2-methylaniline [Beil. XII-835] see (1) (4).]

C̄ on mononitration (2) in AcOH with fumg. HNO_3 at 5° gives mixt. of two mononitration products: 6-nitro-5-chloro-2-methylphenol, volatile with steam, golden-yel. pr. from pet. eth., m.p. 54.5–55° (2), and 4-nitro-5-chloro-2-methylphenol, not volatile with steam, cryst. from aq. or C_6H_6, m.p. 144–145° (2).

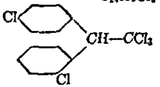
C̄ on nitration (3) with 3 pts. HNO_3 ($D = 1.48$) at 0° gives a dinitro compd., 4,6-dinitro-*5-chloro-2-methylphenol [Beil. VI_1-(181)]*, yel. ndls., from pet. eth., m.p. 146° (3); acetyl deriv., m.p. 109–110° (3).

[For action of HNO_2 on C̄ see (4).]

Ⓓ 5-Chloro-2-methylphenyl benzoate: from C̄ + BzCl + aq. alk., white lfts. from alc., m.p. 53–54° (1).

3:1815 (1) Zincke, *Ann.* **417**, 207–208 (1918). (2) von Auwers, Schornstein, *Cent.* **1924**, II 2269. (3) Zincke, *Ann.* **418**, 234 (1918). (4) Hodgson, Moore, *J. Chem. Soc.* **1926**, 2037.

3:1820 1,1,1-TRICHLORO-2-(o-CHLOROPHENYL)-2-(p-CHLOROPHENYL)ETHANE ("o,p′-DDT")



$C_{14}H_9Cl_5$ Beil. S.N. 479

M.P. 74.0–74.5° (4) cor. (6)
73–74° (5)

This compound is the so-called *o,p*-isomer of "DDT" (3:3298). Although known to be a substantial contaminant (e.g., 18% (1) –19% (5)) of technical "DDT," very little information is at present available regarding it.

Cryst. from MeOH.

[For prepn. of C̄ from 2,2,2-trichloro-1-(o-chlorophenyl)ethanol (5) with chlorobenzene (3:7903) in pres. of conc. H_2SO_4 at 60° (64% yield) see (5).]

C̄ on dinitration with fumg. HNO_3 at 50° for 1 hr. gives (5) a dinitro deriv., cryst. from 95% alc., m.p. 148.0–148.5° cor. (5); note that this prod. has same m.p. as corresp. deriv. from "DDT" but that m.p. of a mixt. of the two dinitro compds. is depressed.

C̄ on tetranitration with a mixt. (1:1 by volume) of fumg. HNO_3 + conc. H_2SO_4 at 100° for 1 hr. gives (2) a prod., m.p. 229.5–230° cor.; note that the corresp. prod. from "DDT" has m.p. 223.5–224.5° cor. (2).

C̄ with anhydrous $AlCl_3$ (1 mole) + large excess C_6H_6 at ord. temp. evolves HCl and gives (10% yield (3)) 1,1,2,2-tetraphenylethane, m.p. 211°; *in this connection see corresp.* behavior of "DDT" (3:3298).

C̄ with alc. KOH loses 1 HCl giving (97% yield (5)) (7) 1,1-dichloro-2-(o-chlorophenyl)-2-*(p-chlorophenyl)ethylene (3:1025), accompanied* by a little *o,p′*-dichlorodiphenylacetic acid, m.p. 106–107.5° cor. (7), the proportion of which may be increased by reaction of C̄ with $Ba(OH)_2$ in ethylene glycol at 175° (7).

3:1831 α,α,γ-TRICHLORO-*n*-BUTYRIC ACID $C_4H_5O_2Cl_3$ Beil. II-281
II_1—
II_2—

Cl
$CH_2.CH_2.C.COOH$
Cl Cl

M.P. 73–75° (1)

Cryst. with sharp odor suggesting chloroacetic acid. — Sol. in 20 pts. aq. — $\bar{C}$ blisters skin. — $\bar{C}$ in small amts. (5 g.) can (with care) be distilled, but attempts to distil larger units lead to decomposition with loss of HCl (2).

[For prepn. of $\bar{C}$ from α,α,γ-trichloro-*n*-butyraldehyde (3:9094) by odixn. with fumg. HNO_3 in cold see (1).]

$\bar{C}$ does not react with Zn dust in aq. or with aq. KI even at 100° (2); $\bar{C}$ does not react with NH_2OH (2).

$\bar{C}$ on boilg. with aq. (100 pts.) for 4 days yields (2) a soln. which is strongly acid, reduces Fehling soln. and hot $NH_4OH/AgNO_3$, and presumably conts. $HOCH_2$ $CH_2.CO.COOH$.

$\bar{C}$ with aq. Na_2CO_3 loses one of its three chlorine atoms (probably that in γ position) and upon acidification gives a soln. presumably contg. a lactone; for details see (2).

The acid chloride corresp. to $\bar{C}$ is unreported.

—— Methyl α,α,γ-trichloro-*n*-butyrate: unreported.
—— Ethyl α,α,γ-trichloro-*n*-butyrate: unreported.
—— α,α,γ-Trichloro-*n*-butyramide: unreported.
—— α,α,γ-Trichloro-*n*-butyranilide: unreported.
—— α,α,γ-Trichloro-*n*-butyr-α-naphthalide: unreported.

3:1831 (1) Natterer, *Monatsh.* **4**, 551–553 (1883). (2) Natterer, *Monatsh.* **5**, 258–265 (1884).

3:1840 α,β,β-TRICHLOROACRYLIC ACID

$$Cl_2C{=}C(Cl){-}COOH$$

$C_3HO_2Cl_3$ Beil. II - 402, II_1-(187), II_2-(388)

M.P. 76° (1) (2) (13)
74–75° (3)
73° (4)
72.9° (5)

B.P. 221–223° at 760 mm. (5)
133° cor. at 30 mm. (5)

Pr. from CS_2 or dry ether. — $\bar{C}$ is very eas. sol. hot aq. but spar. sol. cold aq.; at 25° its satd. aq. soln. conts. 6.4% $\bar{C}$ (1), at 20° 6% $\bar{C}$ (2). — $\bar{C}$ with aq. within certain limits forms two liq. layers; for thermal anal. of the system see (5); note that $\bar{C}$ with aq. forms a compd. of compn. $\bar{C}$ + 2.5 H_2O, m.p. −0.6°, and that $\bar{C}$ with this compound forms a eutectic, m.p. 17° (5). — $\bar{C}$ is very sol. in alc., ether, or $CHCl_3$.

[$\bar{C}$ is usually prepd. from hexachloropropylene (3:6370) by direct or indirect hydrolysis of its terminal —CCl_3 group to —COOH; for prepn. of $\bar{C}$ from hexachloropropylene by such hydrolysis with 90% H_2SO_4 in pres. of $Al_2(SO_4)_3$ at not above 130° (5) (1) cf. (6) (7) (81% yield (13)) or with boilg. aq. susp. of $BaCO_3$ (isolated as $Ba\bar{A}_2$ in 92% yield (1)) see indic. refs.; for prepn. of $\bar{C}$ from hexachloropropylene (3:6370) via conversion with alc. NaOEt to triethyl orthotrichloroacrylate and subsequent quantitative hydrolysis with alc. KOH see (4).]

[For formn. of $\bar{C}$ from hexachlorocyclopentanedione-1,3 [Beil. VII-553] by hydrolytic cleavage with 10% NaOH (3), or from β-bromo-α,β,β-trichloropropionic acid (see below) by elimination of HBr on stdg. several days with aq. $Ba(OH)_2$ (2), see indic. refs.]

$\bar{C}$ on reduction with H_2 in pres. of Pd cat. at ord. temp. and press. absorbs 4 moles H_2 yielding (8) propionic acid (1:1025).

$\bar{C}$ with Cl_2 in CCl_4 soln. in sunlight adds 1 mole halogen giving (9) (8) pentachloropropionic acid (3:4895).

[$\bar{C}$ with HBr might be expected to yield β-bromo-α,β,β-trichloropropionic acid, but this reaction is unreported although the expected prod. [Beil. II-257], m.p. 83–84° has been prepd. by other means and with $Ba(OH)_2$ loses HBr giving $\bar{C}$ (2).]

$\bar{C}$ with half its wt. of PCl_5 at 80° loses H_2O between two molecules giving (4) trichloroacrylic acid anhydride, cryst., insol. aq., m.p. 39–40° (4) (5); this product is also formed during the distillation of $\bar{C}$ even at reduced press. (5).

$\bar{C}$ with excess $SOCl_2$, however, gives (80–90% yield (1)) (13) trichloroacryloyl chloride (3:5845) q.v.

Salts of $\bar{C}$. [$Na\bar{A}$ (conductivity of aq. solns.) (10); $K\bar{A}$, spar. sol. cold aq. (2); $Ag\bar{A}$, spar. sol. cold aq. but recryst. from hot aq. without decompn. (2) (4); $Mg\bar{A}_2.3\frac{1}{2}H_2O$, sol. aq. (10); $Ca\bar{A}_2.3\frac{1}{2}H_2O$, sol. aq. (10) (2); $Sr\bar{A}_2$ $5H_2O$, sol. aq. (10); $Ba\bar{A}_2.3\frac{1}{2}H_2O$, sol. aq. (10) (2) (note that this salt on htg. in atm. of H_2 gives (11) dichloroacetylene (3:5010)); $Zn\bar{A}_2.6H_2O$ and $Zn\bar{A}_2.3\frac{1}{2}H_2O$ (10); $Cd\bar{A}_2.2H_2O$ (10); $Hg\bar{A}_2$ (no crystal aq.) (10).]

—— Methyl α,β,β-trichloroacrylate: unreported.

—— *Ethyl α,β,β-trichloroacrylate: b.p. 192–194°; 112–114° at 50 mm.;* D_4^{20} = 1.2183; n_D^{20} = 1.4649 (4). [Prepd. indirectly from triethyl orthotrichloroacrylate (itself obtd. from hexachloropropylene with NaOEt) by shaking with conc. HCl (4).]

Ⓓ α,β,β-Trichloroacrylamide: m.p. 97° (12), 96–97° (4), 96° (2). [From trichloroacryloyl chloride (3:5845) with conc. NH_4OH (4) or from ethyl trichloroacrylate (above) with alc. NH_3 (12)]

Ⓓ α,β,β-Trichloroacrylanilide: m.p. 98° (13). [From trichloroacryloyl chloride (3:5845) with aniline in $CHCl_3$ at 0° (77% yield) (13).]

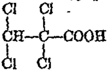
3:1850 α,α,β,β-TETRACHLOROPROPIONIC ACID

$C_3H_2O_2Cl_4$ Beil. II-253, II₁—, II₂—



M.P. 76° (1)

Colorless cryst. from $CS_2 + CHCl_3$; fairly *sol.* aq.

[For prepn. of C̄ from α,β-dichloroacrylic acid (3:2265) in CS_2 with dry Cl_2 in sunlight see (1).]

Salts: KĀ; AgĀ (readily dec. to AgCl on warming aq. soln.); $Ca\bar{A}_2$; $Ba\bar{A}_2$ (1).

3:1850 (1) Maberry, Smith, *Ber.* **22**, 2659–2660 (1889).

3:1875 β,β-DICHLOROACRYLIC ACID

$C_3H_2O_2Cl_2$ Beil. II-401, II₁—, II₂—

$Cl_2C{=}CH.COOH$

M.P. 76–77° (1) (2) (3)
(*Also see text.*)

Ndls. from pet. ether or by sublimation. — C̄ is spar. sol. aq. but *very eas. sol. ether* or $CHCl_3$. — C̄ on htg. above its m.p. (e.g., to 120°), then rapidly cooled to 60° or below remelts at 63–64° (2) (3); on standing, however, C̄ finally reverts to the form of m.p. 76–77°. — C̄ decomposes on attempted distn.

[For prepn. of C̄ from propiolic acid (acetylene-carboxylic acid) [Beil. II-477] by conversion to chloropropiolic acid (3:1685) and subsequent addn. of 1 HCl by htg. with a large excess conc. HCl at 100° for 5 hrs. (77% overall yield from propiolic acid) see (1); for formn. from "chloralide" (3:3510) by reduction with Zn + HCl in alc. soln. see (2) (3).]

The behavior of C̄ toward hydrogenation has not been reported.

Neither C̄ *nor* its ethyl ester (see below) [illegible]

[C̄ with [illegible]

the formn. [illegible]

tion somet. [illegible]

Salts: KĀ [illegible] $2H_2O$ (2); $Ba\bar{A}_2.2H_2O$ (2); $Zn\bar{A}_2.2H_2O$ (3).

C̄ with PCl_5 gives (3) β,β-dichloroacryloyl chloride, b.p. above 145°; this prod. with EtOH or C̄ in EtOH with dry HCl gives (3) ethyl β,β-dichloroacrylate, b.p. 173–175°.

—— β,β-Dichloroacrylamide: ndls. from $CHCl_3$, m.p. 112–113° (3). [From the above acid chloride with dry NH_3 (3).]

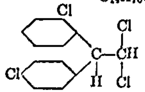
3:1890 1,1-DICHLORO-2-(*o*-CHLOROPHENYL)-2-(*p*-CHLOROPHENYL)ETHANE ("*o,p*-DDD")

$C_{14}H_{10}Cl_4$ Beil. S.N. 474



M.P. 76–78° (1)

Colorless cryst. from MeOH or from pentane. — Note that Č is a minor impurity in technical grade "DDT" (3:3298).

[For prepn. of Č from 2,2-dichloro-1-(*o*-chlorophenyl)ethanol (1) with chlorobenzene (3:7903) in pres. of H_2SO_4 (39% yield) see (1).]

Č with alc. KOH loses 1 HCl giving (1) 1-chloro-2-(*o*-chlorophenyl)-2-(*p*-chlorophenyl)-ethylene (not described) which upon oxidn. with CrO_3/AcOH gives (1) 2,4-dichlorobenzophenone (3:1565).

3:1890 (1) Haller, Bartlett, Drake, Newman, Cristol, et al., *J. Am. Chem. Soc.* **67**, 1600 (1945).

3:1900 2-CHLORO-4-PHENYLPHENOL (3-Chloro-4-hydroxybiphenyl)

$C_{12}H_9OCl$ Beil. S.N. *539*

M.P. 77° (1) (4) B.P. 176.6° at 5 mm. (5)

Č is sol. in NaOH. [For prepn. of NaĀ using solns. of Č in org. solv. such as MeOH, ether, or toluene see (2).]

Č htd. with NaOH/Na_2CO_3 soln. under press. for 3 hrs. at 290–300° gives 4-phenylpyrocatechol [Beil. VI-990], m.p. 145°; diacetate, m.p. 77.5–78° (3).

Č in CCl_4 stood 5 days with 1 mole Br_2 gave (44% yield) 6-bromo-2-chloro-4-phenylphenol, wh. pr. (from $CHCl_3$), m.p. 84–86° cor. (4); Č in AcOH (25% yield) or in CS_2 (56% yield) stood 2 days with 2 moles Br_2 gave 6-bromo-4′-(*p*-bromophenyl)-2-chlorophenol, coarse wh. ndls., m.p. 143–146° cor. (4).

Č in AcOH treated with 1 mole HNO_3 in AcOH gave 38% yield of 2-chloro-6-nitro-4-*phenylphenol, thick yel. pl. (from CCl_4), m.p. 89–90° cor. (5).*

Č with $(CH_3)_2SO_4$ + NaOH (1) or CH_3I + aq. KOH (5) yields the corresp. Me ether, 2-chloro-4-phenylanisole, m.p. 91–92° (1), 93° cor. (5).

- Ⓓ **2-Chloro-4-phenyl-phenyl acetate:** *m.p. 68° (7).* [From Č + Ac_2O + NaOAc in 92% yield (7).]
- Ⓓ **2-Chloro-4-phenyl-phenyl benzoate:** from Č + BzCl + aq. alk. in 80% yield (4); cryst. from AcOH (4), m.p. 95–97° cor. (4), 110–111° (6).
- Ⓓ **2-Chloro-4-phenyl-phenyl benzenesulfonate:** m.p. *59–60° (8). [From Č + benzenesulfonyl chloride* + aq. 10% NaOH (8).]
- Ⓓ **2-Chloro-4-phenyl 2,4-dinitrophenyl ether:** from Č + 2,4-dinitrochlorobenzene in conc. aq. KOH refluxed for several hrs.; yield, 70%; m.p. 109–111°C. (4).

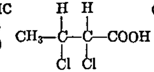
3:1903 **α,β-DICHLORO-n-BUTYRIC ACID (high-melting isomer)** (Isocrotonic acid dichloride)



$C_4H_6O_2Cl_2$ Beil. II-279, II_1—, II_2—

M.P. 78° (1) (2) (5) **B.P. 131.5°** at 20 mm. (2)
72–73° (3) (4) **130–131°** at 18 mm. (5)

[*See also α,β-dichloro-n-butyric acid (low-melting isomer) (crotonic acid dichloride)* (3:1375).]

Colorless cryst. from pet. ether. — $\bar{C}$ is very eas. sol. alc., ether, much less sol. aq.

[For prepn. of $\bar{C}$ from α-chlorocrotonic acid (3:2760) by addn. of 1 HCl using conc. aq. HCl (satd. at 0°) in s.t. at 100° for 50 hrs. see (2) (4); from either α-chloro-β-hydroxy-n-butyric acid of m p. 62° [Beil. III-309] (4) or from β-chloro-α-hydroxy-n-butyric acid of m p. 125° [Beil. III-306] (3) by htg with conc. aq. HCl (satd. at 0°) in s.t at 100° for 40 hrs. see indic. refs.; for formn. of $\bar{C}$ by (partial) isomerization of the lower-melting isomer (crotonic acid dichloride) (3:1375) with conc HCl in s t. at 100° see (5); from the amide (see below) corresp. to $\bar{C}$ with HNO_2 see (1).]

$\bar{C}$ behaves as an acid but is slightly weaker than its isomer; ionization const. of $\bar{C}$ is $6\,1 \times 10^{-3}$ (5); its reported salts include $Ag\bar{A}$, spar sol. aq. (4), $Ba\bar{A}_2.3H_2O$ (4): and $Zn\bar{A}_2$ (4).

$\bar{C}$ with alc. KOH loses 1 mole HCl giving (2) (4) mainly α-chlorocrotonic acid (3:2760) accompanied by some α-chloro-isocrotonic acid (3:1615).

The acid chloride corresp. to $\bar{C}$ is unreported.

—— **Methyl α,β-dichloro-n-butyrate:** unreported.
—— **Ethyl α,α-dichloro-n-butyrate:** unreported.
—— **α,β-Dichloro-n-butyramide:** m.p. 125° (1). [Prepd. indirectly but with HNO_2 gives $\bar{C}$ (1).]

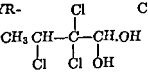
3:1905 **α,α,β-TRICHLORO-n-BUTYRALDEHYDE HYDRATE** ("Butyrchloral hydrate")



$C_4H_7O_2Cl_3$ Beil. I-664, I_1—, I_2-(725)

M.P. 78° (1)
77–78° (2)
77° (24)
74–74.5° (3)

[*See also α,α,β-trichloro-n-butyraldehyde (butyrchloral)* (3:5910).]

Lfts. from aq. or alc. — Spar. sol. cold but fairly eas. sol. hot aq.; very eas sol. alc. — For crystallographic data see (3) (5). — Note that because of tendency to dissociate on htg. into butyrchloral (3:5910) + aq. the m.p. observed for $\bar{C}$ varies according to rate of htg (3). — Note also that $\bar{C}$ is isomeric with chloral ethylalcoholate (3:0860) with which it must not be confused; for distinction of $\bar{C}$ from chloral hydrate (3:1270) see (9) (10).

$\bar{C}$ is employed in medicine as a sedative; from the body it is excreted in the urine as urobutyrochloralic acid [Beil. I-664], which upon hydrolysis yields (4) 2,2,3-trichlorobutanol-1 (3:1330) + glucuronic acid [Beil. III-884, III_1-(306)].

[For prepn. of $\bar{C}$ from butyrchloral (3:5910) by reactn. with aq. see (1) (2) (6).]

[$\bar{C}$ is reduced by fermenting yeast giving (7) dextrorotatory 2,2,3-trichlorobutanol-1, m.p. 62°; for actn. of $\bar{C}$ on alc. fermentation see (8).]

$\bar{C}$ on oxidn. with 3 wt. pts. fumg. HNO_3 (D = 1.504) at 30–35° for 1½ hrs. then stood at room temp. for 24 hrs. gives (95% yield (11)) α,α,β-trichloro-n-butyric acid (3:1280).

$\bar{C}$ on distn. with half its wt. of Ac_2O (12), or shaking with conc. H_2SO_4 (13), or on distn. with $CHCl_3$ (14), *or on htg. alone loses its combined aq. yielding butyrchloral* (3:5910), b.p. 165°.

$\bar{C}$ with conc. H_2SO_4 (at least 6 wt. pts.) at room temp. for 2 days trimerizes to a mixt. (80% yield (12)) of two parabutyrchlorals: these are colorless crystn., sharp-melting solids, sol. in org. solvents, but insol. aq.; the less sol. α-parabutyrchloral, rhombic cryst. from boilg. AcOH or boilg. EtOH, has m.p. 180°; the more sol. β-parabutyrchloral (stereoisomer ?), cryst. from boilg. AcOH or boilg. EtOH, has m.p. 157°; these polymers can be distilled at 15 mm. but attempts to distil them at ord. press. result in complete dissociation to butyrchloral (3:5910).

$\bar{C}$ *with aq. KOH or NaOH evolves heat and yields* (1) (15) *1,1-dichloropropene-1* (3:5120) + the salt of formic acid (1:1005).

[$\bar{C}$ with conc. aq. HCN fails (16) to react, but upon addn. of alc. and subsequent digestion (16), or $\bar{C}$ (1 mole) with aq. KCN (2 moles) at 40° (17), gives (20% yield (17)) α,α,β-trichloro-n-butyraldehyde cyanohydrin [Beil. III-322, III_2-(226)], pl. from aq., m.p. 101–102° (17) (18), accompanied by (61% yield (17)) α-chlorocrotonic acid (3:2760), m.p. 98.5–99° (17). — Note that $\bar{C}$ (1 mole) in alc. treated gradually with powdered KCN (2 moles) below 15° over a 3–4 hr. period gives (90% yield (17)) ethyl α-chlorocrotonate (3:8523); in this reactn. the intermediate ethyl α,β-dichloro-n-butyrate readily loses HCl and is generally not isolated; use of alcs. other than EtOH gives good yields of the corresp. alkyl α-chlorocrotonates (17). — Note that for $\bar{C}$ with KCN in C_6H_6 the reaction takes a different course (17). — Finally, note that $\bar{C}$ (1 mole) in conc. aq. NH_4OH first dissolves, then ppts. butyrchloral-ammonia as a heavy oil; the mixt. on satn. with dry NH_3 gas in cold followed by treatment at 10° with powdered KCN (1 mole) evolves heat and gives (93% yield (17)) α-chlorocrotonamide, m.p. 113.5° (17).]

[$\bar{C}$ undergoes condensation with various org. systems: e.g., $\bar{C}$ with phenyl isocyanide (1 mole) in ether for 4–5 days gives (53% yield (19)) α-hydroxy-β,β,γ-trichloro-valeranilide, tbls. from alc., C_6H_6, or $CHCl_3$, m.p. 156–158° (19). — $\bar{C}$ (1 pt.) with malonic acid (1:0480) (1 pt.) in pyridine (1 pt.) at 100° for 3 hrs. evolves CO_2 and gives (20) β-hydroxy-γ,γ,δ-trichloro-n-caproic acid, cryst. from hot aq., m.p. 102° (20). — $\bar{C}$ (1 mole) with nitromethane (1½ moles) in dil. alc. in pres. of Na_2SO_3 at 60° gives (100% yield (21)) 1-nitro-3,3,4-trichloropentanol-2, b.p. 156° at 4 mm., m.p. abt. 20° (21); $\bar{C}$ (1 mole) with nitroethane (1 mole) in 50% alc. in pres. of Na_2SO_3 + K_2CO_3 at 70° gives (22) 2-nitro-4,4,5-trichlorohexanol-3, *b.p. 138° at 0.75 mm.* (22).]

[$\bar{C}$ forms with various org. substances molecular cpds. of pharmaceutical interest: e g., $\bar{C}$ (1 mole) with quinine (base) (1 mole) in abs. alc. at 75° for 1 hr. gives 1:1 cpd., m.p. 139° (note that the corresp. cpd. from chloral (3:5210) + quinine has m.p. 149° (23)). — $\bar{C}$ (1 mole) with 2,3-dimethyl-1-phenylpyrazolone-5 ("Antipyrine") (1 mole) (m.p. 112°) rubbed together and recrystd. from aq. gives (24) *1:1 molecular cpd, colorless pr., m.p. 72°* (for f.p /compn. data and diagram of this system see (24)). — $\bar{C}$ with 2,3-dimethyl-4-dimethylamino-1-phenylpyrazolone-5 ("Pyramidone") (m.p. 107.5°) on fusion or in aq. or C_6H_6 (24) (25) (26) gives a 1:1 mol. cpd. ("Trigemin"), cryst. from C_6H_6, m.p. 85–86° (26), long ndls. from aq., m.p. 84° (24) (for f.p./compn. data and diagram on this system see (24)); for stabilization of "Trigemin" by addn. of 5–10% hexamethylenetetramine (27) or 2% MgO (28) see indic. refs.]

[$\bar{C}$ with various org. hydroxy acids in pres. of conc. H_2SO_4 condenses to give prods. of the chloralide type: e.g., for reactn. of $\bar{C}$ with citric acid (1:0505), malic acid (1:0450), or tartaric acid (1:0525) see (29); with gallic acid (1:0875) (and numerous other phenolic acids) see (30).]

$\bar{C}$ with conc. aq. NH_4OH first dissolves then ppts. a heavy oil of butyrchloral-ammonia (17); cryst. m.p. 62° (see also above for its reaction with KCN).

[$\bar{C}$ with excess dry NH_4OAc on moderate htg for several hrs, then pouring into aq., gives (18) α,α,β-trichloro-n-butyraldimine, cryst from C_6H_6, m p 169–170° (31), 164–165° (18); observe that this m.p. is notably close to that of the condensation prod. of butyrchloral (3:5910) with acetamide, and that latter is readily formed from NH_4OAc by dry htg.; *this matter, however, seems to have received no further attention.*]

$\bar{C}$ with aq. $NH_2OH.HCl$ on htg. readily yields (32) α,α,β-trichloro-n-butyraldoxime (first separating as an oil), cryst. from lgr, m p 65° (32)

The reaction of $\bar{C}$ with arylhydrazines is of special interest and has been extensively studied. With phenylhydrazine the reaction is extremely vigorous (33) (34) and unless carefully controlled (35) may become almost explosively violent yielding only tar. With nuclear-substituted phenylhydrazines, however, the reaction is milder, and their study has shown that all arylhydrazines react in the same general pattern although this comprises several different courses according to the solvent used The pattern will be illustrated here only by the case of 2,4-dichlorophenylhydrazine (see below); for details of the analogous reaction of $\bar{C}$ with phenylhydrazine (33) (34), o-, m-, and p-tolylhydrazines (34), 2,5-dichlorophenylhydrazine (35) (36), 3,5-dichlorophenylhydrazine (35), 2,4,5-trichlorophenylhydrazine (36), 2,4,6-trichlorophenylhydrazine (36), p-bromophenylhydrazine (34), 2,4-dibromophenylhydrazine (37), 4,5-dibromophenylhydrazine (35), and 2,4,6-tribromophenylhydrazine (35) see indic refs.

[The reactn. of $\bar{C}$ (1 mole) with 2,4-dichlorophenylhydrazine hydrochloride (1 mole) first gives the expected butyrchloral 2,4-dichlorophenylhydrazone (*A*) which, however, cannot be isolated because of immediate further reaction in two different modes according to the solvent employed. In dil aq. HCl contg NaOAc (*A*) loses HCl in two different ways leading on one hand to α,β-dichlorocrotonaldehyde 2,4-dichlorophenylhydrazone (*B*), long yel. pr. from alc. or AcOH, m.p. 112° (33), and on the other (simultaneously and with rearr. of unsatd. linkages) to the crimson 1-(2,4-dichlorobenzeneazo)-2,3-dichlorobutene-1 (*C*) (*in most instances the last is not isolatable in pure form although it has been in the case* (37) *of* $\bar{C}$ *with 2,4-dibromophenylhydrazine*), in MeOH, EtOH, or AcOH, however, the two α-chlorine atoms of the initial arylhydrazone (*A*) undergo hydrolysis with consequent formn. of β-chloro-α-keto-n-butyraldehyde 2,4-dichlorophenylhydrazone (*D*), pale yel. pr. from alc., m.p 129° (33).]

[This last type of cpd. (*D*) can be caused to undergo two further important types of reaction: e.g., (*D*) with further 2,4-dichlorophenylhydrazine in MeOH soln. not only undergoes conventional condensation of its α-keto grouping but also has the β-chlorine atom replaced by methoxyl so that the product obtd is β-methoxy-α-keto-n-butyraldehyde bis-(2,4-dichlorophenyl)osazone (*E*), bright yel pr from pyridine or C_6H_6, m.p. 196° dec. (33) (this reaction occurs so readily in MeOH that from $\bar{C}$ + 2,4-dichlorophenylhydrazine hydrochloride both (*D*) and (*E*) are formed and may be separated by fractional crystn.); on the other hand, (*D*) with alc. NaOEt on htg loses HCl and ring-closes (38) to 1-(2,4-dichlorophenyl)-4-hydroxy-5-methylpyrazole (*F*), colorless cryst. from boilg. alc., m.p. 184° (38) (this type of reactn. comprises a general synthesis of 4-hydroxypyrazoles).]

Colorless cryst. from alc. (0.8 ml./g. (5)); somewhat less sol. in alc. than isomeric 2-chlorobiphenyl (3:0300). — Volatile with steam. — [For f.p./compn. curves of systems: C̄ + biphenyl (1:7175), C̄ + 4-fluorobiphenyl, or C̄ + 4-bromobiphenyl, see (7)]

[For prepn. of C̄ from biphenyl (1:7175) with Cl_2 in pres. of Fe (30% yield (5)) (14) (16) (17), or $SbCl_5$ (12), see indic. refs. (2-chlorobiphenyl (3:0300) is also formed; for use of mixt. for transformer oil see (18); for sepn. of mixt. see (19)); for prepn. of C̄ from *p*-aminobiphenyl via diazotization and use of Cu_2Cl_2 reactn. see (2) (7).]

[For prepn. of C̄ from *p*-chloroaniline [Beil. XII-607, XII_1-(604)] via diazotization and coupling of resultant diazonium salt with C_6H_6 in aq. NaOH suspension (yields: 41% (1), 40% (6)) cf. (21) (23) or in aq. NaOAc (yield = 35% (6)), or by formn. of *p*-chlorobenzenediazonium chloride/$ZnCl_2$ cpd. and reactn. of latter with C_6H_6 in AcOH + NaOAc (yield = 34% (20)) see indic. refs.: from *N*-nitroso-acet-*p*-chloroanilide with C_6H_6 in $CHCl_3$ for a few days at room temp. see (13).]

[For formn. of C̄ from decompn. of dibenzoyl peroxide (1:4930) in boilg. chlorobenzene see (22); from decompn. of benzoyl *p*-chlorobenzoyl peroxide see (23); from di-(*p*-chlorobenzoyl) peroxide in C_6H_6 see (24) (4) (3); for formn. of C̄ from 4-hydroxybiphenyl (1:1585) with PCl_5 see (10); from *p*-xenylselenium trichloride on htg. see (25); from *p*-chloroiodobenzene + Cu powder see (2)]

[C̄ with aq 15–30% NaOH at 300–400° under pressure (26) in pres. of Cu (27), or C̄ with aq. Na_2CO_3 + Cu at 300° (28), or C̄ with aq. vapor over cat. at 525–600° (29) gives (75% yield (26)) 4-hydroxybiphenyl (1:1585) (28) (29) or its mixt. with 3-hydroxybiphenyl (1:1475) (27).]

[C̄ with conc. aq. NH_4OH + cat. under press. as directed (30) (31) gives *p*-aminobiphenyl]

[C̄ with Li in dry ether under N_2 gives (32) Li *p*-xenyl. — C̄ with Na sand in C_6H_6 at 110–120° under press. followed by carbonation with CO_2 gives (65–67% yield (33)) biphenyl-4-carboxylic acid (*p*-phenylbenzoic acid) [Beil. IX-671, IX_1-(280)]. — C̄ with Na

+ diethyl carbonate (1:3150) in C_6H_6 as directed gives (yields: 42% (35), 35–40% (36), 39% (37), 23% (38)) tri-(*p*-xenyl)carbinol (*tris*-*p*-biphenylcarbinol) [Beil. VI-738, V_1-(369)], colorless cryst. from AcOH, m.p. 207–208° (36), 207° (38), 206–207° (37). — $\bar{C}$ with Na + benzophenone (1:5150) in C_6H_6 gives (67% yield (34)) diphenyl-*p*-xenylcarbinol [Beil. VI-732], colorless cryst. from lgr., stable form, m.p. 135–136° (34), metastable form, m.p. 112–113° (34).]

[For reactn. of $\bar{C}$ with Na + $AsCl_3$ giving (39) tri-(*p*-xenyl)arsine, with Na + $SbCl_3$ giving (40) tri-(*p*-xenyl)stibine, with Na + PCl_3 giving (41) tri-(*p*-xenyl)phosphine, or with Na + $SiCl_4$ giving (42) tetra-(*p*-xenyl)silane see indic. refs.]

[$\bar{C}$ + stearoyl chloride (3:9960) + $AlCl_3$ in CS_2 gives (43) heptadecyl *p*-chloroxenyl ketone, m.p. 96–97° (43). — $\bar{C}$ + cyclohexene (1:8070) + $AlCl_3$ gives (44) a mixt. of cyclohexyl-*p*-chlorobiphenyls.]

[$\bar{C}$ + phthalic anhydride (1:0725) + $AlCl_3$ as directed (45) (46) gives (93% yield (45)) *o*-[4-(*p*-chlorophenyl)benzoyl]benzoic acid, colorless rods from AcOH or toluene, m.p. 251° cor. (45), 249.6–250.6° (46).]

The nitration of $\bar{C}$ does not appear to have been reported.

$\bar{C}$ on oxidn. with CrO_3 in AcOH yields (10) (25) *p*-chlorobenzoic acid (3:4940), m.p. 237° (10) (25).

75.5–76°	(5) (37)		
75–77°	(6)		
75°	(7)		
72–73°	(8)		

Colorless ndls. from alc., 80% alc., or ether + alc. — Eas. sol. hot alc. but spar. sol. cold alc., eas. sol. ether, spar. sol. cold lgr. [For search for possible polymorphic forms see (4) (9) (10).]

[For prepn. of C̄ from benzoic acid (1:0715) + chlorobenzene (3.7903) with $AlCl_3$ (82.4% yield C̄ + 11.9% 2-chlorobenzophenone (3:0715) (1)), or with P_2O_5 at 180–200° (5), see indic. refs.; from benzoyl chloride (3:6240) + chlorobenzene (3:7903) with $AlCl_3$ (yields: 97% (37), 86% (8), 80–90% (7) (11), 45% (4), 40% (2)) (3) (some 2-chloro isomer also being formed (12)) see indic. refs ; from p-chlorobenzoyl chloride (3:6550) + benzene with $AlCl_3$ (84.6% yield) see (6); from tetra-(4-chlorophenyl)ethylene glycol *bis*-(magnesium iodide) in quant. yield with I_2 or O_2 see (13); from p-chlorobenzohydrylidene-α-phenylethylamine by hydrol. with warm dil. H_2SO_4 see (8).]

[C̄ on reduction with Al/Hg in 80% alc. (3) (14) or with 3% Na/Hg (7) or on boilg. with alc. KOH for 2 days (15), or exposure to sunlight for 7 days of its soln. in isopropyl alc. contg. Na isopropylate, gives (85% yield (3) (14), 80% yield (16)) 4-chlorophenyl-phenylcarbinol (4-chlorobenzohydrol) [Beil. VI-680, VI_1-(327)], m.p. 67.5° (3) (14), 62° (7), accompanied by a little (14% (3) (14)) α,α'-diphenyl-α,α'-*bis*-(4-chlorophenyl)ethylene glycol (*sym.*-4,4'-dichlorobenzopinacol) [Beil. VI_1-(523)], m.p 179° (3) (14). — C̄ with Zn + AcOH yields 4-chlorobenzohydryl acetate (12) or a mixt. (7) of 4-chlorobenzohydrol (above) + the corresp. pinacol (see below).]

[C̄ with Mg + MgI_2 in ether + C_6H_6 or C̄ in very dil. alc. soln. in sunlight (7) gives (94% yield (13)) *sym.*-4,4'-dichlorobenzopinacol, m.p 172–178° (see above). — C̄ with Zn dust + H_2SO_4 in aq. AcOH yields (12) *sym.*-4,4'-dichloro-α-benzopinacoline (*sym.*-4,4'-dichlorotetraphenylethylene oxide) [Beil. $XVII_1$-(45)], ndls. from AcOH, m p. 220° dec. (12). — For oxidn.-reductn. potential of C̄ see (35)]

[C̄ with conc. HI + red P in AcOH refluxed 14 hrs. gives (7) 4-chlorodiphenylmethane [Beil. V-590, V_1-(278), V_2-(500)], b p. 298° at 742.5 mm. (7).]

[C̄ with diphenylmethyl sodium (benzohydryl-sodium) followed by aq. gives (18) corresp. tertiary alc., viz., benzohydryl-p-chlorophenyl-phenyl-carbinol, m.p. 176–178° (18), which with acetyl chloride loses H_2O to give 4-chlorotetraphenylethylene [Beil. V_1-(376), V_2-(679)], m.p. 166–167° (18). — C̄ with MeMgI in dry ether yields (19) p-chlorophenyl-phenyl-methyl-carbinol which on loss of aq. by htg. as directed gives (66% overall yield) α-(4-chlorophenyl)-α-phenylethylene, b.p. 164° at 16 mm. (19); note that this prod. with

Br_2 does *not* add halogen but rather evolves HBr yielding (20) both solid (m.p. 94–95°) and liq. stereoisomers of β-(4-chlorophenyl)-β-phenylvinyl bromide. — $\bar{C}$ with β-(4-chlorophenyl)-β-phenylvinyl MgBr as directed (23) gives 1,4-di-(p-chlorophenyl)-1,4-diphenylbutadiene-1,3, yellowish green ndls. from amyl alc., m.p. 230° (23). — $\bar{C}$ with triphenylmethyl MgBr in ether + C_6H_6, followed by dil. AcOH, gives (21) 78% yield *sym.*-4,4-dichlorobenzopinacol (see above) + 80% yield triphenylmethyl peroxide.]

[$\bar{C}$ with ethyl bromoacetate + Zn in dry C_6H_6 gives (yields: 79% (22), 67% (24)) ethyl β-(4-chlorophenyl)-β-hydroxy-β-phenyl-propionate, m.p 79–80.5° (22), 69° (24); this prod. on htg. with 85% formic acid gives (66% yield (24)) ethyl β-(4-chlorophenyl)cinnamate, b.p. 210–212° at 13 mm. (24), or on hydrolysis gives (22) β-(4-chlorophenyl)-β-hydroxy-β-phenylpropionic acid, m.p. 188.5–189.° dec. (22).]

$\bar{C}$ with PCl_5 at 150° gives (yields: 90% (25) (27), 88% (26) (8)) α,α,4-trichlorodiphenylmethane (4-chlorobenzophenone dichloride) [Beil. V-592, V_1-(279)], b.p. 191–193° at 13 mm. (8), 189–194° at 12 mm. (25). $D_4^{20} = 1.302$ (25), $n_D^{20} = 1.6110$ (25); this prod. with Zn dust refluxed in dry ether for 1 hr. gives (12% yield (25)) α,β-di-(p-chlorophenyl)-α,β-di(phenyl)ethylene, ndls. from alc., m.p. 202–203° (25).

$\bar{C}$ fused with KOH/NaOH gives (28) benzoic acid (66%) + p-chlorobenzoic acid (3:4940) (18%) + a little p-hydroxybenzoic acid (1:0840). — $\bar{C}$ with 10% aq. NaOH in pres. of Cu under press. at 190° yields (29) 4-hydroxybenzophenone (1:1560).

[$\bar{C}$ with NH_3 in pres. of Cu cpds. at 170–300° under press. gives (30) 4-aminobenzophenone [Beil. XIV-81, XIV_1-(388)], lfts. from dil. alc., m.p. 123–124°. — $\bar{C}$ condensed with $NaNH.C_6H_5$ as directed (31) yields 4-anilinobenzophenoneanil, m.p. 56° (for other amines and use of products as antioxidants see (31)); note, however, that by a closely similar method (36) p-chlorobenzophenoneanil, m.p. 64–64.5°, can also be obtd.]

$\bar{C}$ on dinitration with abs. HNO_3 gives (32) a mixt. contg. 4-chloro-3,3′-dinitrobenzophenone, cryst. from toluene, m.p. 166°, 4-chloro-3,2′-dinitrobenzophenone, cryst. from alc, m.p. 123.5°, and 4-chloro-3,4′-dinitrobenzophenone, m.p. 136–136.5°.

Ⓓ **4-Chlorobenzophenone oxime:** This prod. is known in two stereoisomeric forms: the higher-melting isomer, m.p. 155–156° (6) (corresp. acetate, m p. 147–148° (6), corresp. benzyl ether, m.p. 74–75° (6)), which on Beckmann rearr. (6) (34) with PCl_5, with conc. H_2SO_4 at 100°, or with $AcOH/Ac_2O/HCl$ yields 4-chlorobenzanilide, is in the light of modern views on *trans* interchange regarded as the *syn*-(p-chlorophenyl) stereomer; the lower-melting isomer, m.p. 95° (6) (corresp. acetate, m.p. 105–106° (6), corresp. benzyl ether, m.p. 98–99° (6)), which on Beckmann rearr. with PCl_5 yields benz-p-chloroanilide, is now regarded as the *trans*-(p-chlorophenyl) stereomer. [A mixt. of these two stereoisomeric oximes contg. 56% high-melting form + 44% low-melting form (33) is obtd. from $\bar{C}$ with $NH_2OH.HCl$ + pyridine in abs. alc. (33) or from $\bar{C}$ + $NH_2OH.HCl$ + dil. alc. KOH (6); the two isomers are separated by means of their different solubilities in alc. (6) (34). — Note that the lower-melting isomer is itself converted to the higher-melting form by htg. 3 hrs. at 100° (6) and also (in part) during Beckmann rearr.]

Ⓓ **4-Chlorobenzophenone phenylhydrazone:** cryst. from ether/AcOH, m.p. 106° (34). [From $\bar{C}$ with phenylhydrazine or phenylhydrazine acetate in alc. as directed (34).]

—— **4-Chlorobenzophenone p-nitrophenylhydrazone:** unreported.

Ⓓ **4-Chlorobenzophenone 2,4-dinitrophenylhydrazone:** m.p. 184–185° (Heilbron).

3:1915 DI-(TRICHLOROMETHYL) CARBONATE

(Triphosgene, perchlorodimethyl carbonate, hexachlorodimethyl carbonate)

$(Cl_3CO)_2C{=}O$ $C_3O_3Cl_6$

Beil. III - **17**
III₁-(8)
III₂-(16)

M.P.		B.P.	
78–79°	(1)	203° at 760 mm., sl. dec.	(3)
79°	(2) (3) (4)	124° at 50 mm.	(3)
		117° at 36 mm.	(2)
		105° at 22 mm.	(2)

Cryst. from anhydrous ether (1) (2) or pet. eth. (4). — Disagreeable penetrating odor; attacks mucous membrane.

C̄ on distn. dissociates slightly into phosgene (3:5000) and diphosgene (trichloromethyl chloroformate) (3:5515) (4) (5); solid C̄ when mixed with powdered charcoal and heated to just above m.p. rapidly decomposes to phosgene (3:5000) (5).

[For prepn. of C̄ from dimethyl carbonate (1:3046) by chlorination in sunlight see (1); from methyl chloroformate (3:5075) by chlorination see (2).]

C̄ on treatment at 20° for 1 hr. with NaI in acetone evolves CO and separates iodine to 84% of amt. expressed by the reactn. $Cl_3C.O.CO.O.CCl_3 + 6NaI \rightarrow 3CO + 3I_2 + 6NaCl$ (6).

C̄ with most reagents behaves like phosgene; e.g., C̄ with alcohols gives ultimately dialkyl carbonates (7); C̄ with aniline in ether (7) or aq. (2) gives *N,N*-diphenylurea, m.p. 233° (7); C̄ with phenol + aq. NaOH gives (90% yield (7)) diphenyl carbonate (1:2335) cryst. from alc., m.p. 77.5–78° (7).

[For use of C̄ in prepn. of acid chlorides of carboxylic or sulfonic acids see (8); similarly C̄ htd. with anhydrous NaOAc yields Ac_2O (9).]

3:1915 (1) Councler, *Ber.* **13**, 1697–1699 (1880). (2) Grignard, Rivat, Urbain, *Ann. chim.* (9) **13**, 263–265 (1920). (3) Kling, Florentin, Jacob, *Ann. chim.* (9) **14**, 208–210 (1920). 3:1925 1,1-DICHLORO-2-(*o*-CHLOROPHENYL)-2-(*p*-CHLOROPHENYL) ETHYLENE $C_{14}H_8Cl_4$ Beil. S.N. 480

M.P. 78.4–79.5° cor. (1)

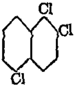
Rectangular pl. from MeOH or EtOH.

[For prepn. of C̄ from 1,1,1-trichloro-2-(*o*-chlorophenyl)-2-(*p*-chlorophenyl)ethane ("*o,p'*-DDT") (3:1820) by elimination of 1 HCl with alc. KOH on refluxing 3 hrs. (97% yield) see (1).]

C̄ on oxidn. with CrO_3/AcOH gives (1) 2,4-dichlorobenzophenone (3:1565), m.p. 64.2–65.2° cor.

3:1925 (1) Haller, Bartlett, Drake, Newman, Cristol, et al., *J. Am. Chem. Soc.* **67**, 1599, 1602 (1945).

3:1930 1,2,5-TRICHLORONAPHTHALENE $C_{10}H_5Cl_3$ Beil. V-544 V_1— V_2—



M.P. 79° (1)
78–78.5° (2) (4)
77° (3)
(*See text.*)

Cryst. volatile with steam. — C̄ if fused at 79° in cap. m.p. tube, and then allowed to cool slowly in the bath or rapidly in air, solidifies at 69° to a translucent cryst. mass which (if the temperature is immediately raised) melts at 74° but if allowed to remain at or below 69° for a few minutes becomes opaque and then melts at 79° (1).

[For prepn. of C̄ from 1-chloro-5-sulfonaphthylamine-2 [Beil. XIV-750] via diazotization and use of Cu_2Cl_2 reactn. see (1) (4); from 1-chloro-2-nitronaphthalenesulfonic acid-5 [Beil. XI-170] (3), 2-chloro-1-nitronaphthalenesulfonyl chloride-5 [Beil. XI-169] (3), 2-chloronaphthalene-1,5-*bis*-(sulfonyl chloride) [Beil. XI-213] (5), or 1,2-dichloronaphthalenesulfonic acid-5 [Beil. XI-163] (2) with PCl_5 see indic. refs.]

[C̄ treated with $ClSO_3H$ in CS_2 and conv. to K salt as directed (1) gives a mixt. contg. 70% (less sol.) K 1,2,5-trichloronaphthalenesulfonate-X (corresp. sulfonyl chloride, m.p. 146°) and 30% (more sol.) K 1,2,5-trichloronaphthalenesulfonate-Y (corresp. sulfonyl chloride, m.p. 179°).]

78.0–79.5°	(3)	316.5° cor.	(7)
78.5°	(4)	315° u.c.	(5) (6)

Colorless cryst. from alc.; 100 pts. 90% alc. dis. in cold 11.91 pts. $\bar{C}$, on boilg. 19.87 pts. $\bar{C}$ *(8)*. — $\bar{C}$ is eas. sol. ether, $CHCl_3$, or CS_2; less so in alc. or C_6H_6.

PREPARATION OF $\bar{C}$

[For prepn. of $\bar{C}$ from *1,1,1-trichloro-2,2-diphenylethane (3:1420)* by splitting out 1 HCl on distn. (9) cf. (10) (6), or with alc. KOH (2) (1) (for study of rate see (11)), or alc. NaOEt (1) see indic. refs.; from *unsym.*-diphenylethane [Beil. V-605, V_1-(285), V_2-(509)] with Cl_2 at 100–150° in quartz flask in light for 10 hrs followed by distn. at ord. press. (16% yield) see (3); from *unsym.*-diphenylethylene [Beil. V-639, V_1-(308), V_2-(543)] with Cl_2 followed by distn. see (12).]

[For formn. of $\bar{C}$ from *α,α-dichloro-β,β-diphenylethylene sulfide* (Cl_2C—$C(C_6H_5)_2$ bridged by S) by htg. at 100° for 2 hrs. (or for shorter time at 160°), or by boilg. with MeOH, or htg. with Zn see (13); from *α,α-dichloro-β,β-diphenylethyl p-tolyl sulfone* with PCl_5 at 200° for 2 hrs. see (4); for formn. of $\bar{C}$ during condensation of chloral (3:5210) with C_6H_6 + $AlCl_3$ in CS_2 see (10) (6).]

CHEMICAL BEHAVIOR OF $\bar{C}$

Reduction. [$\bar{C}$ on reduction with conc. HI + P at 170–210° gives (7) *unsym.*-diphenylethane [Beil. V-605, V_1-(285), V_2-(509)] and bibenzyl (1:7149).]

Addition of halogens. $\bar{C}$ with Cl_2 in dry $CHCl_3$ adds 1 mole halogen giving (6) (5) 1,1,1,2-tetrachloro-2,2-diphenylethane, m.p. 85° (6). — $\bar{C}$ with excess Br_2 htd. on aq. bath until excess reagt. evaporates gives (6) 1,2-dibromo-1,1-dichloro-2,2-diphenylethane, cryst. from alc., m.p. 120.0–120.5° (6).

Behavior with alkalies. [$\bar{C}$ with aq. NaOH at 150°, or with alc. NaOH in s.t. at 100°, is substantially unaffected within 24 hrs. (3); however, $\bar{C}$ with alc. KOH in stainless-steel bomb at 150° for 24 hrs. gives (73% yield (3)) diphenylacetic acid (1:0765), m.p. 147–148° cor. (3) cf. (1). — Note also that, although $\bar{C}$ with dry NaOMe in C_6H_6 does not react even in s.t. at 180° for 36 hrs. yet $\bar{C}$ with dry NaOMe (2 moles) on direct distn. gives diphenylacetylene (tolane) and other products (15).]

[Note also that $\bar{C}$ with Na phenolate at 225° for 24 hrs. gives (3) α-hydroxy-α,α-diphenylacetaldehyde diphenylacetal (benzilaldehyde diphenylacetal), m.p. 111.5°–112° (3).]

Behavior with H_2SO_4 or HNO_3. *With H_2SO_4.* $\bar{C}$ with conc. H_2SO_4 on warming first becomes yellow, then dark green, later violet, and ultimately brownish red. (5) (6).

With HNO_3. $\bar{C}$ on addition to 12 pts. ice-cold fumg. HNO_3 and subsequently pouring onto ice gives (14) 1,1-dichloro-2,2-*bis*-(*p*-nitrophenyl)ethylene, yellowish ndls. from hot alc., m.p. 172° (14); note also that from the mother liquors of recrystn. there can also be obtd. some 4,4′-dinitrobenzophenone, m.p. 188–189°, resulting from some simultaneous oxidn. (14).

Behavior with active metals. [C̄ with Li in dry ether followed by treatment with alc. gives according to conditions (16) (17) (18) either or both 1,2,3-triphenylnaphthalene, m.p. 151–152° (16) (17) (18) (mononitro deriv., m.p. 200–201° (18)), and 1,2,3,4-tetraphenylbutadiene-1,3, m.p. 183° (18) (17) (16); for explanation see (18).]

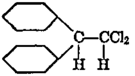
3:1940 1,1-DICHLORO-2,2-DIPHENYLETHANE $C_{14}H_{12}Cl_2$ Beil. V - 606; V_1-(285); V_2-(510)



M.P. 80° (1) (2) **B.P. 295–305° dec.** (1)
74–75° cor. (3)
74° (4) (6)

Colorless cryst. from alc. — C̄ is eas. sol. alc., ether, acetone, AcOH, lgr., or $CHCl_3$. — C̄ with conc H_2SO_4 or with $AlCl_3$ gives a red color.

[For prepn. of C̄ from dichloroacetaldehyde diethylacetal (3:6110) with C_6H_6 + conc. H_2SO_4 (1) (5) (3) (yields not reported) see indic. refs.; for formn. of C̄ from dichloroacetaldehyde (3:5180) with C_6H_6 + $AlCl_3$ (6), or from 1,1,1-trichloro-2,2-diphenylethane (3:1420) during reduction in alc./pyridine with H_2 + Ni (7) or during electrolytic reduction as specified (8) (9) (2), see indic. refs.]

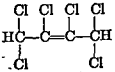
C̄ on distn. at ord. press. (1) or with boilg. alc. KOH (1) or NaOH (2) loses HCl giving 1-chloro-1,2-diphenylethylene [Beil. V-639], m.p. 42°. — Note, however, that C̄ with KNH_2 in liq. NH_3 (3) (5) not only loses HCl but the resulting intermediate reacts further with rearrangement giving (91% yield) diphenylacetylene (tolane) [Beil. V-656, V_1-(319), V_2-(568)].

C̄ on boilg. with aq. is *not* hydrolyzed and no trace of the expected diphenylacetaldehyde results (1).

C̄ on addition to fumg. HNO_3 at 0°, stdg. 24 hrs., and pouring into aq. gives (1) a dinitrobenzophenone of unknown structure (corresp. phenylhydrazone, m.p. 234° (1)).

3:1940 (1) Buttenberg, *Ann.* **279**, 324–327 (1894). (2) Brand, *Ber.* **46**, 2937–2941 (1913). (3) [illegible] (4) Combes, *Ann. chim.* (6) **12**, [illegible] 934). (6) Delacre, *Bul*[illegible] *n.* (2) **115**, 353, 361 (19[illegible] (1921).

3:1945 1,1,2,3,4,4-HEXACHLOROBUTENE-2 (solid stereoisomer) $C_4H_2Cl_6$ Beil. S.N. 11



M.P. 80° (1)

[*See also liquid stereoisomer* (3:9046).]

Colorless shining lfts. (from alc.) with camphoraceous odor. Eas. sol. ether, C_6H_6, $CHCl_3$, or CCl_4.

[For prepn. of C̄ (100% yield (1)) from the solid stereoisomer (3:0870) of 1,2,3,4-tetrachlorobutadiene-1,3 see (1); *for formn. of C̄ from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) by actn. of u.v. light see (1).*] [*Note that octachlorobutane (3:2000)* has also been reported in same reactn.] [For formn of C̄ together with its liquid stereoisomer (3:9046) by actn. of Cl_2 upon the high-boilg. fraction obtd in the prepn. of trichloroethylene (3:5170) from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) see (1).]

C̄ in alc. refluxed with Zn/Cu couple for 1 hr. yields (1) the solid stereoisomer of 1,2,3,4-tetrachlorobutadiene-1,3 (3:0870), m.p. 50° (1).

3:1945 (1) Müller, Hüther, *Ber.* **64**, 589–600 (1931); *C.A.* **25**, 3956–3957 (1931).

3:1960 PIPERONYLOYL CHLORIDE (3,4-Methylenedioxybenzoyl chloride) $C_8H_5O_3Cl$ **Beil. XIX - 270** XIX_1—

M.P. 80° (1) (2) **B.P. 155°** at 25 mm. (2) **140–141°** at 8 mm. (1)

[For prepn. of C̄ from piperonylic acid (1:0865) with excess $SOCl_2$ at 100° (1) or in C_6H_6 (90–95% yield (4)), or with PCl_5 (2), see indic. refs. — Note, however, that at higher temps. the dioxymethylene group is also attacked: e g, piperonylic acid htd. in a s.t. with $SOCl_2$ at 180–200° for 8 hrs. (1) or refluxed 3 hrs. with 3 moles PCl_5 (1) yields *μ,μ*-dichloropiperonoyl chloride (Beil. XIX-272, XIX_1-(743)], b p. 149–150° at 12 mm. (1).]

[C̄ with diazomethane yields (3) piperonyl diazomethyl ketone which with ammonia yields (3) homopiperonylamide, m.p. 173°; C̄ with ethyl sodio-acetoacetate in dry ether, followed by hydrolysis (as specified (4)) of the acetyl group, yields ethyl piperonoylacetate, m p. 42 5° (4).]

C̄ on hydrolysis with aq. yields piperonylic acid (1:0865), m p. 228°.

- ⓓ Piperonylamide [Beil. XIX-270]: tbls. from alc., m.p. 169°.
- ⓓ Piperonylanilide [*N*-phenyl-piperonylamide]: cryst. from dil. alc., m.p. 146–147° cor. (5). [From C̄ + 2 moles aniline in C_6H_6 (5).]
- ⓓ *Piperonylo-p-toluidide: cryst. from dil. alc., m.p. 149–149 5° cor. (5).* [Similarly using *p*-toluidine (5).]
- ⓓ Piperonylo-*α*-naphthalide: cryst. from dil. alc., m.p. 192–193° cor. (5). [Similarly using *α*-naphthylamine (5).]
- ⓓ Piperonylo-*β*-naphthalide: cryst. from dil. alc., m.p. 156 5–157° cor. (5). [Similarly using *β*-naphthylamine (5).]

M.P. 82–83° (1)
81° (2)
80.5° (1)
(*See text.*)

Pr. from ether + alc. — The behavior of $\bar{C}$ on fusion is characteristic: if the fused $\bar{C}$ in a m.p. tube is allowed to cool to 68° and then withdrawn, it immediately solidifies to a translucent mass which on swift reimmersion into the bath shows m.p. 66–67° but if left for a few seconds in the air suddenly becomes opaque forming a cylinder of m.p. 82–83°, retracted from the wall of the capillary m.p. tube. This change (although slower) also occurs in the translucent form if cooled below 66° (1).

[For prepn. of $\bar{C}$ from 1-chloronaphthalene tetrachloride [Beil. V-493] with alc. NaOEt (61.6% yield (1)) (2) (3) see indic. refs.; from 1,3-dichloronaphthol-2 (3:1990) by distn. with PCl_5 see (2); from sodium 1,2,3-trichloronaphthalenesulfonate-7 (1) by hydrolysis with superhtd. steam see (1).]

[$\bar{C}$ treated with $ClSO_3H$ in CS_2 and reactn. prod. conv. to sodium salt as directed (1) gives mixt. of sodium 1,2,3-trichloronaphthalenesulfonate-5 (corresp. sulfonyl chloride, m.p. 131°, corresp. sulfonamide, m.p. 249°) and sodium 1,2,3-trichloronaphthalenesulfonate-7 (corresp. sulfonyl chloride, m.p. 157°, corresp. sulfonamide, m p. 245°) (1).]

[$\bar{C}$ with 7 pts. fumg. H_2SO_4 (10% SO_3) shaken 15 min. at 100° yields (1) 1,2,3-trichloronaphthalene-5,7-disulfonic acid (corresp. *bis*-(sulfonyl chloride), m.p. 184° (1)).]

3:2170 γ-CHLOROCROTONIC ACID (4-Chlorobuten-2-oic acid-1) $C_4H_5O_2Cl$ Beil. II - 418 II_1— II_2—

$$\underset{\displaystyle Cl}{CH_2}\!-\!CH\!=\!CH.COOH$$

M.P. 83° (1) B.P. 117–118° at 13 mm. (5)
82° (2)
81–82° (3) (4)

White cryst., eas. sol. ether or AcOH, can be recrystallized from pet. ether (1) or from hot aq. (5). — $\bar{C}$ distils under reduced press. without decomposition (5). — Note that m.p. 76.7–77.5° first reported (5) was later (2) found to be erroneous and same sample had actually m.p. 81–82° (2).

Note that, although C̄ is capable of existing in two geometrically isomeric forms, only this one is known; collateral evidence (but not actual proof) indicates that C̄ probably represents the *trans* stereoisomer.

[For prepn. of C̄ from ethyl γ-chlorocrotonate (3:8657) by hydrolysis with $Ba(OH)_2$ below 0° (60% yield (1) (6)) (4), or less advantageously with 30% aq. KOH in alc. soln. at −15° (40% yield (1)) (5) (note that γ-chlorovinylacetic acid, m.p. 10° (1), is often obtd. (1) (4) as by-prod.); for formn. of C̄ from β-γ-dichloro-*n*-butyric acid [Beil. II-280] with KOH (poor yield (5)), from *trans*-γ-hydroxycrotonic acid [Beil. III-376] with $SOCl_2$ in pyridine (2), or from methyl α-chloro-α-vinylacetate by hydrolysis (3) (7) (presumably as a result of allylic transposition of α-chloro-α-vinylacetic acid under the influence of alkali) see indic. refs.]

C̄ dissolved in excess aq. 1 *N* NaOH and shaken with H_2 in pres. of Pd/activated carbon is readily dehalogenated giving (95% yield (1)) crotonic acid (1:0425); with sufficient H_2 this prod ultimately reduces to *n*-butyric acid (1:1035).

[C̄ by cat. hydroxylation with $BaClO_3$/osmic acid gives (yields: 75% (6), 78% (9)) *threo*-γ-chloro-α,β-dihydroxy-*n*-butyric acid, m p 100° (9); this prod. with silver oxide as directed replaces Cl by OH giving (59% yield (6)) *d,l*-threonic acid, m.p 98° (6).]

C̄ adds Br_2 (1 mole) yielding (3) γ-chloro-α,β-dibromo-*n*-butyric acid, cryst. from cyclohexane, m.p. 119–120° (3)

C̄ with NaI in dry acetone ppts. NaCl and gives (86% yield (1)) γ-iodocrotonic acid, yel ndls. from lgr., m.p. 108–108.5° (1).

[C̄ on neutralization with NH_4OH and htg. with $(NH_4)_2SO_3$ at 50° for 12 hrs. gives (4) γ-sulfocrotonic acid, very hygroscopic cryst., m.p. 94–96°.]

The acid chloride corresponding to C̄ is unreported.

—— Methyl γ-chlorocrotonate: unreported.

—— Ethyl γ-chlorocrotonate: b.p. 191–193° at 760 mm. (5) (see 3:8657).

—— γ-Chlorocrotonamide: cryst. from hot aq., m.p. 135.5–136° (8), 130–132° (5). [Reported only by partial hydrolysis of γ-chlorocrotononitrile (5) (8).]

—— γ-Chlorocrotonanilide: unreported.

3:2280 3-CHLORO-2-METHYLPHENOL (3-Chloro-o-cresol) C_7H_7OCl Beil. VI - 350 VI₁— VI₂—

M.P. 86° (1) (2) (3) **B.P. 225° (2)**

Long white ndls. (from aq) (1) — Volatile with steam (2).

[For prepn. (75–86% yield) from 3-chloro-2-methylaniline [Beil. XII-836] see (1) (2); from 3-hydroxy-2-methylaniline [Beil. XIII-579] (45–50% yield) see (1).]

$\bar{C}$ on nitration (1) in AcOH with 100% HNO_3 at +10° yields mixt. of equal amts. of two mononitration products: 6-nitro-3-chloro-2-methylphenol [Beil. VI-366], volatile with steam, yel. cryst. from alc., m p. 64 5° (1), and 4-nitro-3-chloro-2-methylphenol [Beil. VI-367], not volatile with steam, cryst. from aq., m p. 135° (1).

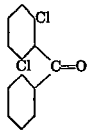
$\bar{C}$ on nitration (4) with 3 pts. HNO_3 (D = 1.48) at 0° gives a dinitro compd., 4,6-dinitro-3-chloro-2-methylphenol, long yel. ndls. from dil. alc., m.p. 82–83° (4); acetyl deriv., m p. 95° (4).

C̄ in alk. soln. coupled with diazotized *p*-nitroaniline yields (1) 3-chloro-2-methyl-6-(*p*-nitrobenzene-azo-)phenol [Beil. XVI-132], cryst. from 50% alc., m.p. 230°.

C̄ in 3 pts. 20% NaOH shaken with 1 pt. $(CH_3)_2SO_4$, distilled with steam, gives 3-chloro-2-methylanisole [Beil. VI-359], b.p. 213.5° (2).

3:2280 (1) Noelting, *Ber.* **37**, 1019–1021 (1904). (2) Ullmann, Panchaud, *Ann.* **350**, 112–113 (1906). (3) Zincke, *Ann.* **417**, 207 (1918). (4) Zincke, *Ann.* **417**, 234–235 (1918).

3:2285 2,6-DICHLOROBENZOPHENONE (2,6-Dichlorophenyl phenyl ketone) $C_{13}H_8OCl_2$ Beil. S.N. 652



M.P. 86° (1)

Colorless cryst. (from alc. (1)).

C̄ does not react with the usual ketone reagents (1).

C̄ fused for 3 hrs. at 200° with a mixt. of KOH + NaOH gives (1) BzOH (1:0715)(96% yield) and *m*-dichlorobenzene (3:5960).

3:2285 (1) Lock, Rödiger, *Ber.* **72**, 869 (1939).

3:2287 2,3,6-TRICHLOROBENZALDEHYDE $C_7H_3OCl_3$ Beil. VII-238 VII_1—

M.P. 86–87° (1)
86° (2) (3)

Colorless ndls. from lgr.

[For prepn. of C̄ from 3-amino-2,6-dichlorobenzaldehyde by diazotization and use of Cu_2Cl_2 reaction see (1) (2).]

C̄ with PCl_5 gives (81% yield (4)) 2,3,6-trichlorobenzal (di)chloride (3:2178), m.p. 83°; note that this prod. depresses m.p. of C̄.

C̄ with 50% aq. KOH at 100° for 5 hrs. under N_2 undergoes cleavage of the aldehyde group giving (88% yield (3)) 1,2,4-trichlorobenzene (3:6420) and the corresp. potassium formate.

C̄ with anhydrous NaOAc + Ac_2O on htg. (Perkin synthesis) gives (64–68% yield (5)) 2,3,6-trichlorocinnamic acid, cryst. from AcOH, m.p. 189°.

[C̄ with MeMgI in dry ether, followed by usual hydrolysis, gives (85% yield (2)) methyl-2,3,6-trichlorophenyl-carbinol, m.p. 87–88°, b.p. 149–155° at 11 mm. (corresp. benzoate, m.p. 106.5°).]

—— **2,3,6-Trichlorobenzaldoxime:** unreported.
—— **2,3,6-Trichlorobenzaldehyde phenylhydrazone:** unreported.
—— **2,3,6-Trichlorobenzaldehyde *p*-nitrophenylhydrazone:** unreported.
—— ***2,3,6-Trichlorobenzaldehyde 2,4-dinitrophenylhydrazone:*** unreported.

3:2287 (1) Geigy [illegible] II 263–264; *C.A.* 2, 3000 (1908).

84–85° (14)
84° (15) (16)

B.P. 275–277° (10)

Long colorless ndls from alc.; volatile with steam; sublimes readily. — Almost insol. cold alc., apprec. sol. boilg. alc.; eas. sol. ether, C_6H_6, $CHCl_3$, CCl_4, or CS_2; spar. sol. conc. HNO_3.

[For prepn. of C̄ from nonachlorobenzophenone-*o*-carboxylic acid [*o*-(pentachlorobenzoyl)-tetrachlorobenzoic acid] [Beil. X_1-(358)] by htg with 10 pts conc. H_2SO_4 at 200–250° for ½ hr. (simplest prepn. of pure C̄) see (12); for formn of C̄ from 2,3,4,5,6-pentachloroacetophenone (6) or 2,3,4,5,6-pentachlorobenzophenone (11) by KOH/NaOH fusion see indic refs, from 2,3,4,5,6-pentachlorobenzaldehyde (3:4892) (2) by htg. with 50% aq KOH 5 hrs at 100° (88% yield) see (2).]

[For prepn of C̄ from 2,3,5,6-tetrachloroaniline (7) via diazotization and use of Cu_2Cl_2 reactn. see (7), from 2,3,5-trichloro-*p*-phenylenediamine via tetrazotization in AcOH with nitrosylsulfuric acid and use of Cu_2Cl_2 reactn (80% yield) see (3).]

[For formn. of C̄ from benzene with Cl_2 (7), or Cl_2 + cat (20), or Cl_2 in pres. of I_2 (18), or $AlCl_3$ (19) see indic refs; from chlorobenzene with Cl_2 + Cu at 200° see (21); from 1,3,5-trichlorobenzene (3:1400) with Cl_2 + Al/Hg see (17); from all three tetrachlorobenzenes with Cl_2 + Al/Hg see (17); from 1,2,4,5-tetrachlorobenzene (3:4115) in $SOCl_2$ or CCl_4 with SO_2Cl_2 + $AlCl_3$ + S_2Cl_2 see (8) (note that under these circumstances *p*-dichlorobenzene (3:0980) gives a mixt. of tetra and hexachlorobenzenes (8) (22)); from lower chlorinated derivs. of benzene by htg. with $FeCl_3$ see (5); from diphenyl sulfone with Cl_2 in sunlight followed by treat. with alc. KOH see (13) (23); from tetrachlorobenzyl chloride with Cl_2 see (16); from acet-*N*-nitro-2,3,5,6-tetrachloroaniline on htg. in toluene or from parent base on attempted acetylation see (15); from trichloroethylene (3:5170) at 700° see (9); from iodopentachlorobenzene with MeOH/NaOH see (1).]

[For formn. of C̄ from various chlorine addition products derived from *o*-dichlorobenzene (3:6055) (4), *m*-dichlorobenzene (3:5960) (4), *p*-dichlorobenzene (3:0980) (4), 1,2,4,5-tetrachlorobenzene (3:4115) (24), and even C̄ itself (25) see indic refs.]

[C̄ with liq. Cl_2 in s.t. in sunlight adds 2 Cl_2 with considerable sluggishness yielding (26) (25) a mixt of two stereoisomeric nonachlorocyclohexenes.]

[C̄ with fumg. H_2SO_4 gives on protracted htg (27) a red dyestuff, sol. in alk. with deep red color.]

[C̄ with $N/2$ NaOMe in MeOH in s.t. at 180° for 7½ hrs. gives (7) 2,3,5,6-tetrachlorophenol, m.p 115° (7) (benzoate, m.p. 136° (28)), accompanied by a small amt. 2,3,4,5-tetrachlorophenol, itself not obtd. pure but yielding (28) a benzoate of m.p. 110° (28). — [For further study of actn. of MeOH/NaOH on C̄ see (29) (30).]

C̄ on nitration, e g, with 7–8 wt. pts. HNO_3 (D = 1.52) at 100° for 1 hr. (7), gives (7) (9) (18) (31) pentachloronitrobenzene [Beil. V-247], ndls. from alc., tbls. from CS_2, m p 146° (9) (18) (31), 143° (7); note that since C̄ is spar. sol. in conc. HNO_3 any unchanged material may separate with the crude prod. (31). — [This pentachloronitrobenzene with

$N/10$ NaOMe in MeOH boiled for 8 hrs. loses NO_2 instead of Cl yielding (31) methyl pentachlorophenyl ether (pentachloroanisole), m.p. 104–105° (31); cf. also under pentachlorophenol (3:4850).]

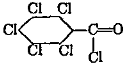
3:2295 PENTACHLOROBENZOYL CHLORIDE



C_7OCl_6 Beil. S.N. 938

M.P. 87° (1)

Colorless tbls. from hot alc.

[For prepn. of C̄ from *unsym.*-tetrachlorophthalyl (di)chloride (3,3,4,5,6,7-hexachlorophthalide) [Beil. XVIII₁-(484)] on htg. at 300° in pres. of Cl_2 see (1).]

C̄ during protracted htg. loses CO yielding (1) hexachlorobenzene (3:4939) (this type of decompn. is generally facilitated by $AlCl_3$ although in this case this aspect has not been reported).

C̄ with MeOH on refluxing for 30 hrs. gives (1) methyl pentachlorobenzoate m.p. 97° (1); note that esterification is slow and that C̄ can be recrystallized from EtOH without change.

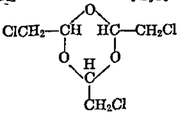
C̄ on hydrolysis with alc. KOH, followed by acidification, yields (1) pentachlorobenzoic acid (3:4910).

3:2295 (1) Kirpal, Kunze, *Ber.* **62**, 2104–2105 (1929).

3:2300 TRICHLOROPARALDEHYDE

(Chloroacetaldehyde trimer; 2,4,6-*tris*-(chloromethyl)-trioxane-1,3,5)

$C_6H_9O_3Cl_3$ Beil. XIX - 386; XIX_1-(807)



M.P. 87–87.5° cor. (1) **B.P. 142–144° at 10 mm. (2)**
140° at 10 mm. (1)

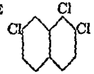
Colorless ndls. from ether; insol. aq., spar. sol. cold alc., eas. sol. hot alc. or in ether.

[For prepn. of C̄ from chloroacetaldehyde (3:7212) (or its hydrate) with ½ vol. cold conc. H_2SO_4 see (1) (3) (4).]

C̄ on distn. at ord. press. (1) (2) (3) (4) depolymerizes to monomeric chloroacetaldehyde (3:7212), b.p. 85°.

3:2300 (1) Natterer, *Monatsh.* **3**, 459–464 (1882). (2) Späth, *Monatsh.* **36**, 6–7 (1915). (3) Helferich, Speidel, *Ber.* **54**, 2634–2635 (1921). (4) Lespieau, *Bull. soc. chim.* (4) **43**, 200–201 (1928).

3:2325 1,2,7-TRICHLORONAPHTHALENE $C_{10}H_5Cl_3$ Beil. V - 545 V_1-(263) V_2—



M.P. 88° also 84° (1) (2)
(*See Text.*)

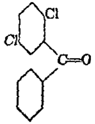
C̄ shows the double m.p. behavior indicated also for several of its isomers, e.g., 1,2,3-isomer (3:2125), 1,2,5-isomer (3:1930), 1,3,8-isomer (3:2420), 1,4,6-isomer (3:1625).

[For prepn. of C̄ from 1-chloro-7-sulfonaphthylamine-2 [Beil. XIV-765] via diazotization and use of Cu_2Cl_2 reactn. see (1) (2); from 1,2-dichloronaphthalenesulfonyl chloride-2 [Beil. XI-184] (2) (3), from 1-chloro-7-nitronaphthalenesulfonyl chloride-2 [Beil XI-188] (4), from 2-chloro-1-nitronaphthalenesulfonyl chloride-2 [Beil. XI-189] (5) (2), or from 1-chloronaphthalene-2,7-*bis*-(sulfonyl chloride) [Beil. XI-217] (2), each with PCl_5 as directed, see indic. refs.]

[C̄ treated with $ClSO_3H$ in CS_2 and reactn prod. conv. to sodium salt as directed (1) yields sodium 1,2,7-trichloronaphthalenesulfonate-X (corresp. sulfonyl chloride, m.p. 176° (1)).]

3:2325 (1) Turner, Wynne, *J. Chem. Soc* **1941**, 247, 252. (2) Armstrong, Wynne, *Chem. News* **71**, 253–254 (1895). (3) Armstrong, Wynne, *Chem. News* **59**, 189 (1889). (4) Cleve, *Chem. Ztg.* **17**, 398 (1893). (5) Cleve, *Ber.* **25**, 2486–2487 (1892).

3:2340 2,5-DICHLOROBENZOPHENONE (2,5-Dichlorophenyl phenyl ketone) $C_{13}H_8OCl_2$ Beil. S.N. 652



M.P. 88° (1) (3)
85–86° (2)

Cryst. (from alc. (1)). — C̄ does not form a $NaHSO_3$ cpd. (1).

[For prepn. (20% yield (1)) from *p*-dichlorobenzene (3:0980) + BzCl (3:6240) + $AlCl_3$ see (1) (2).]

C̄ fused for 3 hrs. at 200° with a mixt. of KOH + NaOH gives (3) *p*-dichlorobenzene (3:0980) (65% yield (3)) and BzOH (1:0715) (91% yield (3)).

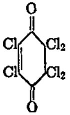
C̄ on oxidn. with $KMnO_4$ soln. yields (1) 2,5-dichlorobenzoic ac. (3:4340), m p. 150° (1).

Ⓓ 2,5-Dichlorobenzophenone oxime: from C̄ in alc. on htg. with $NH_2OH.HCl$ + $BaCO_3$ for 3 days (10% yield (1)); m p. 135° (on rapid htg.), 207° (on slow htg.) (1). [This

oxime upon Beckmann rearr. with 10 pts. conc. H_2SO_4 at 100° for 1 hr. gives benz-2,4-dichloroanilide, m.p. 122° (1).]

3:2340 (1) de Crauw, *Rec. trav. chim.* **50**, 767–768 (1931). (2) Ganzmüller, *J. prakt. Chem.* **138**, 311–312 (1933). (3) Lock, Rödiger, *Ber.* **72**, 869 (1939).

3:2360 2,3,5,5,6,6-HEXACHLORO-CYCLOHEXENE-2-DIONE-1,4



$C_6O_2Cl_6$ Beil. VII - 574 VII₁—

M.P. 89°	(1)	B.P. 275–285° dec.	(1)
86–87°	(2)	182–185° at 45–50 mm.	(1)

Cryst. (from ether/pet. ether). — Lachrymatory odor. — Eas. volatile with steam; on distn. at atm. press. dec. into chloranil (3:4978) and Cl_2. — Eas. sol. ether, $CHCl_3$; fairly eas. sol. alc., C_6H_6, lgr.; insol. aq.

[For prepn. from chloranil (3:4978) by treatment with MnO_2 + conc. HCl in s.t. for 10 hrs. at 180° see (1); from *p*-aminophenol hydrochloride in AcOH on treatment with Cl_2 see (1).]

[For use of C̄ as fungicide see (3).]

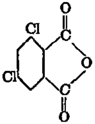
C̄ with KI in AcOH yields (1) chloranil (3:4978). — C̄ on reduction with $SnCl_2$ yields (1) tetrachlorohydroquinone (3:4941).

C̄ on shaking with 10% aq. NaOH slowly dissolves with decompn. into dichloromaleic acid, trichloroethylene, and HCl (1).

Ⓓ 3,5,5,6,6-Pentachlorocyclohexanetrione-1,2,4-anil-2 [Beil. XII-212]: in alm. 100% yield from C̄ (1 pt.) in AcOH (5 pts.) htd. ½–¾ hr. at 100° with aniline (1 pt.), then cooling; red cryst., m.p. 144 (1). [This prod. is stable to conc. HCl but on stdg. with 6–8 pts. 10% aq. NaOH reacts suddenly with evoln. of ht. and odor of carbylamine; after dilution and filtration, acidification of the filtrate ppts. 1-phenyl-3,5,6-trichloropyridone-4-carboxylic acid-2 [Beil. XXII-298], m.p. 245° dec. (1)]

3:2360 (1) Zincke, Fuchs, *Ann.* **267**, 15–24 (1892). (2) Theilacker, *Ber.* **71**, 2069 (1938). (3) Ladd (to U.S. Rubber Co.), U.S. 2,362,565, Nov. 14, 1944; *C.A.* **39**, 2832 (1945).

3:2375 3,5-DICHLOROPHTHALIC ANHYDRIDE



$C_8H_2O_3Cl_2$ Beil. XVII - 483 XVII₁—

M.P. 89° (1) (2)

[*See also 3,5-dichlorophthalic acid* (3:4580).]

Ndls. from lgr.; eas. sol. ether, C_6H_6, $CHCl_3$.

[For prepn. from 3,5-dichlorophthalic acid (3:4580) by htg. [illegible] AcCl (1), see indic. refs.; from 3,5-disulfophthalic [illegible] (2) with [illegible] at 180° see (2).]

C̄ htd. with resorcinol + a drop of conc. H_2SO_4, then dislvd. in alk. and diluted, gives brilliant greenish fluorescence (1).

[C̄ with hydroquinone (1:1590) + $AlCl_3$ + NaCl htd. at 200–220° for 40 min. gives (3) 5,7-dichloro-1,4-dihydroxyanthraquinone (5,7-dichloroquinizarin), red ndls. from xylene, m.p. 231–232° (3).]

[C̄ with steam passed over cat. at 380–420° loses CO_2 presumably yielding (4) 2,4-dichlorobenzoic acid (3:4560) and/or 3,5-dichlorobenzoic acid (3:4840).]

C̄ on melting and treatment with dry NH_3 gas yields (1) 3,5-dichlorophthalimide [Beil. XXI-504], yel. ndls. from hot alc., m p. 208° (1); C̄ on htg. with 1 mole aniline until evoln. of gas stops gives (1) 3,5-dichlorophthalanil [Beil. XXI-504], yel ndls. from alc., m p. 150 0–150.5° (1).

C̄ is insol. in cold aq. but hydrolyzes on boilg ; C̄ on sapon. with standard alk. (Sap. Eq. = 108 5) followed by acidifn. yields 3,5-dichlorophthalic acid (3:4840) q.v.

D_4^{90} = 1.351 (5)

Prisms from C_6H_6 (2), cryst. from pet. eth. (b p. 20–50°) (4). — C̄ is much less reactive but far more lachrymatory (7) than *sym*-*o*-phthalyl dichloride (3:6900). — The m.p. of C̄ is not sharp because of beginning of conversion to *sym.* isomer (4) (5), and C̄ shows progressive change of density when kept at 90° for 1 hr (5) — C̄ on distillation is converted to the *sym.* isomer and therefore shows b.p. of the latter; this change is accelerated by presence of $AlCl_3$ or $SnCl_4$ (1) (2) or by HCl. — C̄ should therefore be preserved in a desiccator over soda-lime (2). — For f.p./compn. diagram of C̄ with its *sym.* isomer see (3); the eutectic has m.p. +8° and conts 23% C̄.

[For prepn. of C̄ from *sym.-o-*phthalyl dichloride by htg with $AlCl_3$ at 100° for 8–10 hrs. (72% yield) see (4).]

C̄ in anhydrous *formic* acid *reacts* below 40° evolving HCl + CO (7) (the *sym.* isomer reacts much more readily, even below 25° (7)).

C̄ on shaking at 0° with 10 vols. 7% aq. NH_4OH followed by acidification yields (1) (7) *o*-cyanobenzoic acid [Beil. IX-814, IX$_1$-(365)], m p 190° dec., converted by htg. to phthalimide, m.p. 228 5° u.c. [Exactly this same result is obtd. with the *sym* isomer.]

[For studies of rate of reactn. of C̄ with MeOH or with aniline see (2) (8).]

[For differentiation of C̄ from its *sym.* isomer by use of piperidinium *N*-piperidyldithiocarbamate (from piperidine + aq. + CS_2) see (6) (7).]

removes the aq. and yields (5) anhydrous C̄ (for conv. of the " hemihydrate " to anhydrous C̄ by use of CaO, $CaCl_2$, $MgCl_2$ see (12)); note, however, that anhydrous C̄ on stdg. in air is converted to the " hemihydrate " in less than 30 min. (11). — C̄ readily sublimes even at room temp. and by repeated sublimation yields (18) anhydrous form.

C̄ has hypnotic, sedative, local anesthetic, and antiseptic characteristics and finds extensive use in medicine and in preservation of biological solns.; it has been used in treatment of nausea and seasickness, e g., German " Nautissan " or (together with caffeine) as the British " Motherhill's Seasick Remedy " (10).

C̄ is also employed as a modifier for cellulose acetate (13) (14) (15) (16) or cellulose ethers (17).

[For detn. of C̄ by complete hydrolysis with hot MeOH/KOH and subsequent detn. of chlorine by either volumetric or gravimetric methods see (3) (19).]

[For prepn. of C̄ from acetone (1:5400) + $CHCl_3$ (3:5050) by addn. of dry powdered KOH (0 5 mole) below 0° (5) or 2–3° (4) or KOH in alc. as directed (11) (yields: 25% (11), 23% (5)) (2) (4) see indic. refs.; note that use of NaOH lowers the yield (5) and that $Ca(OH)_2$ (11), $Zn(OH)_2$ (5), or $Al(OH)_3$ (5) yields no C̄; note also that the crude prod. contains some diacetone alcohol (1:6423) which is best removed by treatment with aq. (11) since otherwise it appears to form with C̄ a const.-boilg. mixt.

[For prepn. of C̄ from trichloroacetyl chloride (3:5420) with MeMgI in ether (4) or from ethyl trichloroacetate (3:5950) with MeMgBr in ether (20) see indic. refs.]

[C̄ with granulated Zn + conc. HCl (in pres. of a little ether) is reduced (21) to *ter*-butyl alc. (1:6140), m.p. 25°, but C̄ in 70% alc. warmed with Zn dust for 5 hrs. gives (4% yield (22)) 1,1-dichloro-2-methylpropene-1 (3:5300) + 1-chloro-2-methylpropene-1 (3:7120) + isobutylene (23). — C̄ with granulated Zn in boilg. AcOH yields (21) *ter*-butyl acetate (1:3057).]

[C̄ with Na/Hg in moist ether (21), or with aq. in s.t. at 180° for 3 hrs. (24), or C̄ with aq. alc. KOH (25) undergoes hydrol. of its $—CCl_3$ group yielding α-hydroxy-isobutyric acid (1:0431), m.p. 79°.]

Anhydrous C̄ in dry ether poured onto a lower layer of colorless fuchsin-aldehyde reagt. (Schiff's soln.) gives a purple color (26), but this behavior is not shown by the " hemihydrate." — C̄ also reduces $NH_4OH/AgNO_3$ soln. slowly in the cold (2).

[C̄ with cold 10% aq. KOH is claimed (27) cf. (29) to yield traces of α-chloroisobutyric acid (3:0235) or carbon monoxide + acetone (28), while C̄ with solid KOH gives (27) methacrylic acid [Beil. II-421, II_2-(398)], and C̄ in MeOH with alk. or tertiary org. bases, or mineral acids, yields (29) methyl methacrylate [Beil. II_2-(398)].]

C̄ with conc. H_2SO_4 (10 wt. pts.) evolves CO + CO_2 + HCl (25) (26); the CO presumably results from the usual action of H_2SO_4 on some α-hydroxy-isobutyric acid (1:0431) first formed by hydrolysis; for the other reactions see (25).

[C̄ with PCl_5 at 100° is claimed (30) (31) (21) to yield both *bis*-(β,β,β-trichloro-*ter*-butyl) ether [Beil. I-383, I_1-(193)], b.p. 156° (30), and 1,1,1,2-tetrachloro-2-methylpropane (3:4725), m p and b p. both at 167° (30), but later workers (26) could obtain no reaction at all between C̄ and PCl_5. — C̄ with PBr_5 at 60° (not above because of dissociation of PBr_5) gives (32) cf. (21) 2,3-dibromo-1,1,1-trichloro-2-methylpropane, b p. 243° (32).]

C̄ with P_2O_5 in dimethylaniline (1) or quinoline (50) htd. at 200° under ord. press. gives (yield: 30–43% (50), 15% (33)) 1,1,1-trichloro-2-methylpropene-2 (3:5605), b.p. 132°, + 57% yield of its synionic isomer 1,1,3-trichloro-2-methylpropene-1 (3:5025), b.p. 45–46°, accompanied by some α-chloroisobutyric acid (3:0235) cf. (50).

[Various reactions of C̄ have been employed in prepn. of pharmaceutical prods.: C̄ with adipic anhydride (see text of 1:0775) at 160–180° for 8 hrs. (35), or C̄ with adipic acid (1:0775) + $SOCl_2$ grad. htd. to 150–160° (36), gives β,β,β-trichloro-*ter*-butyl hydrogen

adipate, cryst. from pet. ether, m p. 70° (35). — $\bar{C}$ with 5-ethyl-5-phenyl-barbituric acid ("Luminal") does *not* (37) show evidence of molecular cpd. formn. but forms a eutectic, m.p. 70.4°, *contg.* 90% $\bar{C}$. — $\bar{C}$ with 2,3-dimethyl-1-phenylpyrazolone-5 ("Antipyrine") does *not* (38) form a molecular cpd. but gives a eutectic contg. 60 mole % $\bar{C}$. — $\bar{C}$ with 2,3-dimethyl-4-dimethylamino-1-phenylpyrazolone-5 ("Pyramidone") gives (39) a molecular cpd., m p. 61–63°. — $\bar{C}$ with chloral (3:5210) or chloral hydrate (3:1270) gives (40) a molecular cpd, m.p. 65°. — See also above (paragraph 4) and below (under Ⓓ's).]

[For reactn. of $\bar{C}$ + $AlCl_3$ (in Friedel-Crafts sense) with benzene, toluene, and *p*-xylene see (31); for reactn of $\bar{C}$ with ethyl sodio-acetoacetate see (25)]

[$\bar{C}$ with aniline in alc. KOH gives according to conditions (41) either β(or α)-anilinoisobutyranilide [Beil. XII-558], cryst. from alc, m.p. 155–157° (41), or β-anilinoisobutyric acid [Beil. XII-497], cryst. from alc., m p 185° (41). — For study of reactions of $\bar{C}$ with *p*-ethoxyaniline (*p*-phenetidine) + alc. KOH see (42); of $\bar{C}$ with *o*-phenylenediamine + alc. KOH see (41)]

Ⓟ **Carbylamine test:** $\bar{C}$ with aniline + aq. alk. on warming gives characteristic odor of phenyl isocyanide (phenyl carbylamine).

Ⓟ **Iodoform reaction:** $\bar{C}$ in aq. soln. (1/200) treated with aq NaOH + I_2/KI soln gives yel. ppt. of iodoform (m p. 119°) with its characteristic odor.

—— **β,β,β-Trichloro-*ter*-butyl acetate:** oil, b.p. 191° (21), 190–191° (4), 151–152° at 237 mm (43). [From $\bar{C}$ (1 pt.) with Ac_2O (2 pts.) + anhyd. NaOAc (1 pt.) refluxed 2 hrs (85% *yield* (43)), *or from* $\bar{C}$ (1 *mole*) *with AcCl* (1 *mole*) *under reflux* (37% yield (21)).] — [Note that this ester, although unaffected by 10% aq. NaOH at 100° for 20 min. (dif. from $\bar{C}$ which is hydrolyzed), is rapidly saponified by boilg. with 3–4 vols. conc. HNO_3 for a few minutes, and upon dilution with aq. ppts. $\bar{C}$ (43)]

Ⓓ **β,β,β-Trichloro-*ter*-butyl benzoate:** cryst. from alc. upon addn. of aq, m.p. 34–35° (44) (45). [From $\bar{C}$ with BzCl at 100° until evoln. of HCl stops (6 hrs.) (44) (45), or from $\bar{C}$ + benzoic acid (1:0715) in pres. of $ZnCl_2$ (45)] — [Note that this ester on boilg. with conc. HNO_3 is *not* hydrolyzed (dif. from esters of $\bar{C}$ with aliphatic acids, e.g, acetate (above)), but nitrated (46) yielding mainly β,β,β-trichloro-*ter*-butyl *m*-nitrobenzoate (see below).]

Ⓓ **β,β,β-Trichloro-*ter*-butyl *o*-nitrobenzoate:** pl. from alc., m.p. 91° (46) (47) [From $\bar{C}$ with *o*-nitrobenzoyl chloride on warming (46) (47).]

Ⓓ **β,β,β-Trichloro-*ter*-butyl *m*-nitrobenzoate:** pl. from alc., m.p. 87° (46) (47). [From $\bar{C}$ with *m*-nitrobenzoyl chloride on warming (46) (47), or from β,β,β-trichloro-*ter*-butyl benzoate (above) by nitration with excess conc. HNO_3 below 50° (46) (47)]

Ⓓ **β,β,β-Trichloro-*ter*-butyl *p*-nitrobenzoate:** ndls. from alc., m.p. 145° (46) (47). [From $\bar{C}$ with *p*-nitrobenzoyl chloride on warming (46) (47).]

Ⓓ **β,β,β-Trichloro-*ter*-butyl 3,5-dinitrobenzoate:** unreported.

—— **β,β,β-Trichloro-*ter*-butyl carbamate:** pl. from C_6H_6, m.p. 102° (48) (49). [From $\bar{C}$ with Na in C_6H_6 at room temp. for 4 hrs., followed by conversion of the presumably resultant metal alcoholate with phosgene (3:5000) in toluene to β,β,β-trichloro-*ter*-butyl chloroformate (not isolated), and reaction of the latter in the C_6H_6/toluene soln. with dry NH_3 gas (55% yield (48)) (49); note that earlier attempts (26) to obtain a metal alcoholate in toluene had led to serious explosions (cf. alkali metals with $CHCl_3$) (3:5050).]

—— **β,β,β-Trichloro-*ter*-butyl *N*-phenylcarbamate:** ndls. from C_6H_6, m.p. 118° (48). [From $\bar{C}$ as in the preceding case except that aniline was used in place of NH_3 in last step; yield is poor (48)]

—— **β,β,β-Trichloro-*ter*-butyl *N*-(α-naphthyl)carbamate:** unreported.

	90–94°	(3)			

[*See also 4-chlorophthalic acid* (3:4390).]

Cryst. from CCl_4 (5) (4), from Ac_2O (2), from ether, or from alc. (For crystallographic consts. see (2)) — Eas. sol. alc., ether, $CHCl_3$; less sol. CS_2; spar. sol. lgr.

[For use of $\bar{C}$ with glycerol or ethylene glycol in prepn. of glyptal type resins see (26).]

[For prepn. of $\bar{C}$ from 4-chlorophthalic acid (3:4390) by htg. or sublimation (6) (7) (8) (1) (9) or by htg with AcCl (2) see indic. refs; from $NaH\bar{A}$ with conc. H_2SO_4 at 100° see (10); from phthalic anhydride (1:0725) with Cl_2 in pres. of Fe or Fe salts at 160–260° see (11) (note that crude $\bar{C}$ obtd. by chlorination methods or from 4-chlorophthalic acid obtd. by chlorination methods may cont. dichlorophthalic anhydrides from which $\bar{C}$ is separable by its greater soly. in toluene (4)); from 4-nitrophthalic anhydride [Beil. XVII-486, XVII$_1$-(256)] with Cl_2 at 240° see (12)]

[$\bar{C}$ with Cl_2 in fumg H_2SO_4 in pres. of I_2 gives (13) mixt. contg much 3,4-dichlorophthalic anhydride (3:3695), m.p. 120–121°, b.p. 329°, and little 4,5-dichlorophthalic anhydride (3:4830), m p. 187°.]

[$\bar{C}$ with $SOCl_2 + ZnCl_2$ in s.t. at 240° yields (27) 4-chlorophthalyl (di)chloride [Beil. IX-817], b.p. 275–276° (6).]

[$\bar{C}$ in MeOH satd. with dry HCl yields (6) dimethyl 4-chlorophthalate, ndls. from lgr., m.p. 38° (5), m.p. 37° (6), b p. 186–187° at 32 mm. (5); $\bar{C}$ in EtOH similarly gives (6) diethyl 4-chlorophthalate, b p 173–174° at 16 mm. (14), 300–305° (6)]

$\bar{C}$ fused and treated with dry NH_3 gas (6) or $\bar{C}$ htd with urea (28) yields 4-chlorophthalimide [Beil XXI-503, XXI$_1$-(391)], m p 210–211° (6) (3). [Ring opening of this prod. with NaOCl yields (9) 3 pts. 4-chloro-2-aminobenzoic acid (4-chloroanthranilic acid) [Beil. XIV-365, XIV$_1$-(518)], m p. 235–236° (9), and 1 pt. 5-chloro-2-aminobenzoic acid as "anhydride," m.p 178–179° (9)] [For use of 4-chlorophthalimide in prepn. of pigments of phthalocyanine type see (28).]

[$\bar{C}$ fused with aminoacetonitrile hydrochloride or sulfate yields (15) 4-chlorophthalimidoacetamide, ndls. from hot aq., m p. 241° (15); $\bar{C}$ htd with methyleneaminoacetonitrile until evoln of CH_2O ceases yields (15) 4-chlorophthalimidoacetonitrile, ndls. from dil. AcOH, m p 146.5° (15); $\bar{C}$ htd. with glycine yields (15) 4-chlorophthalimidoacetic acid, yel. pl. from hot aq or dil alc., m p. 205° (15)]

[$\bar{C}$ with 2 moles phenol htd with $ZnCl_2$ at 115–130° for 48 hrs. as directed (2) gives 70% yield phenol (di)chlorophthalein, m p 214–233°, and prob. a mixt. of isomers; $\bar{C}$ with resorcinol htd with trace conc. H_2SO_4 yields (6) a prod. behaving as dichlorofluorescein. — Note, however, that $\bar{C}$ with hydroquinone (1:1590) + $AlCl_3$ + NaCl htd. at 200–220°

(4) or $\bar{C}$ with *p*-chlorophenol (3:0475) + fumg. H_2SO_4 + H_3BO_3 htd. 20 hrs. at 175–195° gives (95% yield (4)) 6-chloro-1,4-dihydroxyanthraquinone (6-chloroquinizarin), tbls. from toluene, m.p. 188° (diacetate, m.p. 213°, dimethyl ether, m.p. 168.5° (4)).]

[$\bar{C}$ with C_6H_6 + $AlCl_3$ yields (6) (3) 4-chloro-2-(benzoyl)benzoic acid [Beil. X-750, X_1-(356)], cryst. from xylene, m.p. 180.5° (3), from C_6H_6, m.p. 170° (6) (this on ring closure with conc. H_2SO_4 at 160–170° for 10 min. gives 2-chloroanthraquinone (3:4922), m.p 204° (3). — $\bar{C}$ with chlorobenzene (3:7903) + $AlCl_3$ yields (3) (17) 4-chloro-2-(*p*-chlorobenzoyl)benzoic acid [Beil. X_1-(357)], cryst. from xylene, m.p. 195.5° (3) (this on ring closure as above gives (3) 2,6-dichloroanthraquinone [Beil. VII-788, VII_1-(413)], m.p. 278° (3)). — For similar condensations of $\bar{C}$ + $AlCl_3$ with *p*-dichlorobenzene see (3), with bromobenzene see (18), with naphthalene see (25) (19), with toluene see (19) (20), with perylene see (21) (22), with 2,2′-dinaphthyl see (23).]

[For use of $\bar{C}$ in prepn. of pigments of the phthalocyanine type see (24) (28).]

$\bar{C}$ on warming with aq. readily hydrolyzes; $\bar{C}$ on saponification with standard alk. (Sap. Eq. = 91.3) followed by acidification yields 4-chlorophthalic acid (3:4390) q.v.

3:2760 α-CHLOROCROTONIC ACID (*trans*-2-Chlorobuten-2-oic acid)

$C_4H_5O_2Cl$ Beil. II - 414, II_1-(189), II_2-(395)

M.P.	**99.5–100°**	(1) (15)	**B.P. 212°** (10) (11)
	99–100°	(2) (3)	**111–112° at 14 mm.** (11)
	99–99.5°	(6)	
	99.5°	(4)	
	99.2°	(5) (26)	
	99°	(7) (12) (27)	
	98.5–99°	(8) (11)	
	97–98°	(17)	
	97.5°	(9) (20)	
	96°	(10)	

[*See also α-chloroisocrotonic acid* (3:1615).]

Ndls. from aq. (4) (20) or pet. eth. (8). — $\bar{C}$ is sol. in 47.1 pts. aq. at 19° (13); 100 pts. satd. aq. soln. at 12.5° cont. 1.97 pts. $\bar{C}$ (9). — $\bar{C}$ is less (9) (5) volatile with steam than the isomeric α-chloroisocrotonic acid (3:1615). — Eas. sol. alc. or ether (10). — Readily sublimes (10). — Note that the m.p. of mixts. of $\bar{C}$ with β-chlorocrotonic acid (3:2625) is depressed far below either (4).

[For thermal anal. of system $\bar{C}$ + 2,6-dimethylpyrone see (12); with conc. H_2SO_4 see (14).]

Preparation. For prepn. of $\bar{C}$ from α,α,β-trichloro-n-butyric acid (3:1280) [itself readily obtd. from α,α,β-trichloro-n-butyraldehyde (butylchloral) (3:5910) by oxidn. with HNO_3] by *removal of two halogen atoms with Zn dust + aq. (83% yield on initial butylchloral hydrate (3))* (10), or with Zn + HCl (15), see indic refs.; from the higher-melting form of α,β-dichloro-n-butyric acid ("isocrotonic acid dichloride") (3:1903) by splitting out HCl with alc. KOH see (17) (18); from the lower-melting form of α,β-dichloro-n-butyric acid ("crotonic acid dichloride") (3:1375) by splitting out HCl with excess aq. NaOH (5) (18) or with pyridine at 100° for 3 hrs. (4) or with 1% Am_3N refluxed at 160–180° for 16 hrs. (85% yield (28)) (note, however, that with NaOH the yield is low and much of the isomeric α-chloroisocrotonic acid (3:1615) is formed); from α-chloro-β-hydroxy-n-butyric acid [Beil. III-309, 310] by elimination of H_2O with warm 80% H_2SO_4 see (17).]

[For prepn. of $\bar{C}$ from α,α,β-trichloro-n-butyraldehyde (butylchloral) (3:5910) by simultaneous oxidn. and elimination of HCl with aq. $K_4Fe(CN)_6$ (yield 44.3% (3)) (19) see indic. refs.]

[For formn. of $\bar{C}$ from crotonic acid (1:0425) by actn. of Cl_2 and distillation of product see (20); from α-chloroisocrotonic acid (3:1615) by htg. in s.t. at 150–160° for 12 hrs. (21), with pyridine HCl in pyridine 7 days at room temp (4), or to small extent even on steam distn. (22) see indic. refs.; from the methyl, ethyl, or n-propyl esters of α-chloro-α-vinylacetic acid or from α-chloro-α-vinylacetonitrile (or amide) on hydrolysis with alkali (note shift of double bond from β,γ to α,β position) see (11); from ethyl α-chlorocrotonate (3:8523) by hydrolysis with conc. HCl see (23).]

Chemical behavior. [$\bar{C}$ on reduction with Na/Hg is dehalogenated yielding (10) crotonic acid (1:0425), m.p. 72°; note, however, that $\bar{C}$ does not readily absorb H_2 even in pres. of Pt black (11).]

$\bar{C}$ with Cl_2 in CS_2 adds 1 mole halogen yielding (24) α,α,β-trichloro-n-butyric acid (3:1280), m.p. 59.5–60°. — $\bar{C}$ adds Br_2 readily (15) yielding (10) α,β-dibromo-α-chloro-n-butyric acid [Beil. II-286], m.p. 92° (10).

$\bar{C}$ with fumg. HCl in s.t. at 100° for 5 hrs. adds 1 HCl to double bond yielding (17) (18) the higher-melting α,β-dichloro-n-butyric acid (3:1903), m.p. 78°.

$\bar{C}$ behaves as a monobasic acid; dissociation const. at 25° is 7.2×10^{-4} (25); Neut. Eq. 120.5.

[Salts: $NH_4\bar{A}$, lfts. or hexag. tbls., sublimable (10); $Na\bar{A}$ (10); $K\bar{A}$, lfts. from alc. in which it is spar. sol. (1 pt. $K\bar{A}$ in 736.4 pts 99% alc. at 16.5° (5)) (use in sepn. of $\bar{C}$ from the isomeric α-chloroisocrotonic acid (3:1615) (4) (18) (17)); $Ag\bar{A}$, ndls., spar. sol. aq. (10) (17); $Ca\bar{A}_2$, pr. spar. sol. cold aq. (10) (17); $Ba\bar{A}_2$, more sol. aq. than $Ca\bar{A}_2$ (10) (17); $Cu\bar{A}_2$, blue ndls., converted by warm aq. to a basic salt (10); $Pb\bar{A}_2.H_2O$ (10).]

[$\bar{C}$ with NaOEt is unchanged even at 215° (20), but $\bar{C}$ with 10 N KOH at 100-200° decomposes with formn. of AcOH (1:1010), oxalic acid (1:0445), $CO_2 + H_2$ + other prods. (20).]

[For study of rate of reactn. of $\bar{C}$ with K_3AsO_3 see (2).]

[$\bar{C}$ with PCl_5 on warming gives (10) α-chlorocrotonoyl chloride, liq. with sharp odor, b.p. 112° (10).]

—— Methyl α-chlorocrotonate: b.p. 161–162° (see 3:5870). [For study of rate of esterification of $\bar{C}$ with MeOH see (26) (27).]

—— Ethyl α-chlorocrotonate: b.p. 176° (see 3:8523).

Ⓓ α-Chlorocrotonamide: lfts., spar. sol. cold aq., eas. sol. alc.; m.p. 113.5° (8), 111.5–112.5° (11), 107° (10). [From α-chlorocrotonyl chloride (above) (10) or ethyl α-chlorocrotonate (11) with conc. aq. NH_4OH; also by other routes such as from α,α,β-trichloro-*n*-butyraldehyde (3:5910) with NH_4OH + KCN (93% yield (8)).]

—— α-Chlorocrotonanilide: unreported.

—— α-Chlorocroton-α-naphthalide: unreported.

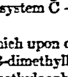
3:2885 3,4,5-TRICHLOROPHENOL



$C_6H_3OCl_3$

Beil. VI —
VI₁—
VI₂-(181)

M.P. 101° (1) (4)
99–100° (2)
91° (3)

B.P. 271–277° u.c. at 746 mm. (3)

Ndls. from lgr. — Volatile with steam. — Ionization const. at 25° is 4.5×10^{-9} (4); $\bar{C}$ is too weakly acidic to be titrated (1) although sol. in alk.

[For prepn. from 3,4,5-trichloroaniline via diazo react. (51% yield) see (1) (2); by cleavage of 3,4,5-trichloroanisole see (3).]

C̄ treated with large excess Br_2 yields 2,6-dibromo-3,4,5-trichlorophenol, ndls. from AcOH, m.p. 180° (3).

The methyl ether of C̄, 3,4,5-trichloroanisole, prepared indirectly, has m.p. 63° (3).

Ⓓ 3,4,5-Trichlorophenyl benzoate: from C̄ + BzCl + 20% NaOH; ndls. from alc., m.p. 120° (3).

3:2885 (1) Tiessens, *Rec. trav chim* **50**, 113 (1931) (2) Herzberg, Scharfenberg, Ger. 367,362, Jan. 20, 1923, *Cent.* **1923**, II 1254. (3) Kohn, Kramer, *Monatsh.* **49**, 163–165 (1928). (4) Tiessens, *Rec. trav chim.* **48**, 1066–1068 (1929).

3:2910 4,5-DICHLORO-2-METHYLPHENOL (4,5-Dichloro-*o*-cresol)

$C_7H_6OCl_2$ Beil. VI — VI_1-(174) VI_2-(333)

M.P. 101° (1)

Ndls. from pet. ether; spar. sol. pet. ether, eas. sol. alc., AcOH, C_6H_6.

[For prepn. of C̄ from 4-chloro-2-methylphenol (3:0780) with Cl_2 in $CHCl_3$ see (1).]

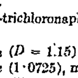
C̄ in 2 pts. ice-cold HNO_3 ($D = 1.48$) stood for 12 hrs. gives (75% yield (1)) a prod. of compn. $C_7H_4O_8N_3Cl_2$, white ndls. from dry ether by addn. of pet. ether, m.p. 110° dec. (1).

C̄ in AcOH on mononitration yields (1) 4,5-dichloro-6-nitro-2-methylphenol [Beil. VI_1-(179)], yel. ndls. from pet. ether, m.p. 69° (1)

Ⓓ 4,5-Dichloro-2-methylphenyl benzoate: ndls. from C_6H_6, m.p. 80–81° (1). [From C̄ in alk. soln. on shaking with benzoyl chloride (1).]

3:2910 (1) Zincke, *Ann.* **417**, 207, 231–233 (1918).

3:2935 2,3-DICHLORONAPHTHOL-1



$C_{10}H_6OCl_2$ Beil. VI-612 VI_1— VI_2—

M.P. 101° (1)

Subl. in ndls.; spar. sol. cold aq., mod. sol. hot aq.; eas. sol. alc., ether, AcOH, $CHCl_3$, C_6H_6.

[For prepn. from sodium 1-naphtholsulfonate-2 by htg. with PCl_5 at 100–120° see (1).]

C̄ dis. in hot Na_2CO_3 yielding sol. Na salt.

C̄ htd. with PCl_5 at 130–140° yields 1,2,3-trichloronaphthalene (3:2125), colorless ndls. from alc, m p. 90° (1).

C̄ on oxidn. in s.t. at 200° with dil. HNO_3 ($D = 1.15$) yields (1) phthalic ac. (1:0820), converted in m.p. tube to phthalic anhydride (1·0725), m.p. 128° (1).

C̄ on oxidn. with CrO_3 in AcOH or dil. H_2SO_4 gives (although in poor yield (1)) 2,3-dichloronaphthoquinone-1,4 (3:4857), gold-yel. ndls. (from alc.), m.p. 190°.

3:2935 (1) Claus, Knyrim, *Ber.* **18**, 2926–2929 (1885).

3:2965 8-CHLORONAPHTHOL-2  $C_{10}H_7OCl$ Beil. VI - 649 VI₁— VI₂-(604)

M.P. 101° u.c. (1) **B.P.** 307–308° (1)
101° (2) (3) (5)

Ndls. from lgr.; very eas. sol. alc., ether, AcOH; C_6H_6, $CHCl_3$; spar. sol. pet. ether. — Volatile with steam. — Č depresses m.p. of 6-chloronaphthol-2 (3:3500) to 79–88° (5).

[For prepn. of Č from sodium 2-hydroxynaphthalenesulfonate-8 [Beil. XI-286, XI_1-(67)] with 2 moles PCl_5 at 150–160° see (1) (note that some 1,7-(2,8)dichloronaphthalene (3:1385) is also formed and that its proportion increases with more PCl_5 or at higher temps. (1)); from 8-aminonaphthol-2 [Beil. XIII-685] via diazotization and use of Cu_2Cl_2 reactn. see (2); for formn. of Č (20% yield (3)) from β-naphthol (1:1540) by treatment with soln. of $Na_2CO_3 + Cl_2$ see (3) (note that 30% of 2,2′-dihydroxybinaphthyl-1,1′ [Beil. VI-1051, VI_1-(519)] together with a tar is also formed (3)).]

[Č (2 pts.) with benzaldehyde (1 pt.) with 7 pts. HBr/AcOH soln. stood for 24 hrs. gives (75% yield (2)) *meso*-phenyl-dichlorodibenzoxanthane, colorless ndls. from acetone, m.p. 213–214.5° (2).]

[Č (as sodium salt) treated with CO_2 under press. at elevated temp. as directed gives (4) 8-chloro-2-hydroxynaphthoic acid-3, pale yel. ndls. from hot C_6H_6, m.p. 250° (4).]

Ⓓ 8-Chloro-2-naphthyl *m*-nitrobenzoate: citron-yel. ndls. from hot C_6H_6 on addn. of 4 vols. hot alc., m.p. 176° (5). [From Č in warm dil. aq. NaOH on shaking with *m*-nitrobenzoyl chloride (5).]

3:2965 (1) Claus, Volz, *Ber.* 18, 3157–3158 (1885). (2) Dilthey, Quint, Heinen, *J. prakt. Chem.* (2) 152, 73–75 (1939)
II 767; *C.A.* 22, 339
Cent. 1933, II 446.

3:2990 *p*-CHLOROPHENACYL CHLORIDE (Chloromethyl *p*-chlorophenyl ketone) $C_8H_6OCl_2$ Beil. VII - 282 VII₁-(152)

M.P. 101–102° (2) **B.P.** 270° (1)
101° (1)

Ndls. (from alc.).

[For prepn. from *p*-chloroacetophenone (3:6735) by chlorination in CS_2 see (1); from chloroacetyl chloride (3:5235) + chlorobenzene (3:7903) + CS_2 + $AlCl_3$ see (2).]

Č on oxidn. with alk. $KMnO_4$ yields *p*-chlorobenzoic ac. (3:4940).

Č on treatment with Br_2 gives (3) ω-bromo-*p*-ω-dichloroacetophenone, cryst. from alc., m.p. 83–83.5° (3). — Č with KCN yields (4) *p*-chlorobenzoylacetonitrile, m.p. 129.5–130° (4). — Č with KSCN yields (4) *p*-chlorophenacyl thiocyanate, m.p. 138.6–139.2° (4). — Č with Na_2S at 60° gives (5) *bis*-(*p*-chlorophenacyl) sulfide, m.p. 121–121.6° (5).

Č in MeOH treated with $NH_2OH.HCl$ yields (6) corresponding oxime, chloromethyl *p*-chlorophenyl ketoxime, m.p. 100.5–101° (6). [Note that although this deriv. has m.p. too similar to that of original Č to be used as identification itself, upon htg. at 100° with conc. H_2SO_4 and pouring into aq. it is converted by Beckmann rearr. to chloroaceto-*p*-chloroanilide [Beil. XII-612], m.p. 168° (6), ndls. from alc., m.p. 169° (7).]

C̄ (1 mole) in alc. gradually added to phenylhydrazine (2 moles) in alc. with cooling ppts. (8) 1-phenyl-3-chlorophenyl-Δ^2-diazene-1,2, yel ndls. from alc., m.p. 164–164.5° (8).

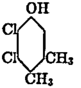
CHAPTER VIII

DIVISION. A. SOLIDS

(3:3000–3:3499)

3:3005 5,6-DICHLORO-3,4-DIMETHYLPHENOL (5,6-Dichloro-*o*-4-xylenol)



$C_8H_8OCl_2$ Beil. S.N. 529

M.P. 102.5° (1)
102° (2)

Cryst. from lt. pet. — Very sol. most organic solvents. — Volatile with steam.

[For prepn. of $\bar{C}$ from 5,6-dichloro-3,4-dimethylaniline (5,6-dichloro-*o*-4-xylidine) (3) via diazotization and hydrolysis (yield not stated) see (1); for formn. of $\bar{C}$ from 4,5,6-trichloro-1,1-dimethylcyclohexen-4-one-3 with conc. H_2SO_4 at 110–120° (yield not stated) see (2).]

$\bar{C}$ with Cl_2 in lt. pet. readily gives (2) 2,5,6-trichloro-3,4-dimethylphenol (3:4747), m.p. 182°.

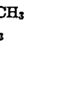
The nitration of $\bar{C}$ has not been reported, and the expected 2-nitro-5,6-dichloro-3,4-dimethylphenol is unknown.

—— 5,6-Dichloro-3,4-dimethylphenyl acetate: unreported.

Ⓓ 5,6-Dichloro-3,4-dimethylphenyl benzoate: m.p. 97.5° (1), 94° (2).

3:3005 (1) Hinkel, Ayling, Bevan, *J. Chem. Soc.* 1928, 2532–2533. (2) Hinkel, *J. Chem. Soc.* 125, 1851 (1924). (3) Hinkel, Ayling, Bevan, *J. Chem. Soc.* 1928, 1877.

3:3015 1,3,5-TRICHLORONAPHTHALENE



$C_{10}H_5Cl_3$ Beil. V - 545
V_1-(263)
V_2-(446)

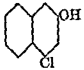
M.P. 103° (1) (2) (4)
102–103° (3)
94° (8)

[For prepn. of $\bar{C}$ from 1,3-dichloronaphthalenesulfonyl chloride-5 [Beil. XI-163] (4) (5), from 1,5-dichloronaphthalenesulfonyl chloride-3 [Beil. XI-182] (1), from 1-chloro-5-nitronaphthalenesulfonyl chloride-3 [Beil. XI-182] (6), or from 1-chloronaphthalene-3,5-*bis*-(sulfonyl chloride) [Beil. XI-215] (7), each with PCl_5 as directed, see indic. refs.; from 1,7-dichloronaphthylamine-3 (8) via diazotization and use of Cu_2Cl_2 reactn. see (8); for formn. of $\bar{C}$ (together with other products) from 1-nitronaphthalene [Beil. V-553, V_1-(264)] with Cl_2 (2) in pres. of $I_2 + FeCl_3$ (3) see indic. refs.]

[$\bar{C}$ treated with $ClSO_3H$ in CS_2 and reactn. prod. conv. to K salt as directed (1) yields potassium 1,3,5-trichloronaphthalenesulfonate-7 (corresp. sulfonyl chloride, m.p. 152° (1)).]

3:3015 (1) Turner, Wynne, *J. Chem. Soc.* **1941**, 247, 253. (2) Atterberg, *Ber.* **9**, 317 (1878). (3) Buffle, Corbaz, *Arch. sci. phys. nat.* **14**, 149–158 (1932); *Cent.* **1932**, II 3394. (8) Friedländer, Karamessinis, Schenk, *Ber.* **55**, 48–49 (1922).

3:3045 4-CHLORONAPHTHOL-2



$C_{10}H_7OCl$ Beil. S.N. 538

M.P. 104° (1)
103–104° (2)
102–103° (2)
100° (4)

Ndls. from lgr. or 30% aq. alc.

[For prepn of $\bar{C}$ from 1,4-dichloronaphthol-2 (3:3840) by partial reduction with $SnCl_2$ in AcOH/HCl at 100° in s.t. for 8 hrs (74% yield (2)) (1) see indic. refs., from 4-chloronaphthol-2-sulfonic acid-1 (2) (see also under 3:3840) by hydrolysis of the sulfonic acid group (91% yield) see (2); from 4-chloronaphthalene-1,2-diazo-oxide (itself obtd. in 95% yield (3) from 4-chloro-2-nitronaphthylamine-1 with HNO_2) on boilg. with Al powder in EtOH for 19 hrs. (84% yield (4)) or (less advantageously) with Na_2SnO_2 (4) see indic. refs.]

NaĀ is spar. sol. in cold aq 10% NaOH (4).

[$\bar{C}$ with alc. NaOH + $CHCl_3$ (3:5050) undergoes Reimer-Tiemann reaction giving (but in very small yield (2)) 4-chloro-2-hydroxynaphthaldehyde-1, m.p. 118° (2).]

$\bar{C}$ (in alk. soln.) with diazotized aniline gives (4) 4-chloro-1-benzeneazonaphthol-2, or-red ndls. from acetone, or crimson ndls. from chlorobenzene, m p. 165° (4) (note that after fusion and resolidification this prod. has m.p. 151° but after a second resolidification (at about 155°) remelts on slow htg. at 165° (4)). [For use of $\bar{C}$ in prepn. of azo dyes by coupling with *o*-hydroxydiazonium salts see (5).]

—— 4-Chloro-2-naphthyl methyl ether: pl. from lt. petroleum, m.p. 44–45° (4). [From $\bar{C}$ with Me_2SO_4 + aq. NaOH (4).]

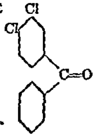
Ⓓ **4-Chloro-2-naphthyl acetate**: pl. from aq. MeOH or lt. petroleum, m.p. 58–59° (2), 56° (4) [From $\bar{C}$ with excess Ac_2O refluxed 30 min. (90–100% yield (2)).]

Ⓓ **4-Chloro-2-naphthyl benzoate**: ndls. from alc., m.p. 83–84° (2).

3:3045 (1) Fries, Schimmelschmidt, *Ann.* **484**, 293 (1930). (2) Burton, *J. Chem. Soc.* **1945**, 280–283. (3) Hodgson, Birtwell, *J. Chem. Soc.* **1943**, 322. (4) Hodgson, Birtwell, *J. Chem. Soc.* **1943**, 468–469. (5) Herzberg, Wunderlich (to I.G.), Ger. 459,889, May 18, 1928; *Cent.* **1928**, II 395; not in *C.A.*

3:3070 3,4-DICHLOROBENZOPHENONE

(3,4-Dichlorophenyl phenyl ketone)



$C_{13}H_8OCl_2$ Beil. S.N. 652

M.P. 104–105° (1)
102–103° (2) (3)

Cryst. (from alc. (1)).

[For prepn. (79.5% yield) from *o*-dichlorobenzene (3:6055) + BzOH (1:0715) + $AlCl_3$ see (1); for prepn. from *o*-dichlorobenzene (3:6055) + BzCl (3:6240) + $AlCl_3$ see (2) (3).]

Ⓓ **3,4-Dichlorobenzophenone oxime:** m.p. 153–154° (1). [This oxime upon Beckmann rearr. with H_2SO_4 gives (1) 3,4-dichlorobenzanilide which can be hydrolyzed to 3,4-dichlorobenzoic ac. (3:4925), m.p 207–208° (1), and aniline]

3:3070 (1) Newton, Groggins, *Ind. Eng. Chem.* **27**, 1398 (1935). (2) Böeseken, *Rec.* **27**, 15 (1908). (3) Kraay, *Rec. trav. chim.* **49**, 1085 (1930).

3:3100 4-CHLORORESORCINOL

$C_6H_5O_2Cl$ Beil. VI — VI_1— VI_2-(818)

M.P. 105° (1) (10)
102° (2)

B.P. 259.5° (2)
255–256° (4)
147° at 18 mm. (1)

The nature of the cpd., m.p. 89°, and formerly (3) thought to be C̄, is still in doubt, cf. (1).

C̄ is very sol. in aq. and *not* volatile with steam (1); eas. sol. aq., alc., ether, C_6H_6, and CS_2 (4).

[For prepn. of C̄ from resorcinol (1:1530) by actn. of SO_2Cl_2 in ether (95% yield (1)) see (1) (4).]

C̄ with $FeCl_3$ gives a blue-violet soln. becoming brown on warming (4).

C̄ reduces NH_4OH/$AgNO_3$ on warming (4).

C̄ on further chlorination with SO_2Cl_2 (no details) gives (96% yield (1)) of 4,6-dichlororesorcinol (3:3380).

C̄ (10 g.) refluxed with $KHCO_3$ (40 g.) in aq. (50 ml.) for 1½ hrs. gives (76% yield (5)) of 5-chloro-2,4-dihydroxybenzoic acid (6), cryst. from hot aq., m.p. 224–225° cor. (6), 215–216° (Maquenne bloc) after drying at 100–105° (5) (6).

C̄ in AcOH treated with xanthydrol (1:5205) yields 4-chloro-2-(?)-xanthydrylresorcinol, cryst. from C_6H_6, m p. 215° (7).

[For studies on prepn. of alkyl ethers of 4-chlororesorcinol for use as antiseptics and germicides see (8); for use of C̄ in prepn. of purpurin (1,2,4-trihydroxyanthraquinone) by reaction with phthalic anhydride, H_2SO_4 + H_3BO_3, see (9)]

[For coupling of C̄ with diazotized aniline, *p*-nitroaniline, or *p*-toluidine see (11).]

Ⓓ **4-Chlororesorcinol diacetate:** m.p. 46–47° (10).

Ⓓ **4-Chlororesorcinol dibenzoate:** m.p. 66° (10).

[*See also 2-chlorobenzoquinone-1,4* (3:1100).]

Colorless lfts from $CHCl_3$ in which Č is eas sol. hot but spar. sol. cold. — Very eas. sol. aq., alc., or ether; sol. in warm C_6H_6 (*dif.* from hydroquinone (1:1590) and use in sepn. from latter (1)). — Not sublimable (5)

[For prepn. of Č from 2-chlorobenzoquinone-1,4 (3:1100) by reductn. with aq. SO_2 (2) (9) see indic. refs. (note, however, that in dil. aq NaOH under N_2 both reductn. and sulfonation occur (10)); from benzoquinone-1,4 (1:9025) with conc. HCl (11) (2) or in $CHCl_3$ with HCl gas (100% yield (12)) (2); from sodium benzoquinonesulfonate (5) with conc HCl below 20° (55% yield (5)) in CO_2 see indic. refs.; from *p*-benzoquinone dichloride (2,3-dichlorocyclohexen-5-dione-1,4) [Beil. VII-573] by reductn with $SnCl_2$ + HCl at 0° see (4); from hydroquinone (1:1590) in CCl_4 with Cl_2 see (13).]

[Č is used as a photographic developer under name "Adurol" (for identification of Č in developers see (1)); Č forms an addn. cpd. (14) with 2 moles *p*-(methylamino)phenol also used as developer under name Chloranol; for use of Č as vulcanization accelerator see (15); for use of Č as antioxidant (16) and as gum inhibitor in cracked gasoline (17) or in aq. emulsion as insecticidal spray (18) see indic. refs.; for study of bactericidal actn. see (19).]

Č on oxidn. with $NaClO_3$ + H_2SO_4 + V_2O_5 in AcOH (92% yield (20)), with $K_2Cr_2O_7$ + H_2SO_4 (yield: 89% (21), 84% (8)) (2), with MnO_2 + dil. H_2SO_4 (56% yield (8)), or with PbO_2 in C_6H_6 (22) gives 2-chlorobenzoquinone-1,4 (3:1100). [For studies of oxidn.-reductn. potential of this system and also for the intermediate quinhydrone see under the quinone (3:1100).]

[For reactn of Č with phthalic anhydride + conc. H_2SO_4 at 130–135° see (2); for reactn. of Č with naphthalene-1,2-dicarboxylic acid anhydride (23) or with naphthalene-2,3-dicarboxylic acid anhydride (24) each fused with $AlCl_3$ + NaCl see indic. refs.]

Č in AcOH with xanthydrol (1:5205) yields (25) 2-chloro-3-xanthydrylhydroquinone, cryst. from C_6H_6, m.p. 236–237° (25).

Č gives *no effervescence* with aq. 10% Na_2CO_3 but soln. darkens on stdg. (1); Č with aq. 5% $AgNO_3$ scarcely reduces in cold but does so rapidly on warming (1); Č with 10% aq. $FeCl_3$ gives red-brown color in cold and on boilg. pronounced quinone-like odor (1).

Ⓓ **2-Chlorohydroquinone diacetate:** pr. from dil. alc., m.p. 99° (1) (26), 72° (2), 71–72° (27), 70.5° cor. (3) [From Č with Ac_2O (2) or AcCl (26).] [Note that a monoacetate, m.p. 62° (28) has been reported, but the reason for the wide divergence in the m.p.'s reported for the diacetate has not been explained.]

Ⓓ **2-Chlorohydroquinone dibenzoate:** fine woolly ndls. from mixt. of alc. + ether, m.p. 130° (2). [From Č on refluxing with BzCl (2).]

Chem. Soc. **1934**, 680. (17) Betts, Hammett, *J. Am. Chem. Soc.* **59**, 1568–1572 (1937). (18) Kindler, *Ann.* **452**, 108 (1927). (19) Mehner, *J. prakt. Chem.* (2) **62**, 560–565 (1900). (20) Menon, *J. Chem. Soc.* **1936**, 1775–1777.

3:3140 2,3,4,5-TETRACHLOROBENZALDEHYDE $C_7H_2OCl_4$ Beil. S.N. 635

M.P. 106–106.5° (1)

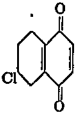
[For prepn. of C̄ from 2,3,4,5-tetrachlorobenzal (di)chloride (3:9397) by hydrolysis (presumably with strong H_2SO_4) see (1).]

C̄ with $NaHSO_3$ forms the corresp. addn. cpd. which may be used as means of sepn. of C̄ from 2,3,5,6-tetrachlorobenzaldehyde (3:2700).

[For use of C̄ in prepn. of dyestuffs see (1).]

3:3140 (1) Chem. Fabrik Griesheim-Elektron, Brit. 251,511, May 27, 1926; *Cent.* **1926**, II 2355; [*C.A.* **21**, 1361 (1927)]: French 603,650, April 20, 1926; *Cent.* **1926**, II 2355; not in *C.A.*

3:3145 6-CHLORONAPHTHOQUINONE-1,4 $C_{10}H_5O_2Cl$ Beil. S.N. 674

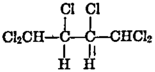


M.P. 106–107° (1)

[For prepn. of C̄ from benzoquinone-1,4 (1:9025) by addition of 2-chlorobutadiene-1,3 ("Chloroprene") (3:7080) and subsequent oxidation of the resulting Diels-Alder type adduct see (2); for formn. of C̄ by oxidation of various dichloronaphthalenes see (1).]

3:3145 (1) Kozlov, Talybov, *J. Gen. Chem.* **9**, 1827–1836 (1939); *C.A.* **34**, 4067 (1940). (2) Carothers, Collins (to du Pont Co.), U.S. 1,967,862, July 24, 1934; *Cent.* **1936**, I 2209; *C.A.* **28**, 5994–5995 (1934).

3:3155 1,1,2,3,4,4-HEXACHLOROBUTANE $C_4H_4Cl_6$ Beil. S.N. 10



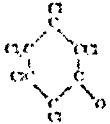
M.P. 107° (1) (2)

[For isolation of C̄ from the high-boilg. fraction resulting in the preparation of trichloroethylene (3:5170) from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) see (1) (2); long refluxing (20 days) of freshly distilled samples of the latter compound also yields (1) C̄.]

C̄ on boilg. with alc. $Ca(OH)_2$ or with alk. at room temp. loses 2 HCl yielding (1) the liquid stereoisomer (3:6150) of 1,2,3,4-tetrachlorobutadiene-1,3. [The solid stereoisomer (3:0870) was *not* obtained from C̄ (1).]

3:3155 (1) Müller, Hüther, *Ber.* **64**, 589–600 (1931); *C.A.* **25**, 3956–3957 (1931). (2) Ghighi, *Ann. chim. applicata* **28**, 363–368 (1938); *Cent.* **1939**, I 86; *C.A.* **33**, 6792 (1939).

3:3180 HEXACHLOROCYCLOHEXADIENE-2,4-ONE-1 (Hexachloro-[illegible])



C_6OCl_6 Beil. VII - 144; VII_1-(96)

M.P. 107° (1) (3) (4)
106° (5) (6)

Cryst. from $CHCl_3$ or CS_2, white rods from pet. eth. (1) — [illegible] aq., spar. sol. cold alc., mod. sol. C_6H_6, very eas. sol. $CHCl_3$ or pet. eth. (4)

[For prepn. by various methods see Beil. VII-144 + Beil. VII_1-(96); for recent prepn. by chlorination of phenol see (2).]

Č with aq. KI (1) or Zn dust in boil. alc. (1), or $SnCl_2$ + HCl in AcOH (100% yield) (2) (5) or even with conc. aq. or alc. KOH (1) yields pentachlorophenol (3:4850).

Č (4 g.) [illegible] added to conc. HNO_3 (20 g.) with warm. [illegible] and the product [illegible] poured into aq. [illegible] recrystd. from nitrobenzene, yields (5) tetrachloro-p-benzoquinone (chloranil) (3:4250), m.p. 290° (5)

Č melted with conc. H_2SO_4 (then [illegible]) [illegible] with shaking until reaction suddenly begins, evolves HCl and on cooling [illegible] (see above) separates (2)

3:3180 (1) Barton, McCombie, J. Chem. Soc. 1931, 144. (2) Britton, Mattis, Alquist, Harold (to Dow Chem. Co.), U.S. 1,907,036, Aug. 7, 1934; Cent. 1935, I 2464. (3) Langer, Ann. 215, 121 (1882). 3:3200 1,5-DICHLORONAPHTHALENE

$C_{10}H_6Cl_2$ Beil. V - 543; V_1-(262); V_2-(440)

M.P. 107°	(1) (6) (7) (9) (10)
106.5-107°	(3)
106.5°	(2) (24)
106-107°	(4)
105-107°	(5)

Ltts. from alc. or AcOH. — Sublimes in very broad thin pr. — [For use as wood impregnant see (22).]

[For prepn. of Č from 1,5-dinitronaphthalene [Beil. V-558, V_1-(274)] (6) (2), from naphthalene-1,5-disulfonyl chloride [Beil. XI-212] (50% yield (4)) (7) (8), from 5-chloronaphthalene-1-sulfonyl chloride [Beil. XI-161] (9) (2), from 5-chloronaphthol-1 [Beil. VI-612] (10) by htg. with PCl_5, see indic. refs.; from 5-chloronaphthylamine-1 [Beil. XIV-741, XIV_1-(733)] by htg. corresp. diazonium salt with 2 moles PCl_5, see (1) (11); from 1,5-dichloro-7-aminonaphthalene by replacement of $-NH_2$ by $-H$ see (12); from 1,5-dichloronaphthalene-sulfonic acid-2 [Beil. XI-181] by hydrolysis of $-SO_3H$ group see (13) (14); from 4,5-dichloronaphthalene-2-sulfonyl chloride [Beil. XI-182] or from 1,5-dichloronaphthalene (3:2135) by htg. with conc. HCl in s.t. at 290° see (15); from naphthalene (1:7200) in CCl_4 at −10 to 0° with Cl_2 in pres. of Fe (together with other products) (16) or from 1-

nitronaphthalene [Beil. V-553, V_1-(264)] with Cl_2 (together with other products) (17) (2) see indic. refs.]

[C̄ in $CHCl_3$ soln. satd. with Cl_2 gives (25) both 1,5-dichloronaphthalene tetrachloride, m.p. 84°, and a trichloronaphthalene dichloride, m.p. 94° (separated by spar. soly. of latter in MeOH).]

[C̄ on mononitration yields (10) 1,5-dichloro-8-nitronaphthalene [Beil. V-556], yel. pr. from AcOH, m.p. 142° (10) (17) (23); note that the isomeric 1,5-dichloro-3-nitronaphthalene, m.p. 132°, has been reported indirectly (23) (12).]

[C̄ on monosulfonation (18) (13) gives chiefly 1,5-dichloronaphthalenesulfonic acid-3 [Beil. XI-183, XI_1-(41)] (corresp. sulfonyl chloride, m.p. 143° (13), corresp. sulfonamide, m.p. 204° (24)) accompanied by a smaller amt. 1,5-dichloronaphthalenesulfonic acid-2 [Beil. XI-181] (corresp. sulfonyl chloride, m.p. 125° (13)).]

[C̄ with picric acid yields a cpd. C̄.PkOH, m.p. 87° (10).]

[C̄ on oxidn. with CrO_3/AcOH yields (19) 3-chlorophthalic acid (3:4820) but on oxidn. with dil. HNO_3 yields (20) a nitro-chloro-phthalic acid.] [C̄ on cat. vapor-phase oxidn. (21) gives 80% yield 3-chlorophthalic anhydride (3:3900) + 20% phthalic anhydride (1:0725).]

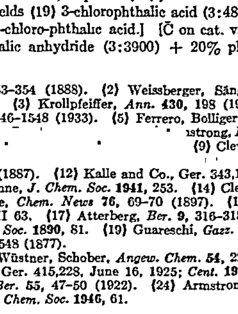
3:3220 PARA-α-CHLORO-ISOBUTYRALDEHYDE (2,4,6-*tris*-(α-Chloro-isopropyl)-trioxane-1,3,5) $C_{12}H_{21}O_3Cl_3$ Beil. XIX - 391 XIX_1—



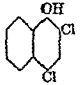
M.P. 107° (1) (2)

Odorless tasteless ndls. (from distn. with steam); pr. (from ether); insol. aq.; sol. alc., ether, pet. ether. — Sublimes above m.p.

[For prepn. from α-chloro-isobutyraldehyde (3:7235) by shaking with ½ vol. conc. H_2SO_4 see (1) (2).]

3:3220 (1) Brochet, *Ann. chim.* (7) **10**, 357–359 (1897). (2) Brochet, *Bull. soc. chim.* (3) **7**, 643–644 (1892).

3:3250 2,4-DICHLORONAPHTHOL-1 $C_{10}H_6OCl_2$ Beil. VI - 612
VI₁-(308)
VI₂-(582)



M.P. 107–108° (2) (3)
106–107° (1) (5)

Ndls. (from dil. alc or lgr); from AcOH C̄ separates in pr. with 1 mole of AcOH rapidly lost at 40–50° (1). — C̄ is volatile with steam; eas. sol. abs. alc. ether or C_6H_6. — C̄ on htg. to 180° decomposes with loss of HCl.

[For prepn. from β-naphthol (1:1500) (1) (2) or 4-chloronaphthol-1 (3:3720) (4) by chlorination see (1) (2) (3); from naphthalene 1,2,3,4-tetrachloride (3:4750) by oxidn. with CrO_3 in AcOH see (5); for other methods see Beil. VI-612]

C̄ dissolves in NaOH or Na_2CO_3 but on warming (or even long stdg. in cold) yields (6) ultramarine flocks which impart to ether a violet, and to benzene a deep blue violet, color (6). [Same result obtd. with $K_3Fe(CN)_6$ but not with pyridine (6).]

C̄ on boil. with dil. HNO_3 is oxidized (1) to phthalic ac. (1:0820); but with CrO_3 in AcOH yields 2-chloronaphthoquinone-1,4 (3:3580), volatile with steam, golden-yel. ndls from aq., alc., or AcOH, m.p. 116° (1).

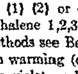
C̄ is not affected by Sn + alc. HCl (3), or Na/Hg (3), but on htg. in AcOH with conc. HI (D = 1.7) for 10 hrs. gives (3) α-naphthol (1:1500).

C̄ dislvd. in 20 pts. 15% aq. KOH and shaken with 4 pts. $(CH_3)_2SO_4$ gives (94% yield (3)) of the methyl ether, methyl 2,4-dichloro-1-naphthyl ether, colorless ndls. from alc., m p. 58° (3).

D **2,4-Dichloro-1-naphthyl acetate:** from C̄ by htg. with AcCl (2); ndls. (from alc.), m.p. 74–76° (2).

3:3250 (1) *Cleve, Ber.* **21**, 891–893 (1888) (2) Zincke, *Ber.* **21**, 1035–1036 (1888). (3) Franzen, Stäuble, *J. prakt. Chem.* (2) **103**, 384–385 (1921/22). (4) Reverdin, Kauffmann, *Ber.* **28**, 3053 (1895). (5) Helbig, *Ber.* **28**, 506 (1895). (6) Willstätter, Schuler, *Ber.* **61**, 370 (1928).

3:3275 6-CHLORO-2-METHYL-BENZOIC ACID $C_8H_7O_2Cl$ Beil. S.N. 941



M.P. 108° (1)
102° (2)
[91.5° (3)]

Long slender colorless ndls. from hot aq. (2) or from HCl (1).

[For prepn. of C̄ from 6-chloro-2-methylbenzamide (see below) (itself obtd. from 6-chloro-2-methylbenzonitrile, m p. 82–83° (2)) by actn. of nitrous acid see (2); from 6-amino-2-methylbenzoic acid (1) via diazotization and use of Cu_2Cl_2 reactn. see (1) (3).]

C̄ on htg. with aniline, K_2CO_3, and copper powder yields (1) 3-methyldiphenylamine-carboxylic acid-2, cryst. from 50% alc., m.p. 145° dec. (1).

[C̄ melted and treated with Br_2 evolves HBr, and the prod. on warming with dil. NaOH yields (3) 3-chloro-α-hydroxyphthalide, colorless pl. from dil. alc., m p. 138° (3).]
